— THE LAGO MAGGIORE. — We understand that the beautiful estate of Prince TROUBETZKOY, at Intra, near Pallanza, some twenty hours from Paris, and two from Milan, is for immediate sale. An account of the Prince's garden, with illustrations, was given in our columns in 1874 and again in 1877. Apart from the singular beauty of the site these gardens have gained great reputation from the numerous experiments in introducing new and valuable plants made by the proprietor, especially Eucalypts, including *A. amygdalina*, specimens of which, sown in 1870, have now attained a height of 25 metres, and a circumference of 2½ metres. The garden, which com-

bility of consulting the authentic specimens. The removal of the herbarium to Paris will obviate this difficulty.

— HAIR OR NO HAIR. — In a recent issue we had occasion to mention the curious case of the *Greyia*, some of the leaves of which are glabrous, others hairy on the same shoot. Almost equally marked is the prevalence of the downy variety of the common *Ling*, *Calluna vulgaris*, growing side by side with the common form, as on the Surrey heaths, where the conditions are the same for both.

— COPPER IN WINE. — The treatment of mildew in Vines by means of a solution of sulphate of copper, which has been adopted so successfully in France, has raised some doubts as to the wholesomeness of the wine made from Grapes so treated. In consequence, says the *Vigne Americaine*, M. MASSOL, of the School of Pharmacy of Montpellier, has

Colombian bark. In 1881 the value of the bark exported was about 2,000,000 dollars. It is estimated that since 1881 not half the quantity exported in that year has been shipped yearly.

— THE PHILOSOPHY OF VINE PRUNING. — The production of grains of starch in the chlorophyll of the leaves when exposed to the sun is a well-established fact. This starch is subsequently dissolved, converted into sugar and other substances fit for the food of plants, and transmitted to the growing points or to the store-places, where it is again converted into starch. The production of starch in leaves is shown by immersing the leaves in boiling water, to which a little potash is added, and then plunging them for a quarter of an hour in hot alcohol. The leaves are by these means deprived of their green colour, and the starch in them is now easily rendered visible by the addition of tincture of iodine. By covering one-half of the leaf with some

FIG. 116. — PRIMULA HIRSUTA ALLIONI: FLOWERS ROSE-PINK. (SEE P. 595.)

(From a coloured figure of H. Sendtner's of Munich.)

mands on one side a view of the Simplon, and on the other of the lake, occupies the side of a hill sloping to the lake, the foreshore of which, for 500 metres, belongs to the property, and is well adapted for numerous villa residences, hotels, &c., though for our own parts we should greatly prefer that the garden be kept for its present purposes and not defaced by bricks and mortar. At present there are two or three elegant and well appointed Swiss chalets on the property. The climate is nearly as mild as that of Nice in winter, while in summer it is fresh and cool.

— LAMARCK'S HERBARIUM. — We learn from *Nature* that the authorities at the Jardin des Plantes have purchased from the University of Rostock the herbarium of LAMARCK, which belonged to the late Professor REPER. At Rostock this herbarium has been, as it were, lost to science, which was the more to be regretted as LAMARCK was, in many ways, the predecessor of DARWIN, while the determination of the species described by him in the *Encyclopédie Methodique* was rendered difficult from the impossi-

analysed several samples of the wine, which he finds entirely free from copper. Traces of this metal were, however, found in the "marc," or pressed skins from which vinegar is made, and similar traces in the vinegar itself.

— CAPERS. — *Après* of Capers figured in the last issue of the *Gardeners' Chronicle*, a good story has been latterly put in circulation to the effect that some emigrant passengers from the Emerald Isle complained to the captain on the hardship inflicted on them by having served up with their boiled mutton what they termed "sour pasc."

— CINCHONA BARKS IN COLOMBIA. — In a recently issued report on the trade of Colombia, the Consul states with a view of illustrating the alarming depression of the export trade of Colombia, that the exportation of Quina bark, which was the staple article of Colombia, has greatly diminished in consequence of the competition of the Indian and Ceylonese growers, who produce an article which yields a far larger percentage of quinine than is obtained from the

opaque substance, leaving the other half exposed to the sun, starch may be detected in the uncovered half, while none is to be found in that which has been shielded from the sun's rays. Signor CUBONI, who has made numerous experiments on the Vine, says that this production of starch increases gradually from the leaves at the base of a young shoot to the middle, and as gradually diminishes from the middle towards the point, starch being absent from the very young leaves near the apex. These facts supply a reason for pruning, for the young leaves above the flower bunches, not producing starch, but on the contrary consuming it, so far deprive the berries of their sugar.

— TOMATOS AND VINES. — If science has its marvels which, however well attested, often fail to convince, certainly neo-science has sometimes even greater marvels, which nevertheless are accepted as gospel by some folk. At one time, year after year, we received from a correspondent leaves of Violets affected with a fungus (*Puccinia violæ*). The leaves thus had a superficial resemblance to those of a Fern

studded with spore-cases, and as the Violets grew beneath the shade of some Ferns was not that proof positive that a cross had been effected between the Fern and the Violet? It was no use appealing to structural and physiological reasons why such a cross could not be. Nothing could shake our correspondent's faith, and year after year, with an expression of surprise and pity at our incredulity, the specimens were sent. As we write a multiple Grape berry is before us such as often occurs at the end of the bunch, when two or three Grapes, from union in a very early stage of development, run together into a mass lobed like a Tomato. Now, as Tomatos grew in the house, what more natural (?) than to infer that here we have a cross between a Tomato and a Vine? It would not be so unlikely as a cross between a Fern and a Violet, nevertheless we should be as incredulous in the one case as in the other.

— **THUIOPSIS DOLABRATA**.—It is interesting to see in nurseries the variations in colour of this hardy shrub. Some retain their green colour throughout the year, while others assume a rich brown tinge like some of the *Thuias*.

— **ROYAL MICROSCOPICAL SOCIETY**.—The next meeting of this Society will be held on Wednesday, the 19th inst., at 8 o'clock precisely, when the following papers will be read:—Mr. S. O. RIDLEY—"Classification and Spiculation of the Monaxonid Sponges of the *Challenger*;" Mr. A. DENDY—"Anatomy and Physiology of the Monaxonid Sponge of the *Challenger*;" Dr. CROOKSHANK—"On the *Sarra Parasite*."

— **RAMIE FIBRE IN SPAIN**.—Mr. Consul WOODBRIDGE, reporting from Barcelona, refers to the opening in August last, near Gronoa, of a manufactory, the first of its kind in Spain, for cutting and separating the fibres of the Ramie, or Cunia-grass plant (*Bomheria nivea*). This establishment is described as the property of a French company, styling itself the "Compagnie Ramie Française." This plant was introduced into the country as far back as 1870, and its cultivation proving a success, the above manufactory has been erected. There are three machines at present, of French manufacture, at work, which decorticate some 450 kilos of fibre per day, and the thread is said to be much cheaper, finer, and stronger than either hemp or jute, and produces a rich, glossy textile, and the refuse is used in the manufacture of paper.

— **SEEDS, &c.** : EDINBURGH INTERNATIONAL EXHIBITION.—Messrs. SUTTON & SONS, of Reading, have received the award of a Gold Medal for their fine display of seeds, grasses, models, &c., at this Exhibition.

— **PACKING PEARS**.—The French, who export more Pears than any other nation, cover the inside of the boxes with spongy paper or dry moss, which absorbs the moisture. Each Pear is then wrapped in soft paper, and placed in layers in the boxes, the largest and least mature in the bottom, filling all interstices with the dry moss. Thus, they will keep a month or more. They are so closely packed that though they cannot touch each other, all motion is prevented. If one decays the others are not harmed.

— **PEPPERMINT CULTURE IN JAPAN**.—As an indication of the increased demand for Menthol in Europe the following extract from Consul ROBERTSON'S report on the trade of Kanagawa for the year 1885 will no doubt be read with interest:—"Peppermint oil has been an article that has attracted much attention in the past year because of its increasing importance as an article of export. The production has been steadily increasing for the past three years, and the latest crop has greatly exceeded those of previous years. This is principally due to the demand for crystals, a product of the liquid oil, and which are now largely used in pharmacy as a specific for neuralgia and other complaints. Japanese Peppermint oil is distilled from a species of Mint (*Mentha arvensis*) cultivated largely in the northern portion of the main island of Japan. Like the English Mint (*Mentha piperita*) there are several varieties of the Japanese plant, one only of which produces an article of good quality. The sudden and increased demand from abroad for the Peppermint crystals has led to new plantations being formed, and these have, I am told, been for the most part laid out with

inferior plants. The produce of these new plantations has been sold at very low prices, and the oil thus obtained is not likely to be of good quality. If this is sent to a foreign market it will, perhaps, cause the Japan oil to be regarded with less favour, and thus damage the prospect of an otherwise promising export." Some blundering seems to have been made in printing this report which it would be well for the authorities carefully to look after in future. Though the report is issued under the authority of the Foreign Office, and is "printed under the superintendence of Her Majesty's Stationery Office," and is dated "Kanagawa, May 28, 1886," and further bears the word Japan on its title-page, the heading of every alternate page is "China, Kanagawa." Some one, therefore, whose duty it is to look after these things has apparently a hazy notion as to the country to which Kanagawa belongs.

— **THE CORSICAN PINE**.—Mr. E. M. ARCHDALE, Crook-na-Crievie, Ballinamallard, says, in the *Irish Farm, Forest, and Garden* as follows:—"As the planting season is now near at hand, I would warn any of your readers against planting Corsican Pine (*Laricio*), under the impression that rabbits will not touch it. For the last three years I have planted it, getting it from different seedsmen each time, and it has always been the first attacked by rabbits, who seem to prefer it even to the Ash."

— **FRUIT LABEL HOLDERS**.—At South Kensington on October 20 several of the Canadian fruit exhibitors made to the Royal Horticultural Society, through the Fruit Committee, a present of several hundreds of stout wire label holders for dishes of fruit or other things needing names on show tables. Like so many Transatlantic "notions" these holders are very diverse from ours. Each one has a base formed of a ring of wire to stand in the plate, and from the centre rises a single stem some 10 inches high having upon the top a spring holder for the name card erect, and another to grip the prize card, if any, hanging beneath. The arrangement is an admirable one. The present was cordially accepted by the committee.

— **MANURING CINCHONAS**.—It has been a question whether the application of manure would increase the yield of quinine in the bark. According to the Government quinquologist at Madras this question is now settled. Comparative experiments show a gain of from 20—50 per cent. in favour of manured trees. Moreover, the increased yield more than covers the cost of the manure, so that the process is not only physiologically but commercially profitable.

— **MAHOGANY IN INDIA**.—The success that has attended the raising of Mahogany plants from the last consignment of seeds sent out by the Kew authorities shows that some other and better method was adopted in packing and sending out the seeds, which, Mr. LAWSON says, "arrived in magnificent order." It would have been useful to have given publicity to the system of packing. The seeds were distributed chiefly to the Forest Department and to the local Agricultural Society. "Almost every seed germinated," says Mr. LAWSON, "and tens of thousands of plants must have been raised. From a single pound of seed sown in the greenhouses at Ootacamund, between 3000 and 4000 plants were obtained." This is very gratifying, and efforts ought to be made to distribute the plants widely for trial in all parts of the country suited to the growth of Mahogany.

— **ALCOHOL FROM THE PRICKLY PEAR**.—Don FERNANDO DE LA CAMARA, a member of the Society of Natural and Physical science at Malaga, has been experimenting for over a period of twelve years with this plant (*Opuntia vulgaris*), and has at length obtained results which may be regarded as being satisfactory. He states, in rocky ground at Malaga 2600 Figs, weighing about 13 kilos, are an average crop on 10 square metres, and the proportion of spirit obtained from the juice amounts to about 8 per cent.

— **LONDON CORN EXCHANGE**.—A *Chrysanthemum* show was held at the Exchange in Mark Lane, E.C., on November 2 and 3, in aid of the Benevolent Society of the Exchange. The classes, which were very numerous, were for cut blooms only, and were restricted to *bona fide* amateurs who were engaged at work in London, with the exception of that for twelve incurved and twelve Japanese blooms, which was open.

The blooms were very good, and reflected great credit on the competitors. In the open class Mr. J. Bettesworth, gr. to R. Ewing, Esq., Barton Grange, Cheshunt, was 1st, with uniformly good blooms; Mr. J. P. Kendal, was 2d. The chief prizetakers in the other classes were Messrs. T. W. Jones, G. Lambert, O. T. Hodges, J. Spicer, F. Woodley, John Aste, A. Macgetton, and J. P. Kendall. A collection of fine blooms was staged by Mr. N. Davis, Lilford Nurseries, Camberwell, S.E., this was very fine as regards the Japanese varieties.

— **TOBACCO IN LOANDA**.—Referring to the cultivation of Tobacco in Loanda, the British Consul reports that the plants are carelessly grown and gathered by the natives. When the leaves are sufficiently matured they are plucked from the stem, tied in bunches, and hung round the native huts to dry. No care is taken, no selection made, nor is any preparation resorted to beyond the bunching and drying.

— **A TRAP TO CATCH A DROP OF WATER**.—M. VOLKENS describes a remarkable adaptation of means to an end in the case of some Egyptian desert plants, such as *Reaumuria*, *Tamarix*, &c. In these plants a number of glandular hairs are produced in little basin-like depressions on the leaves. These glandular hairs secrete a bitter crystalline substance, which exudes and covers the whole surface of the leaf. During the night this saline matter attracts the dew and moisture from the atmosphere, and the plant becomes saturated with moisture.

— **LUFFAS IN JAPAN**.—Reporting on the trade and commerce of Hiogo for the year 1885, Mr. Consul TROUP says:—"A new article of miscellaneous export has lately been in some request—the fibrous part of the Snake Gourd—called by the Japanese 'Suchima,' and in commerce 'Luffra.' Ordinarily exported to Europe for use as a bath rubber, it has, I believe, come now to be used as padding in the manufacture of *Sola* hats. It is used by the Chinese as padding for the soles of shoes." The plant here referred to is apparently not the Snake Gourd as understood by *Trichosanthes anguina*, but is the *Luffa*, or *Loolah* (*Luffa acutangula*), the vascular portion of the fruit of which is now so much used as a flesh brush.

— **MRS. JOHN LEE**.—The numerous friends of Mr. JOHN LEE will sympathise with him in the recent death of his wife, who died at Warwick Road, Kensington, on Friday, October 29, after a few days' illness.

— **DESERT PLANTS**.—M. VOLKENS has been studying the plants of the Egyptian desert, and their means of adapting themselves to the very dry climate. One of the principal characteristics resides in the great length of their roots, which in some cases are twenty times longer than the above-ground parts. The leaves of a Gourd remain fresh while still attached to the plant owing to this abundant root-development, but if a leaf be removed from the plant it shrivels in a few minutes.

— **TRENTHAM GARDENS**.—We are informed that Mr. PETER BLAIR, a son of the respected gardener at Shrubland Park, Ipswich, has been appointed to the post of head gardener, rendered vacant by the lamented death of Mr. STREYENS. During the illness of the latter Mr. BLAIR, who was foreman of a department at Trentham, had the general superintendence of the gardens. With so thorough a training in horticultural pursuits as would almost as a matter of course fall to the lot of the son of the gardener at Shrubland, we may believe that the gardens at Trentham will be maintained at their present high state of culture. Mr. BLAIR had the great misfortune to mourn the loss of his wife quite recently.

— **PUBLICATIONS RECEIVED**.—*The Camera*, No. 6. (London: WYMAN & SONS, 74, 76, Great Queen Street, W.C.)—*The Coming Deluge of Russian Petroleum*. By C. MARVIN. (London: R. ANDERSON & CO., 14, Cockspur Street.)—*Chrysanthemums and their Culture*. By E. MOLYNEUX. (London: 171, Fleet Street, E.C.)—*The Forces of Seedlings*. By Sir JOHN LUBBOCK, Bart., M.P., &c.; also *The Sympathetic Nervous System*. By W. H. GASKELL, M.D., F.R.S. (Royal Institution of Great Britain.)

— **GARDENING APPOINTMENTS**.—Mr. R. C. WILLIAMS, Foreman in the gardens of HOWELL GWYN, Esq., The Duffryn, Neath, South Wales, has been appointed Head Gardener to the Earl of LISBURN, Cross Wood Park, Ayrshire.

PRIMULA HIRSUTA ALLIONI.

THE Primrose of which we give an illustration is undoubtedly amongst the most charming of our spring alpine flowers for rockery decoration. It is considered by most botanists in this country, if not synonymous, as a mere variety only of *P. viscosa*, which is also made to include *P. villosa*, *P. commutata*, *P. latifolia*, *P. decora*, *P. pedemontana*, and a host of others, no less beautiful and useful in the way indicated above. The Continental botanists, however, many of whom have studied these plants both growing wild and under cultivation, prefer keeping them distinct, having a separate place for *P. hirsuta*, *P. villosa*, *P. ciliata*, and all the others above enumerated; none of them seem to agree with our lumping system, and it is doubtful whether, in a genus like that of Primulas, where the characters of the European kinds (excepting Primulastrums) are so constant, the separation policy may not, after all, turn out to be the best; at any rate, our nurserymen do not seem in a hurry to leave off following Continental nomenclature. All the Primroses of the Erythrodosm type, to which the illustration (fig. 116, p. 593) belongs, are comparatively easy to grow out-of-doors with us—indeed, the finest plant of *P. viscosa* we have ever seen was growing in a little rockery with a north-eastern aspect in a small suburban garden, black with soot, for which the glandular-tipped hairs have a great attraction; thriving it was, however, and carrying half-a-dozen heads of its pretty purple blooms.

The difficulty of procuring a cool position is not easily overcome by Southern growers; a little experience, however, will soon remove this, and with the impetus given by the late Conference, we shall soon not have to go as far as the Tyrol to see alpine Primroses at their best. The soil should be free, well mixed with stones, and the drainage perfect. Most of them are very impatient of stagnant water, hence the necessity of growing them, wherever possible, on slopes, or almost perpendicular rockwork. *P. hirsuta* is a native of Eastern Switzerland and the Tyrol, at elevations of 6500 feet above sea-level. The flowers are the largest and brightest of this set—lilac with a greyish-white centre, flowering freely from April to June, recognised from other *viscosas* by its more deeply serrate and downy leaves, and longer petioles. D.

The Apiary.

THE CANADIAN HONEY SHOW.

AS I have paid a special visit to the above show, and spent some time looking over everything there, I thought that perhaps some of the readers of the *Gardeners' Chronicle* would like to know my opinion about a few things I saw there. The Canadians have sent over to this country about 40 tons of honey, gathered during the present year. The honey is of very good quality. I do not say it is better than ours, nor do I think so, but there are many things about the show from which we can learn much. One thing seems to be certain, and that is, there will shortly be a revolution in the sizes of sections. On entering the show I was struck at once with the narrowness of the sections, and the beautiful way the bees had finished all off. In many cases the honeycomb was as flat as a marble slab and finished off completely, that is, with no popholes. Mr. S. Corneil, from Canada, explained to me how these results were obtained. First, they make their sections only 1½ inch wide, instead of 2 inches as in our country. The result is that the bees make the comb exactly as wide as the sections. As near as possible the size of their sections is 4½ × 3½ × 1½ inch. These hold, I believe about half a pound. Now there are lots of people who would buy a pretty little half-pound box for sixpence who would not spend a shilling on a pound. By numerous experiments Mr. D. A. Jones, of Canada, has proved that bees enter the narrow sections with more readiness than the wide ones. This seems likely to be the case, for bees, when left to themselves, make their combs the same width that our cousins make their sections. Mr. Jones says he can get more honey from the narrow sections than from any other, and, as our Mr. Cowan says, it would require a brave man to differ from Mr. Jones. This,

then, is a matter for serious consideration, and now is the time to consider it, and make any alteration while the bees are at rest. Mr. Corneil also put me up to a wrinkle in the matter of fixing foundation in sections. He puts a piece of foundation at the top and the bottom of the section. The pieces do not quite meet in the middle, but fill every corner of the section. When the bees have completed just past the middle the section crate is reversed, and the remainder of the business is completed with incredible speed. Mr. Corneil uses queen-excluder zinc between the frames and the crate, but this is not generally done in our country now. I could have said much more about the show had I space, but I have touched on a few of the most salient points. Walter Chitty, *Penny.*

NOTE ON SOME BEES AND THE FLOWERS OF SNAPDRAGONS.

HAVING this year a great quantity of Antirrhinum majus growing together, I have made, during the month of August, many and continuous observations of the behaviour of some kinds of bees with the flowers, which in the main corroborate those of the late Mr. E. Newman, communicated to the Entomological Society (*Proceedings*, 1850, p. 36). He enumerates four kinds, but names only one (No. 1), designating the others as "Bombus—" with numbers 2 to 4; these numbers I adopt here, assuming from the identity of proceeding in the bees I have seen with that recorded by Mr. Newman that the kinds are the same; the specific names of these, and also of Nos. 5 to 7, have been kindly furnished by Mr. Edward Saunders from individuals taken in the acts mentioned.

No. 1. *Megachile centuncularis*.—This I have not seen; it is said to enter the flowers back downwards.

No. 2. *Bombus Derhamellus*, ♀.—This invariably enters the flowers back upwards, going in so completely as to be entirely hidden, and an entomological dogberry on day duty would suspect its presence. However, it soon comes out, its thorax striped with yellow pollen from the anthers, which it at once carries to fertilise another flower, and so on again and again. "Sic vis non volis" may well be said of such bees as this, which thus unconsciously have contrived a double debt to pay. Mr. Newman believed this bee to be the neuter of No. 4, and this was correct if my No. 4 be the same, of which there may be a doubt (see No. 7).

No. 3. *Bombus terrestris*, var. *lucorum*, ♀.—This does not enter the flower at all. Mr. Newman says it alights on the flower-stalk just below the flower, cuts a hole in the corolla close to the nectary, and thrusts its tongue or labial apparatus through this to the nectary. I have, however, often seen it not only act thus, but also alight on the flower, yet never attempt to enter it, but crawl at once down the outside to the base of the corolla. I thought the size of the bee might have been against its entry, but as I afterwards saw larger bees go in, this theory was defective; it therefore appeared that it sought honey only, and took the readiest way to get it. I saw no ♀ of this var.

No. 4. *Bombus Derhamellus*, ♀.—This large bee was of too great a size to get into the flower; so, standing on the lower lip, it opened the mouth of the corolla, and thrusting itself in as far as it could, thus reached the nectary, as could be seen through the sides of the tube, the posterior part of the body remaining exposed to view; when the bee came out the thorax was marked with pollen like No. 2, the ♀.

No. 5. *Apis mellifica* (Ligurian race).—This (not mentioned by Newman) goes on the outside of the flower from below and proceeds to extract the honey like No. 3. Simultaneously, however, I saw other bees of this species go to the mouth of the corolla and open it, but they did not enter; they only stood on the lower lip and pushed their heads in; and I repeatedly noticed that they reached only to the polleniferous anthers with their forelegs; so it was clear they required pollen only. I further noticed that the honey collectors went from flower to flower always on the same errand, and that the pollen gatherers acted similarly, neither taking up the occupation of the other. Here was clearly an economic division of labour.

No. 6. *Bombus terrestris*, var. *virginialis*, ♀.—This settled on the lower lip of the flower and pushed itself into the corolla as far as it could, leaving a considerable portion of its abdomen and its hind-legs in sight. This I saw repeatedly. It evidently went to

the nectary for honey, for the pollen from the anthers remained thick on the thorax, and was regarded as an encumbrance, as the bee occasionally rested on a leaf, and did its best to get rid of the dust with its forelegs. If it had intended to gather pollen it would not have acted in this way. It is very singular that to get the honey the procedure was so different from that of No. 3—another variety of the same species.

No. 7. *Bombus terrestris*, var. *virginialis*, ♀.—This also settled on the lower lip of the flower, and thrust itself as far as it could into the corolla, but being the largest of all the bees the whole of the abdomen remained in view. It evidently reached the nectary with its tongue; honey was the object of its action, for the pollen formed a large stripe on the thorax, and efforts like those of No. 6 were made to remove it. This may have been the "very large bee" mentioned by Newman as his No. 4, in which case his belief that it was the ♀ of No. 2 was incorrect.

I did not in any instance see either No. 3 or No. 5 make the hole which always existed at the base of the corolla after a bee had examined it, and so the opening once made served for every successive visitor. In Hermann Muller's work, *The Fertilisation of Flowers*,* at p. 433, the fertilisation of Antirrhinum majus by various bees is noticed, but in every case quoted the bee entered the corolla. This is the more singular, as it is said, with respect to the flowers of the allied *Linaria vulgaris*, "I have seen the honey-bee bite a hole in the spur and empty it, as Sprengel describes."

Nos. 2, 3, and 4, disappeared after September 3, at least they then came no more to the Snapdragons.

The flowers exhibited countless shades and combinations of colours, from pure white to crimson, including spots and stripes, but the bees had no preference for any, going indiscriminately from one to the other. J. W. Douglas, 8, Beaufort Gardens, Lewisham, September 10, in the "Entomologist's Monthly Magazine" for November.

FORESTRY.

NOVEMBER.

WHEN to plant, what to plant, and how to plant are questions which at the present season engross the attention of not a few landowners who are not practically acquainted with the various duties of the ordinary forester. To these three questions we will in turn give replies, but only so far as our own experience warrants us in doing.

WHERE TO PLANT.

This to a great extent depends on the quality of soil to be planted, but unless in the case of peat bog or other damp soils which we prefer to operate upon in early spring, all other planting should be well in hand, if at all possible finished, before the end of the year. Although the advantages of such a course of action are well known to be many indeed not only to the landowner but forester as well, but which advantages time will not permit of our dwelling fully upon at present, still the majority of planters cannot get rid of the old-fangled idea that spring planting is best—perhaps not best for the plants, but more suitable for themselves and their arrangements, whereas such persons by a little timely forethought and scheming could easily enough have so arranged other work that all hands could be put on the planting during the months of November and December, and when suitable weather allowed of such work being carried on without fear of harm to the young and tender plants. By pushing on planting operations at present, when there is still a little warmth left in the soil, the plants get, not established, but so settled, and the roots so firmly embedded in their new situation, that with the first fine day in early spring a start to grow is at once made; whereas those who defer planting until the long cold days of the early year, and when the parching east winds tell so prominently on vegetation generally, little wonder is it that the majority of the work then accomplished reflects but little credit on the operator, and, what is a hundred times worse still, unnecessary outlay on the owner as well. To the very fact of injudicious planting in its many forms

* *The Fertilisation of Flowers*. By Prof. Hermann Muller. Translated and edited by D'Arcy W. Thompson, B.A. (London: Macmillan, 1883.)

and with its attending dire results may be traced much of the ever-increasing unwillingness on the part of not a few landed proprietors to engage largely in the formation of new plantations, for with owners as their servants "once bitten, twice shy."

WHAT TO PLANT.

This, again, depends so much on the taste of the operator that it is no easy task to recommend even a few trees that will suit the public taste, and give at the same time a margin of profit to the owner. From rather extensive experience the following are the trees, apart from the Larch, Scotch, Silver, and Spruce Firs, that are commonly planted, that we have found to be well suited for planting in this country:—

THE CORSICAN PINE (PINUS LARICIO),

a tree that, amongst all the forms of *Coniferae* yet introduced, is by far the most desirable, whether considered in an ornamental sense, or for the value of the timber it produces. Actual experience has certainly convinced us that this is one of the trees of the future in Britain, and now that the Larch has failed completely in several parts of the country, the best substitute in our opinion is the tree in question. The timber produced in this country is excellent; the tree is in hardness and suitability for exposed or maritime situations excelled by no other; while as an ornamental tree it can well hold its own amongst the score and more of its tribe than have been introduced. As to soil it is not particular, but that of a light sandy nature is preferred; while as regards exposure, it seems to me that the higher it has been planted on the Welsh hills the better it succeeds. Grant we must that the *Laricio* is difficult to transplant safely, but this, by previous forethought and common-sense management, may be readily enough rectified. The secret, if secret there be, is this—transplant when a year old, and annually for three years before final planting-out, and losses will soon be few indeed in the transferring of this valuable Pine from one situation to another.

PINUS AUSTRILIACA AND P. STROBUS,

the latter in particular, we can confidently recommend for rather extensive use in the formation of British woods and forests. *P. strobus* grows best on decayed vegetable refuse and at average high elevations, but particularly where the subsoil rests on no great depth on rock. It produces excellent timber for inside uses; in Canada it is considered the most valuable, grows rapidly, transplants well, and is highly ornamental. I have seen it towering 90 feet in height and with a butt girth of fully 9 feet amongst the Welsh rocks, not half-a-dozen miles from Snowdon. The Austrian Pine is to be recommended as a shelter-giving tree, but hardly as a valuable timber producer, although a trial we made with it for embanking purposes, for which it is said to be specially adapted, has given the utmost satisfaction.

Almost any soil suits the Austrian well, but it is too much inclined to throw the weight of its growth into numerous and mighty branches, and less so into the stem. For planting along the outskirts of exposed maritime woods, it is of great value, and being of such a dark sombre green, it offers a fine contrast to the ordinary run of our forest trees. It transplants well, but is liable to the attacks of game.

PINUS PONDEROSA

is another valuable tree, and one that unfortunately does not in this country meet with the welcome that its merits demand; which may likewise, though in a less degree, perhaps, be said of *P. insignis*—one of the handsomest and most valuable for particular situations of any other with which I am acquainted—"For poor soils and windswept districts it is a blessing to have such a Pine" are expressions that any one may occasionally hear from the inhabitants of that desolate-looking sea-shore in Anglesey, near to Bodorgan. There it thrives with a luxuriance that is quite surprising, and puts on its freshest and greenest of tints even in the very teeth of the blast. Let every landowner who possesses a barren tract of sandy seashore at once set about reclaiming it by the judicious planting of the Pine in question, assisted by the well-tried *P. pinaster* and the common *Sycamore*; and if their efforts do not prove a success, as likewise a blessing to the landward inhabitants of such a place, I will be responsible for all blame; but mind that you plant properly and at the right time.

THE DOUGLAS FIR (PSEUDO-TSUGA DOUGLASSII)

must not on any account be omitted from our list, for a handsomer or more valuable timber producing tree it would certainly be difficult to find. Like almost every other tree the *Douglasii* has one fault—not that it transplants badly, or thrives indifferently—it is very apt to have the leading shoots broken after overtopping those of other trees with which it is planted. A remedy I have frequently recommended, but that I do so now with a far greater amount of assurance than ever before, and that is, plant the *Douglasii* only with other trees of an equally rapid growth, such as the Silver Fir, Red-wood (*Sequoia sempervirens*), or *Thuja gigantea*; or, better still, form a plantation entirely of *Douglasii*, with perhaps a few Larches for cutting out as fencing poles at an early date.

By following out this method of rearing *Douglasii* plantations the trees being of equal growth will shelter each other, whereas when planted amongst the general run of our forest trees they are coddled up until a height of 60 feet or so is attained, when the other cease growing, and leave the frail shelter-expecting tops of the Douglas Firs to battle with the storms, but which, from being nursed and protected from their infancy upwards, they are ill adapted for doing; the result being that they usually get broken over or assume that miserable whip-like appearance that is anything but desirable in well-managed woods.

All of the *Conifers* recommended to be planted with the *Douglasii* may be relied on not only as being well suited for ordinary planting, but very valuable for the timber they produce. The Red-wood for planting in dampish valleys is a capital tree, and the timber being of large size, clean, easily worked, and suitable for a great many important purposes, renders the planting of this tree in this country, for which it is particularly well adapted, a work that should be far more eagerly pursued than it is at present. Like the *Douglasii*, it is best planted alone or with other equally rapid-growing kinds, but it is by no means apt to lose its leading shoot, even when planted in exposed situations. To see this tree as it is grown at Penrhyn in alluvial deposit and a semi-sheltered situation would do any tree-lover an amount of good—the stems of 8 or 9 feet girth rising clear and straight and almost branchless for nearly 180 feet. I would strongly urge on any person who has the chance to give this giant of the forest a fair trial, and he will not be disappointed with the results. *A. D. Webster, Penrhyn Castle.*

SELENIPEDIUM SEDENI.

THIS was a most lucky cross of Mr. Seden's. Itself a most desirable Orchid, it has become the ancestor of a race distinguished for the beauty of their flowers and the robustness of their constitution. It was, we are told, the result of a cross between *C. Schlimii* and *C. longifolium*, and, what is very interesting, whichever of the two be used as the seed-parent, the result is the same. Again, this beautiful hybrid frequently produces malformed flowers, which if they do not always add to its beauty, do so sometimes, and are often most important for the secrets they reveal. Such an instance was sent us lately by Mr. Tautz, in which the three sepals (marked s in the plan, fig. 118, p. 597) were separate, the three petals, *p*, also; the median petal, or lip, *l*, in this case, instead of being bag-shaped was flat like the side petals and of the same colour, but rather larger. The outer row of stamens was represented by the usual staminode $A \times$, the two lateral ones, $A \times$, $A \times$ not being present. All three of the inner series of stamens were present, and each had its anther a_1 , a_2 , a_3 . These stamens surrounded the style, being confluent with it at the base but free above. The style itself expanded into a large median stigmatic lobe, G_1 , while the two lateral ones, G_2 , G_3 , though smaller, were yet distinctly marked. This is one of the few instances in which we have observed the ternary character of the stigma. A section of the column below the insertion of the stamens showed only three vascular bundles, while a similar section above the stamens showed also three bundles. The flower is an illustration of "regular *peloria*," a term applied to those cases in which a flower which usually develops itself in an irregular manner as to the number, form, and proportion of its parts, for some reason or other unknown, develops itself into a regular orderly fashion. As a matter of speculation rather than of demonstrated fact, in this case, it may be said that probably the regular form was the original ancestral characteristic, from which

the irregular arrangement has been evolved in course of time, the better to adapt the flower to the surrounding conditions. If so, then these cases of regular *peloria* may be looked on as reversions to the ancestral plan of construction.

Orchid Notes and Cleanings.

CONSTRUCTION OF ORCHID HOUSES.

ONE of the most important items in Orchid culture is that of the construction of the houses for the reception of the plants. Sometimes these structures are joined together or placed side by side with a gutter running up the central space between them. Such houses are difficult to get at, and glass is frequently broken through the difficulty in passing along the gutters to repair or paint the sashes. But even this, though inconvenient and expensive, we do not consider the chief evil of such a mode of construction. We maintain that there should be a passage-way of 3 feet or more in width between the houses, so that a free circulation of air may be obtained; and then, if they are span-roofed, ventilators can be placed in the brickwork in order to secure bottom ventilation, which is required equally with that at the top to keep the plants in perfect health. We have always adopted this plan, and have found it most convenient and useful for regulating the temperature of the house. It is sometimes argued that in building two walls we incur an extra expense, but we think the first expense is the best, and we know that it is soon saved by the facility of access to each house separately, by avoiding the expense of the gutters and the inconvenience of getting at the glass for repairs. The tradesmen's bills will show which is the best and cheapest plan in the end. Those gentlemen who go to the expense of having houses built, of purchasing plants, and of keeping men to look after them, should not object to lay out a little extra money on the structures for the well-being of the plants, and as they gain experience they will be able to see the difference in the progress of their plants. Those who may think it worth while to act according to these few simple suggestions will find their reward. It is always desirable to try to avoid whatever is detrimental to the growth of the plants, whatever they are valuable ones or not, for complete success not only gives one greater pleasure, but is far more satisfactory both to employer and employed. *B. S. W., in "Orchid Album."*

TWIN-FLOWERED MANILLARIA VENUSTA.

Usually when two or more flowers become fused into one, or in any way amalgamated, they assume a monstrous appearance or exhibit a greater or less depression of parts. In the present instance there is no suppression, but merely a slight dislocation of one labellum owing to the absence of space for its proper development. The spur or chin of this species is naturally very much produced or elongated, and it so happens that the labella are placed in close apposition back to back, causing the spur of one to interfere with that of the other. That which is developed naturally pushes against the long foot of the column in the other, doubling it up against the latter, which it equals in length. From the apex of this the labellum is suspended, and has its normally straight tube doubled up in a pouch fashion, containing the farinaceous material so peculiarly characteristic of this species. The lateral sepals in both cases are closely applied, edge to edge, and connate for one-half or one-third their length. The two seed vessels arise from the top of the peduncle, of equal strength or nearly so, and are more amalgamated than any other two organs of the flowers, and although by the dislocation of one labellum that appears larger, it is not really so. The specimen was handed me the other day out of curiosity. *J. F.*

DENDROBIUM PHALENOPSIS.

I notice in this week's *Gardeners' Chronicle* a short article on "*Dendrobium Phalenopsis*," which states that this plant flowers in April. This is, I think, incorrect. My plant, which is the fine variety figured in the *Orchid Album*, is, I believe, distinct in size and colour, and has always flowered in October. This was so in 1854, the first year it came over to England, and again in 1855, and it is in flower now

(1886). The plant at Kew also flowers about this time, though that variety is but little better than a large D. bigibbium. I have sent you by this post a flower which illustrates its character for size and colour, though it has been open fourteen days now. You will see that instead of being 2 to 2½ inches across this flower is 3½ inches across, and all are alike with me. D. Phaleopsis is at present very rare indeed, and I almost think that the variety I have is unique. *William Lee, Downsile.* [With this communication came a flower over 3 inches across, with broad reflected petals. The sepals were of a light rosy-lilac, the petals of deeper hue, the lip of the richest red-violet colour—truly a superb flower. We must also say a word for the packing. This consisted of damp sphagnum, as green as a lettuce—just what the Orchid cultivator should aim at. In this material the flower came to hand in excellent condition, and was readily examined. We could wish that a very heavy tax were placed on cotton wool—that most abominable of packing materials. ED.]

“REICHENBACHIA.”

The elegance and artistic character of this fine work increase with successive numbers. The value of this sumptuous publication would be increased at comparatively little cost by representations of the microscopical characters of the leaves, which, as we have occasion to show by illustrations, afford useful indications as to the amount of light or shade, and the quantity of water required by these plants. The plants figured in the present number (4) are the following:—

Masdevallia Shuttleworthii and *M. S. var. xanthocorys*, t. 13.—A very elegant plate, representing two forms not common in collections, owing to the circumstance that but few plants survive the journey from the New Granada Andes. They are not among the most showy members of the genus, but are nevertheless very pretty, the type form having a rosy tint, while in the variety xanthocorys the flowers are straw-coloured, with faint rosy streaks on the median sepal. These *Masdevallias* require a mild equable temperature and a moist atmosphere. They are best grown (says Mr. Sander) in shallow pans suspended under the roof, or placed on a shelf in a light position. If ample drainage be provided, there is no fear of giving too much water.

Zvranthus sequepedalis, t. 14.—Better known under the name of *Angrecum*.

Cattleya labiata Mendeli, *Duke of Marlborough*, t. 15.—Of this Professor Reichenbach writes:—“It is one of those grand Orchids which occupy the mind of the orchidist so fully, which fill him with such a religious admiration, that in looking at it he considers he sees the finest of all the fine Orchids.”

Zygopetalum intermedium, t. 16.—A fine old Orchid, the more useful in that it blooms in mid-winter. It requires to be grown in turfy loam, to have abundance of water, and a temperature ranging from 60° to 65° Fahr. After flowering it should be kept drier, and in a cool house.

or three years later that I paid 20s. for one bulb of King of the Blues. This and La Grandesse are, I think, the best Hyacinths of any colour. Princess Mary of Cambridge is a lovely pale blue, more beautiful than Czar Peter; Lord Derby or Blondin, King of the Reds, and King of the Yellows we are growing this year. I fancy they are the best in their respective colours. A decided advance has been made in the dark bluish-purple colour in *Souvenir de J. H. Neere*, but I fear this variety is too popular, the bulbs sent being miserably small. We are trying a dozen new varieties this year, distinct in colour, and with good trusses; these I must allude to when they come

water about in the house, as a damp atmosphere is decidedly injurious. Any shoots that seem to grow away with too much vigour should have the points pinched out; this causes the flower trusses to develop much more freely; indeed some varieties will not produce flowers at all unless the shoots are stopped when the trusses appear. *J. Douglas, Great Cornie.*

HOME CORRESPONDENCE.

Bees and Colour.—It is too late this season, but if “T. F.” next season will carefully observe bees collecting honey, he will find that my statement is materially correct. I can assure him that those knowing little insects do not waste their time in visiting “hundreds of flowers” for nought. It is true they visit some for honey and others for pollen. “T. F.” mentions “humble bees,” which I know visit many flowers that domestic bees do not, such as *Rhododendrons*, &c. My statement was, that bees (domestic bees, of course, were meant) collect their honey from one description of flower at a time, such as *Agrostis*, *Thymus*, *Heath*, *Lime*, &c., and that their exquisite sense of smell alone enables them to do so, and also to detect and prefer the most melliferous. “Dromio,” I see, confirms my observation that bees keep to one sort of flower, and even, he says, to one colour, as in the case of blue, white and yellow Crocuses. The more the habits of bees are studied, the more marvellous appears their instinct. *W. H. R.*

Grafted Grapes.—I have done a little in this way, and will now record the results. First, I put a Madresfield Court on Gros Colmar, doing this for two purposes, viz., to see if, by ordinary treatment, watering, &c., as for Gros Colmar, it would crack, and also to see if the size of the berries would be increased. It did not crack, but the berries were not so large as those on their own roots; besides, the flavour was very poor. This graft is not strong, so I have only two bunches growing with Gros Colmar. This time I have grafted Gros Colmar on *Barbrossa*, and hope for something good, as this Vine is the only stem I have that measures well in girth. The Black Hamburgh as a stock for Gros Maroc is right, one crop being enormous, and the berries large and black, with an improved flavour. Gros Maroc on its own roots is nowhere compared with the grafted Vine. Alicante worked on the Black Hamburgh stock is good for a crop of nice-shaped bunches, but I wish the berries were larger, and I am inclined to think the weight is too much for the roots, some canes of 1885 carrying 40 lb. of Grapes, but they are black and well finished. One Black Hamburgh Vine I grafted with Gros Maroc, and also Alicante; in this case the latter is much better in berry; these berries are, however, rounder than any others that I have. I have never succeeded in growing many Black Hamburghs, the fruit becoming chiefly of a red colour, and this summer it has been rather amusing to see the few bunches of red Hamburghs and black Gros Marocs on the same roots. I intend to try Mrs. Pince on Lady Downe's, as I believe the latter would prove a strong, good stock for it; and, although Mrs. Pince would not only colour any better, it might be the means of preventing the shrivelling which this variety is liable to when kept. *Stephen Castle, West Lynn, October 23.*

“T. L.” p. 502, invites expressions of experience on the result of grafting black Grapes on a white stock, and had very correspondent confined himself to the particular variety, viz., Golden Queen, I should not have added my testimony in favour of “Vitis,” who recommends that “T. L.” should graft his Vine of Golden Queen with either Black Alicante or Gros Maroc. If I cannot claim the title of an experienced Grape grower, I can, if necessary, have the corroboration of one who is, in support of excellent Black Alicante being grafted on a Vine of Buckland Sweetwater. About four years ago, owing to some changes in the arrangement of the houses, we became very short of late-keeping Grapes, and as the Grapes from the Buckland Sweetwater Vine at the end of the second house were not much appreciated, I determined to inarch this Vine with a rod of Black Alicante, which I did, taking the rod half-way up the house the first year, fruiting it and the old rod of Buckland Sweetwater the next and the following year, cutting away the old rod of the white sorts. During the whole time if there was any difference detected in the quality and finish of the Grapes, the black ones were the better of the two. I had retained a spur of the white below the union of the Alicante, and which has fruited every year since, and this last summer I cut three bunches of Buckland Sweetwater from a little extension of this spur which won me second honours in an open competition of five or six exhibitors for any other variety of white Grapes, not Muscat, and these were not nearly

FIG. 117.—PELOPONNESIAN FLOWER OF SELENIPEDIUM SEDONI COLUMN FROM BENEATH AND FROM THE SIDE, ANTHER, LIP, AND STIGMA, ALL MAGNIFIED ENOUGH TO BE DRAWN. (FOR REFERENCES, SEE TEXT, P. 595.)

FIG. 118.—PLAN OF PELOPONNESIAN FLOWER OF SELENIPEDIUM (FOR REFERENCES, SEE TEXT, P. 595.)

flowered. It does not answer to trust entirely to a solitary plant with a grand spike at an exhibition. I have learned to be careful about recommending anything until it has been proved in our own garden. This of course cannot always be done, but it is safest and best where practicable.

ZONAL PELARGONIUMS.

These are oom in great beauty in our roof-heated greenhouses. We have not yet used the heat from the pipes in the roof, nor is it necessary to do so until frosty weather, when its value is seen at once. The glass and also the flowers are kept dry, as hot-water circulates most rapidly upward. One has to be careful not to overheat these pipes, for if they are too warm the flowers are injured thereby, as I found last year. We are careful at this season not to spill

Florists' Flowers.

HYACINTHS.

The last week in October or the first in November is a good time to pot the general collection, using good rich compost of an open texture—sandy loam two parts, one part decayed cow manure, one of leaf-mould, and one of sharp sand. We use for potting ordinary 6-inch pots, these being quite large enough for any of the bulbs—those that are of smaller size do better in 5-inch. It is a grave error in culture to overpot Hyacinth bulbs; the large deep pots sold as Hyacinth pots hold too much potting soil; they have also a very ungainly appearance on the greenhouse stages. I like them not. In potting the bulb, place a little sharp sand under each—the crown of the bulb should just be seen above the potting soil; and, as a finish, drop a pinch of clean sand over the crown of each. Plunge them out-of-doors in an open position exposed to the weather.

Progress is being made in the raising of new seedling forms, but it is not rapid. When I first exhibited Hyacinths, about twenty years ago, King of the Blues and La Grandesse were not to be bought; it was two

so good for a white sort as were the Alicante for black ones, some of which are still on the Vines. For shape of bunch, size of berry, and perfect bloom and finish, nothing more could be wished for, and this Mr. Ward, at Longford Castle Gardens, I am sure, were it necessary, would confirm, as he a short time ago complimented me on my finish. I have been compelled to cut off the fruit to let in all light possible to the plants which I have underneath. For the information of "T. L.," and in support of the recommendation of "Vitis," I may be permitted to say that the Alicante on the white stock here are better than those on the Vines in another house on their own roots. *C. Warden, Clarendon Park Gardens, Salisbury.*

— *Apocryphos* of the communications of "Vitis" and Mr. Castle in the *Gardeners' Chronicle*, October 30, permit me to mention an interesting case of the mixed action and reaction of stock to action respectively that came under my notice to day at Drinkstone Park, near Bury St. Edmunds. On looking over this excellent Muscat and other Grapes grown by Mr. Palmer, Captain Powell's able gardener, a rod of Alicante—differing widely from the others by its side—was noted. The berries were equally large and well coloured, but the bunches were smaller and less wide shouldered, more like inverted pyramids than the Alicante, that were more broadly ovate in form. On inquiring into the cause of this difference, it was pointed out that this particular rod was grafted on the West's St. Peter's. This was further demonstrated, were further proof necessary, by a large bunch of the latter variety on the base of this worked Alicante. I am by no means disposed to attribute undue importance to differences of size or form of bunch in either of the two Grapes offered. They may be found in different localities, and even at times in the same house, differing widely, and more especially in form and length of bunch and breadth of shoulder. But the point in the fine house of Grapes at Drinkstone, consisting chiefly of Alicante, Lady Downe's, Madresfield Court, and Mrs. Pince, is that only the Grapes on the grafted rod differed from the other Alicante, which were of the massive broadly ovate form. Neither must any one confound the West's St. Peter's here with the Black St. Peter's—a totally different Grape, and, which is, in fact, synonymous with Alicante. But we applied on the spot a most alluring remedy, that of flesh and flavour. Three not bad judges of Grapes, of whom Mr. Palmer was one, carefully tested the quality of the Grapes on this worked Vine with those unworkeed by its side. The difference was so marked as to be obvious in an instant to all three. The skin was thinner, the flesh more tender, sprightly, and sweet, suggesting West's St. Peter's blood and quality in a moment. The skin also separated more freely from the flesh than in the other. On ripeness, that were equally fine in berry and parallel in ripeness. It is somewhat difficult to assess relative proportions of qualities on the instant, but it would be safe to assert that fully a third of the qualities of the West's St. Peter's were added to those of the Alicante growing on its roots. Nor did this change of quality exhaust the whole effect of the union of these two varieties; for on tasting the one bunch of West's St. Peter's on the base of the worked Alicante, ample proof was found on its surface of the less common effects of the scion on the stock. The skin was thicker, tougher, and the flesh less tender and juicy than in West's St. Peter's of normal quality. Though the modification of quality in this case, was less pronounced than in the Alicante on the scion, yet it was so marked as to be obvious at once to the taste. Fortunately the difference between the rinds and flesh of these two Grapes is so great as to render their closer proximity to each other through grafting the more easily apparent, and there can be no manner of doubt of the changes of form or size of bunch and quality of flesh in this case. The rebounding effect of the scion on the stock, to use a popular phrase for a mysterious physiological phenomenon, is only what might be expected from the interesting records that have been chronicled from time to time of the appearance of variegated shoots on the stems of green plants far below the point of insertion of variegated buds. *D. T. F.*

Rhus radicans (syn. *Ampelopsis japonica*) in Nurseries.—Having read the interesting article on the above plant in its poisonous effects, I can from my own experience fully endorse all that Miss Owen has said respecting it. We have a plant growing on a shed with south-west aspect in Mr. Cripps' nursery, which has been for some time a pleasing and striking object in the distance, with its bright orange-scarlet coloured foliage, which is found very useful for church and indoor decorations, and from which I cut a number of branches for the purpose of propagation two years ago. My assistant was the same day affected with a headache, and the next day had his face and arms very much swollen, and was under medical treatment for some four weeks. Last year another assistant was slightly affected with swollen

arms, &c., from the same cause. Upon me it has never shown any evil effect, although I have cut a great many cuttings on several occasions. *David Dornall.* [This is an instance of faulty nomenclature which may produce serious results. In some nurseries we could name, we have pointed out the error but without result. Ed.]

Flowers out of Season.—Among the marvels of this wonderful age not one of the least is October Laburnums. Comments have been made thereon late in the *Daily News*, &c. From Cambridgeshire and Bermondsey this prodigy has been noted. It is more marvellous that on the ridge of the Cotswold Hills, in a parish nearly 600 feet above sea level, Laburnum should still be in blossom. I have in my garden a young Laburnum tree planted last autumn, with blossoms hanging side by side with the last summer's seed-pods; and an old Laburnum tree, forming an archway over a cottage garden gate hard by, presents the same appearance. The old legend of a death happening in the family when flower and fruit hang side by side may be superstitious (though verified to my knowledge in 1864 by a Pear tree in Wiltshire), but the fact is curious. I have also in my garden now (October 27) a Strawberry plant in blossom, and a fine Strawberry quite red and well-nigh ripe for eating. These are strange marvels of the autumn of 1886. Will some one wise in the life of trees and plants give some scientific reason for these October Laburnums blossoming, and fruit-bearing plants, &c.? Is it merely the result of mildness of season? Is it only a marvellous freak of Nature? Is it the world is getting turned topsy-turvy? Is it the classical "Monstrum in forme ingenis cui lumen ademptum"? Whatever it is will these same trees and plants blossom again and bring forth fruit in their season next spring? This is an interesting present enquiry and future outlook. *Arthur Elmfield, Beverton Rectory, near Tisbury.* [In the case of the Laburnum the new flowers are produced, as in a Rose, on the new shoots of the year, instead of on "spurs." In other cases second flowering is merely an anticipation of spring. Ed.]

Lespedeza striata.—It is a mistake to say that *Lespedeza striata* is indigenous to most parts of North America. It is a Chinese and Japanese plant, which came to the United States nobody knows how, but not many years ago, but now spread wonderfully in the Southern United States. *A. G.*

Bouvardias Turned Out.—I do not mean by this that they are turned out during the summer months only, but during their flowering season from the time they are lifted from the open ground and transferred into heated pits. Having adopted the practice for several seasons with every success for the supply of cut bloom, we can recommend it with confidence. Our usual way is to lift them with a good ball and transfer them to the open ground in a pit that has previously been used for Melons; the soil used for the latter will do for the former with alterations in height, &c., so as to suit the incoming plants; about 6 inches from the glass at the time of planting will allow sufficient space for growth and flower. A thorough good watering to settle the soil after the planting is finished will be needed, then with occasional springing for a few days, and not much air, the plants will soon take kindly to their new quarters. When fairly established more air should be given; this will prevent the plants from becoming drawn, and at the same time will aid in the production of flowers of better substance and more lasting properties when cut. A little heat at all times in the pipes will dispel superfluous moisture and maintain a growing atmosphere. After Christmas, or as soon as the plants have ceased to give a good return, they will be lifted again, the b. s. reduced, and the growths pruned back, and most of them potted up to be ready for sale. The young shoots afterwards made in a moderate heat, will yield excellent cuttings; if needed to maintain the stock at the required standard. If not so needed the shoots should be pinched occasionally, and nice bushy plants will be the result; these with care in hardening off can be turned out early in June. All that is then needed to ensure success is immunity from insects, occasional watering as needed, and frequent pinching of the shoots up to the end of August, and they will retain in flowers from the pits during the following October, November, and December, after which early forced flowers from other sources will be a welcome change. *J. Hudson.*

Hybridised Daffodil Seeds.—One of our nurserymen has been advertising for sale "Surplus supplies of hybridised Daffodil seed," and on p. 535 of the *Gardeners' Chronicle* speaks of it as "the seed offered by me, I believe, for the first time in England," adding that he has tried to effect this (hybridising) with the brush aided by bees; also, that the young results will be lost to science. Brushes and bees would indeed be valuable friends to a gardener, if

they would justify him in selling all the Daffodil seed ripened in his garden at a high price. Crossing Daffodils is an art in which some of us have long been making experiments, but few of us would venture to feel sure that a cross had been effected because seed ripened on a flower which had been brushed with a hair pencil containing the pollen of another flower; still less to promise the particular cross which had been effected in this way "aided by the bees." If the raiser will wait, and most of us are content to do, till his supposed hybrids flower before announcing them, there is little fear they will be lost to science. As regards the scientific aspect of the subject, it is certain that under favourable conditions several distinct species of Narcissus may either spontaneously or artificially be crossed with one another. Many such hybrids have been found wild, and they are still more likely to be produced in gardens. For example, *N. Pseudonarcissus*, wherever it is found at elevations sufficient to retard its flowering till the season of *N. poeticus*, so that the two are in flower in the same place simultaneously, makes crosses with it, and the flowers of these hybrids vary one with another in form. In the Pyrenees, however, where I have collected them in spots where these two species have flowered together probably for many centuries, the proportion of hybrids to the normal flowers of the species is not more than one in a thousand; and we may fairly infer that this represents the proportion of hybridised seed. Crosses have been found also amongst *N. Bulbocodium*, *N. triandrus*, and some others, though less frequent, perhaps because the ground where they flower together has been less carefully searched. But Mr. A. Tait has found several such hybrids in Portugal, some of which are preserved, I believe, in the herbarium of the University of Coimbra; others flowered in my garden last spring, and are likely to flower there again. We may therefore hope for new crosses from the gardens which are cultivated at Narcissus are grown together. *C. Wally Doll, Edge Hall, Malpas, Oct. 23.*

A New Plant-protecting Material.—Just a word in corroboration of Mr. Budd's remarks respecting Messrs. B. Eddy & Co.'s dressed canvas. Like your correspondent we had a length made to cover a range of pits in which we forced such plants as Azaleas, Deutzias, Spiræas, and Lily of the Valley in the winter months, and which it was necessary to keep warm. The dressed canvas was nailed on to two strips of boards on which it was rolled off and every morning and evening the whole of last winter, and was also used for covering the earliest batch of Melons, and I must add it has answered my every expectation. It carries off all water, and is impervious even to snow, which thaws and runs off leaving the canvas comparatively dry, and presenting a striking contrast to the saturated and heavy mats which we used to remove after a stormy night. I have this day brought me a strip of dressed canvas for use again, and it looks none the worse for six months' wear. *C. Warden.*

Fuchsia corymbiflora.—As this *Fuchsia* is just now receiving some attention, permit me to state that a coloured illustration of it appears in the *Floricultural Cabinet* for January, 1841, and it is stated there—that is probably not generally known—that it was raised from seed by the late John Standish, then of Bagshot. The seeds from which it was raised were sent to Mr. Standish by a friend residing at Montreal, who had received them from Casco in Peru. It is reported to have been found growing "in shady situations in the woods at Chicaco and at Manacora, which are situated north-east of Lima, where the climate is much more temperate than in the neighbourhood of Mexico, from whence we had *F. fulgens*, and consequently, we have no doubt will be found to be more hardy than that species." I incline to the opinion that this expectation was scarcely verified. I occasionally met with *F. corymbiflora* in getting about the country, but it is not grown nearly so much as it deserves to be. *R. D.*

Anthraxite Coal.—There having been, concerning this coal, so many inquiries in the different gardening papers, and as the efficient heating power of the fuel does not seem to be generally known, I think a few remarks from one who has regularly used it for more than twelve years may be useful as an inducement to other gardeners to give it a trial. I feel certain that they would not care to revert to the use of coke after fairly testing anthracite. I know I should be very sorry to do so. It is applicable to all kinds of boilers, but appears to me to be the most suitable upright form. The largest boiler we have in use here is an Excelsior boiler, with about 2000 feet of 3 and 4-inch piping attached (half of each). This boiler consumes, in very severe weather, nearly a ton per week, but half a ton is about the weekly average during the colder six months of the year. We never do anything to the fire between 5 o'clock in the afternoon and 7 o'clock next morning, let the weather be ever so severe, as it is not required; and even at that

time but very seldom, for the pipes will be nearly or quite as hot as when left for the night. Anthracite clinkers but very little—not a quarter so much as coke; or half the stoking is wanted, but it requires a little management. If the fire is well clinkered in the morning and again at midday, to pass all the fine ash through the bars, it requires no more attention from the stoker, except to put a sufficient supply of coal in the furnace. The fire should never be stirred, or the result will be disappointing, as its heating power is greatest when left undisturbed. If by any chance our supply of the coal happens to run out, and we have to send for a few chaldrons of coke, then is the time we appreciate the good qualities of the anthracite, for it is no joke to be groping about half the night putting a few shovelfuls of coke on the bres, which I, as many more of my brother gardeners, have had to do many times. We, in general, have a little reserve of Welsh coal, as used for top drying, somewhere about the estate, and that is a far better substitute than coke—at least, we find it so. I may mention that we get just as good results with the same kind of fuel from a smaller boiler which we have in use. I do not think Mr. Rust has said one word too much in favour of anthracite, and feel convinced the longer his experience with it the better he will like it; and I am quite sure the young gardeners who have to play the stoker's part will welcome it, a little regulation of the damper being all that is required in the evening when going their rounds. We get our coal direct from the Welsh collieries in truckloads; there need be no difficulty in obtaining the genuine article. *A. Giffins, Barkham House, East Hoochley, Sussex.*

A Singular Delusion.—In reading in the *Independent* the Bishop of Winchester's address on the recent consecration of the new part of Southampton Cemetery to use the Bishop's own words, "One of the things many found it difficult to believe in these days" is, that any educated person—as a Bishop, for instance, is presumed to be—can publicly assert as a fact long since exploded, "that seeds buried with Egyptian mummies for not less than 3000 years have risen to life again;" when no instance of the kind has ever been proved from indubitable authority to have taken place. Another erroneous statement of the Bishop's was, that "seed buried in the ground died, and continued, as it were, dead for the time." That is not so. Of course seed, if bad, rots, but when good it retains the vital principle—life, and in due time germinates and brings forth fruit. Instead of seed being said to die when it is sown, the most beautiful and wonderful arrangement of Nature concerning seed is that it consists of three principal parts—the testa, the albumen, and the embryo. The testa is the outside or covering, the albumen is situated between the testa and the embryo, and supports the latter until it can develop organs to draw nourishment from external sources. The embryo is the rudiment of the future plant, which again consists of three parts, the radicle, the plumule, and the cotyledons. *A.* [We think that, as far as the matter of seed is concerned, the Bishop is in error, but the remainder of the statement is substantially correct, for the seed coat and the perisperm do die as the embryo they enclose develops itself, the embryo indeed feeds on the albumen. Ed.]

The Tillandsia (Vriesia) Regina.—At The Hollies, Dinglehouses, Wexham, the residence of Mr. Alderman Close, there is to be seen in bloom a plant of one of the finest species of the natural order to which the Pine-apple belongs—viz., the *Tillandsia (Vriesia) Regina*. This particularly species is peculiar to tropical America, and rarely flowers in this country. Mr. Slater, gardener at The Hollies, is to be congratulated on having succeeded in blooming this rare and beautiful plant, which we understand has been in Mr. Close's possession for many years. *W. W. Hargrave.*

A Large Leek.—A monster Leek has been grown in Messrs. Dobbie & Co.'s nursery gardens, Rothsay, Dumfries. The blanched part measured about 12 inches long and 9 inches in circumference. One of the outside leaves stripped off and laid out flat, measured no less than 15 inches in breadth and about 3 feet in length. The variety is Dobbie's Champion, which has carried off first prizes at several International Exhibitions since 1873. *The Buteman, Oct. 30.*

Cornish Moorlands.—Truth first and effect afterwards. The anonymous writer of the pleasant little article under the above title in your last number has, through ignorance or from a wish to heighten effect, committed an extraordinary entomological error. He associates the Purple Emperor Butterfly with flowers of Hemp Agrimony, ripe Blackberries, &c. What can be more absurd! Most certainly not the Purple Emperor. Fine Purple Emperor butterflies were seen in the month of September or October, are enough to take away the breath of any sober-minded entomologist. May I modestly suggest that he intended to write Painted Ladies, and that his wicked pen wrote something else? *R. McLachlan,*

Reports of Societies.

NATIONAL CHRYSANTHEMUM :

October 27.

A FULLY attended meeting of the Floral Committee of the above Society took place at the Royal Aquarium, Westminster, on the above date. E. Sanderson, Esq., President, in the chair, and a goodly number of subjects were staged. First-class Certificates of Merit were awarded to Messrs. James Veitch & Sons, Royal Exotic Nurseries, Chelsea; and to Mr. J. Martin, gr. to C. N. Kidd, Esq., West Hill House, Durdard, for Japanese Chrysanthemum *Phebus*, a rich pale golden variety, slightly reflexed, distinct, and a good acquisition. To Mr. Martin, to Mr. Shoemith, Hythe, and to Messrs. Henry Cannell & Sons, nurserymen, Swanley, for Japanese *La Triomphante*, in the way of Dr. Macray, bluish ground shaded with light pinkish lilac—large, full and striking. To Messrs. Henry Cannell & Sons, for pompon *Fiambeau* Toulousaine, a charming well formed bright lilac-pink variety, pleasing and distinct. To Mr. William Owen, nurseryman, Maidenhead, for pompon *William Beally*, bluish, a very charming reflexed pompon, compact, excellent form, and apparently very free; also to Mr. N. Davis, nurseryman, Camberwell, for the same. To Messrs. James Veitch & Sons, for Buttercup, rich gold, recognised as a reflexed variety, said to be one of Mr. Alfred Salter's seedlings. To Mr. George Stevens, nurseryman, Putney, for Japanese *William Stevens*, bright bronzy orange, showy and pleasing—large full flowers. To Messrs. Henry Cannell & Sons, for large *Anemone-flowered Cincinnati*, the guard petals deep lilac-pink, buff and yellow quilled centre—a very fine and distinct variety; also for *Begonia Octava*, double white, with pure *Gardenia*-like flowers of fine form—very free and pleasing.

Mr. J. Wright, Temple Gardens, had Japanese *Gorgeous*, in the way of Peter the Great, but considered to be of a brighter gold colour. Messrs. James Veitch & Sons set up a fine stand of Japanese varieties, including Japanese Ornaments, bright cerise-red, rather small as shown; *Charlotte de Moat Cabrier*, delicate bluish-pink, in the way of James Salter, the petals not so much twisted; *Irene (Salter)* a refined Japanese in the way of Maiden's Blush, very pleasing, and promising to be seen again; *M. Wick* fls. shaded chestnut-red, with slight tips of gold, one flower only exhibited, a very promising variety; *Janira*, in the way of *La Ville de Toulouse*, a fine variety—Comended; *Mons. H. Elliott*, pale cinosmon, promising.

Mr. N. Davis exhibited blooms of what he considered to be *Temple of Solomon*, a rich golden flower of the *Christiæ* type, when fully developed being partly incurved and partly reflexed; this was Comended, but it was considered doubtful if it really was *Temple of Solomon*. Mr. Davis also had pompon *Lilacé*, bright purple, lilac-exterior, and bronzy centre, very free and pleasing; Comended. Mr. Henry Galton, Shareford House, Winchester, sent a bloom of his pretty bluish sport *Bouquet Fait*, which he has named *Marie Louise*, to show that it maintains its character. Mr. W. Owen had Japanese *E. G. Henderson*, a pleasing pale yellow variety; and a bunch of his new hybrid *Marguerite*, Claret of Gold, which the committee wish to see again. Messrs. H. Cannell & Sons showed an excellent collection of bunches of Japanese and pompon *Chrysanthemums*; and *Precoité*, a pretty and compact bright chestnut-red variety, was Comended; and the same award was made to Mr. Davis and Mr. H. J. Jones, Hope Nursery, Lewisham. Messrs. Cannell & Sons also had Japanese *J. H. Laing*, delicate bluish, with purple orange and gold centre, small, but very pleasing; *Madame Rozin*, pale reddish cinnamon, the reverse gold—flat as shown, yet a promising flower; and pompon *Crémé*, bluish, with golden centre—Comended.

The next meeting of the committee is to be held on Nov. 24.

EALING, ACTON, and HANWELL :

Nov. 2 and 3.

HELD in the spacious Lyric Hall, Ealing, on the above dates, this pleasant suburban show was probably the first of the autumn series which are now so plentiful throughout the kingdom.

PLANTS.

These were shown diversely, the most striking being the large groups of *Chrysanthemums* arranged for effect, the best of which came from Mr. Wigmore, gr. to P. Hicks, Esq., Ealing, whose plants carried many fine flowers, and were all the more meritorious because so early. Other fine groups came from Mr. Baird, gr. to C. A. Daw, Esq., Ealing, who was placed 2d; and Mr. Fulford, gr. to J. Boosey, Esq., Acton, who came 3d.

Mr. Wright, gr. to — Greenfield, Esq., Hanwell, had the best three trained plants of incurved *Chrysanthemums* in Queen of England, G. Glenny, and Mrs. Dixon, fairly good; Mr. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill, being 2d, with fair specimens of *Abé Paspalla*, *Empress of India*, and *White Venus*.

Mr. Wright had three dwarf bushy pompons in *Celo Nelli*, St. Michael, and *Sir Justice*; Mr. Chadwick being 2d, with taller specimens of *Sœur Melanie*, *Fremy*, and Mrs. Astie. With a single specimen of incurved Mr. Wright was 1st with a good Mrs. Dixon; Mr. Chadwick coming 2d, with Peter the Great.

In the same class, for pompons, Mr. Fulford took 1st place with a large bush of *Sœur Melanie*; Mr. Wright came next, with a good golden *Molle*. *Marthe*.

The finest specimen Japanese, a capially bloomed broad bush of *Ilver Fleur*, came from Mr. Wright.

Of miscellaneous groups of plants was a fine and most effectively arranged bench of Ferns from Mr. Fountain, gr. to Miss Wood, Hanger Hill; a really beautiful collection of decorative plants from Gunnersbury Park, sent by Mr. Roberts, and comprising *Chrysanthemums*, *Azaleas*, *Tree Carnations*, *Heaths*, *Calanthes*, *Cypripediums*, *Scabious*, &c., with many other plants; Ferns, and other foliage plants. This collection occupied a prominent place on the raised platform. An effective group of decorative plants came from Mr. Passy, gr. to T. Nye, Esq., Ealing; and from Mr. Rideau came a good plant of *Chrysanthemum Maximum* in bloom, and a box of charmingly coloured *Primroses* in good bloom.

CUT FLOWERS.

These made a good display, and although not fully developed, yet many were exceptionally good for the early state of the show. The Japanese *Ilver Fleur* being the strongest force, the best stand of twelve coming from Mr. E. Long, gr. to E. Ridge, Esq., a new exhibitor, who had capital *Elaine*, the premier bloom of the section in the show; *Comte de Germiny*, P. Delau, *Ilver Fleur*, *Meg Merrilies*, M. Astorg, and *Madame Andiguer*, all excellent in the stand. Next came Mr. Stanton, gr. to H. Smith, Esq., Chiswick, with *Madame de Sévin*, *Madame Feral*, *Boule d'Or*, *Triomphe du Nord*, &c. With six bunches of Japanese, Mr. Hudson, gr. to H. J. Atkinson, Esq., M.P., was 1st, with fine flowers, set up on tall stems, without cups or other aids; these were *Madame de Sévin*, *Triomphe du Nord*, *Incomparable*, *Fulcon*, *Elaine*, and *Madame C. Andiguer*. Mr. Milson, gr. to W. Lindell, Esq., Ealing, was 2d, his blooms being somewhat equat in the box.

Turning to incurved flowers, the best twelve blooms came from Mr. Dawson, gr. to H. G. Lake, Esq., Chiswick, who had capital blooms of *Golden Empress* and *White Empress*, Queen of England, *Alfred Salter*, *Jeanne d'Arc*, *Angelina*, *Prince Alfred*, and *Lord Wolsley*. The *Empress of India* in this stand was the premier incurved flower in the show. Mr. Long had larger but less perfect blooms; *Prince Alfred*, *Jardin des Plantes*, *Beethoven*, *Venus*, and *Faust* were amongst his best.

Mr. Milson had the best nine blooms.

Mr. Collyer had the best six blooms, having fine *Lord Wolsley*, *John Salter*, and *Queen of England*.

Pompon flowers made a fine show, being well out and remarkably good. In the class for twelve bunches, Mr. Milson was 1st.

In a class for twelve trebles, the blooms being very fine, Mr. Collyer was 1st, having fine flowers of *Prince of Orange*, *La Patrasse*, *Madame Maré*, *St. Rias*, *Miss Winceler*; Mr. Passy came 2d with capital blooms of *Toussaint Laurinet*, *St. Rias*, Mr. Holmes, *Rose d'Amour*, *Fremy*, &c.

Mr. R. Dean was the only exhibitor of six pompons, having very good flowers.

Only two bouquets were shown, the best, white ground, dressed with bronzy-red and crimson flowers, and *Maidenhead Ferns*, came from Mr. Baird—Mr. Chadwick having the other, composed entirely of white flowers.

Of other flowers, Mr. Hudson had a big box of twelve varieties, and was 1st in the class for six bunches, with *Stephanotis*, *Dipladenia amabilis*, *Lapageria rosea* and *L. alba*, *Vanda tricolor*, and *Pasiflora quadrangularis*. Mr. Baird, who came 2d, had some beautiful white *Camelias* in his lot. Mrs. H. B. Smith, Ealing, had a new style of basket with an elevated base, termed *The Gleaner*, most effectively dressed with *Bramble leaves* and yellow, buff, bronze, and red *Chrysanthemums*, to be in character with the foliage, also some elegant spray of *Saffron rosetoods* and *Pleione flowers*. A curious contribution was a box of bright single *Dahlia* blooms, sent by Mr. Fountain.

FRUIT.

The best Grapes came from Gunnersbury House Gardens in Mr. Hudson's usual fine form, the three bunches shown comprising two fine *Black Alicante* and one of *Alnwick Seedling*. Mr. Baird came next

with two good Alicantes and one of Bowwood Muscat, and Mr. Milson was 3d, with fine berried Lady Downes.

Pears were excellent, the best three dishes coming from Mr. Garlandroy, gr. to C. B. Bingley, Esq., Greenford, who had good Beurc' Dieul, Van Mons, and Pittmaston Duchess. Mr. Milson was 2d, with excellent Beurc' Bachelier, Beurc' Dieul, and Pittmaston Duchess.

Of dessert Apples, Mr. Hudson had the best in handsome Gravenstein, Scarlet Nonpareil, and Ribston Pippin; J. Mr. Wright was 2d, and Mr. Chadwick 3d, with Kitchen Apples—all capital samples.

Mr. Chadwick was 1st with good Wellington, Emperor Alexander, and Minchul Crab; Mr. Hudson had Blenheim Pippin, Pomona, and Golden Noble.

Mr. Hudson sent a collection of sixteen dishes of Apples and Pears. Mr. Garlandroy put up a collection of forty dishes, and from Messrs. C. Lee & Sons came a collection of five samples of Apples—in all sixty dishes, such as Warner's King, Beauty of Kent, Pomona, Stirling Castle, Lord Derby, Mere de Ménage, and others being remarkably good.

VEGETABLES.

The best collections of these came from Messrs. Fountain, Nilson, and Simmons, Ealing—all good samples.

For Messrs. Sutton & Sons' prizes for four dishes of Potatoes, there were seventeen competitors, the samples from Charles Taxgood, Mr. Chadwick, J. Farndon, and others, were exceptionally good. London Hero, Schoolmaster, Snowdrop, Vicar of Laleham, Beauty of Hebron, and Duke of Albany, were specially noted.

In the cottagers' classes there was large competition, their exhibits in Carrots, Parsnips, Onions, Celery, &c., being specially noticeable.

There were some twenty-six dishes shown in the two classes for boiled Potatoes, and generally the cooking and quality were first-rate, some ten dishes receiving awards.

HIGHHATE, FINCHLEY, AND HORNSEY CHRYSANTHEMUM: Nov. 3 and 4.

GROUPS OF PLANTS IN POTS.—At this show were several very fine lots of Chrysanthemums, especially in the cut blooms, some of the collections being highly creditable. The show was rather large, although in many classes there were not as many competitors as prizes offered.

The best group in competition for prizes offered by the President of the Society was that of Mr. James Brooks, gr. to W. Reynolds, Esq., The Grove, Highgate. This was an extensive group, and included several very fine plants, and was composed of about equal quantities of Japanese and incurved. The arrangement was tasteful, and the colours well blended. Mr. J. H. Witty, gr. to The London Cemetery Company, Highgate, was 2d, also with a large group of good quality.

Mr. W. Theobald, gr. to A. Goslett, Esq., J.P., had the best six trained Japanese plants. They were good plants, elegantly trained, and very even.

For prizes offered for six trained plants (pompon), Mr. J. Brooks was awarded the 1st prize; the flowers were rich coloured, and plants well grown.

Three white-flowered varieties were exhibited by Mr. J. Brooks, who obtained 1st for good plants, Fair Maid of Guernsey, and Lady Selborne being very good.

The best single specimen plant was Chinaman (a Japanese), from Mr. J. Brooks. This was a very fine plant. Mr. W. Theobald was 2d; and 3d, Mr. E. Calvert, gr. to G. Kent, Esq., Highgate, for L'He des Plaisirs. The competition here was very good.

The best six incurved plants also came from Mr. Brooks, his Mrs. Dixon (yellow incurved), Princess of Wales (incurved bush) being very fine. Mr. Theobald was a good 2d.

CUT BLOOMS.

Bouquets were fairly well represented, the premier award being granted to Mr. F. Horsman, gr. to A. J. Reynolds, Esq., Highgate, for a light arrangement. Mr. W. Theobald received 2d for better flowers, but not so lightly set up. Table decorations were also good.

Twelve cut reflexed blooms.—1st, Mr. W. Theobald, with as his best Dr. Sharp, King of the Crimsons, and Emperor of China.

For twenty-four cut blooms Mr. W. Theobald was 1st, with good blooms of Elaine, Refulgens, La France, &c.; 2d, Mr. J. Brooks, with Maid of Guernsey and Madame Clemence Audigier, &c.

Mr. Brooks was 1st for twenty-four Japanese blooms with Madame C. Audigier, Fair Maid of Guernsey, Elaine, &c.; 2d, Mr. W. Theobald, with Carmen, Peter the Great, &c.; 3d, Mr. J. Brittain, gr. to F. Reckitt, Esq., J.P., Highgate. In this and in the former class the stands were of excellent quality.

For twelve large Anemone-flowered the 1st prize was given to Mr. Theobald, for a good stand, including Prince of Anemones and Fleur de Marie.

For twelve cut blooms (not pompons) Mr. Theobald was again 1st, and Mr. T. Curyer, gr. to A. G. Meissner, Esq., Hornsey Lane, 2d. The best flowers from both groups were Criterion, Comte de Germiny, and Source d'Or. Mr. J. Hatt, gr. to T. Redpath, Esq., Hornsey, was a close 3d in a good competition.

For six blooms of one Japanese variety, Mr. Theobald was again the chief prizeman.

For six blooms of Empress of India Mr. B. Calvert was 1st with good blooms.

Mr. T. Turk, gr. to T. Boney Esq., Highgate, had the best six incurved blooms (one variety), and Mr. B. Calvert 2d. All the above were special prizes. There were others, but the competition being poor, we do not regard them as worth mention.

OPEN CLASSES.

Mr. B. Calvert had the best stands of thirty-six, the finest being Elaine, Bouquet Fait, Margot, Queen of England, Lady Slade, Lord Alcester, &c.—very fine; 2d, Mr. Brittain, with good flowers, especially Japanese, including grandiflora, Jeanne d'Arc, Source d'Or, &c.

In all the leading classes Mr. Brittain, Mr. Theobald, Mr. Brooks, and Mr. B. Calvert, secured the chief prizes with such varieties as have been already mentioned.

The prizes offered in other classes, not for Chrysanthemums, which included plants and vegetables, were extensively competed for by cottagers, &c., but we are unable to give the awards that were made, for they were not published when we left. The same may be said about the Medals and Certificates of the National Chrysanthemum Society which were at the disposal of the local committee.

Messrs. B. S. Williams, Holloway, and Messrs. W. Cuthub & Sons (Limited), Highgate, staged, not for competition, one group each of foliage and flowering plants, very good.

Mr. J. Douglas staged three bunches of Grapes, Snow's Muscat, Mrs. Pince, and Royal Vineyard, which were also creditable.

SCOTLAND.

ORCHIDS AT OSWALD ROAD, EDINBURGH.—JAMES BUCHANAN, ESQ.

THIS well known collection of Orchids is always worthy a visit by any one interested in these plants. The present is not the best season to find many in bloom, yet the large number of interesting species and varieties comprised in the collection renders an inspection both instructive and delightful to the lover of Orchids at any time. The perfect health of the collection, and the many fine, almost matchless specimens of rare kinds, afford an amount of pleasure to the eye of the cultivator which it is most agreeable to record to the credit of Mr. Grossart, the gardener.

Amongst those in flower we noted a grand form of *Lælia elegans asiatica*, which was recently pronounced by Mr. B. S. Williams to be the finest he had met with. It is in the way of *L. e. Turneri*, and quite equal to that variety in the size, substance, and brilliant colour of the flowers. Mr. Williams looks upon the plant as being remarkable, as he knows of no other at the present time in cultivation of the same variety. *Cattleya Schofieldiana*, a rare and curious species, was flowering for the first time in the collection. The figure in the *Orchid Album* is a very faithful representation of the almost indescribable colouring of this very distinct species. *Lælia elegans Lowiana*, a very fine plant of this grand variety, was in bloom. *Vanda cerulea*, a remarkably deep coloured variety, was showing newly opened flowers of great size; the reticulations of the veins passed from the fine sky-blue of the ground colour into clear violet.

Amongst others in flower were a grand plant of *Vanda tricolor superba*, and a superior variety of *V. suavis* similar to Veitch's variety, *V. teres*, *Pleione Wallichiana*, *Dendrobium Dearei*, *Oncidium sarcodei*, the latter opening splendid spikes from 5 to 6 feet long; *Cypripedium Spicerianum* was plentiful, and imparted a pleasing feature to the stages on which it was displayed. *Odontoglossum* were not plentiful in bloom, but a very superior *O. grande* challenged attention; the flowers were very large, about 7 inches across from tip to tip of the lateral petals, which were proportionately broad, and the colouring was very deep and well defined. Other excellent varieties of this species were in bloom also,

but none that could be compared to the one described. In a very full collection of very healthy *Masdevallias* we observed only *M. chimæra* and *M. bella* in bloom, along with the very distinct and rare *M. macroura*.

Of rare and unique sorts not in bloom we noted a magnificent specimen of *Lælia purpurata alba*, 4 feet through, showing thirteen grand growths just maturing; *Cattleya crispa superba*, 4 feet through, with twelve strong growths; *Cymbidium eburneum* and *C. e. Dayanum*, both very fine plants, the latter 3 feet in diameter; *Cypripedium Stonei*, also about 3 feet through, a splendid mass that it would be difficult to match; this plant formerly held a place in the renowned collection of the late Mr. Sam Mendel; *Cattleya crispa Buchanani*, a valuable and distinct form of this species that originated in this collection, and was named after its owner. *Nanodes Meduse*, of this a remarkable plant of about 18 to 20 inches across, with very numerous growths, was very notable; *Ada aurantiaca*, a very luxuriant plant, with from thirty to forty growths; *Odontoglossum vexillarium rubellum superbum*, a fine plant, and believed to be one of three only of this form known to be in this country at the present time. The plant was bought from Messrs. Ireland & Thomson a short time ago for *O. v. rubellum*, but on flowering it was found to be the true superbum form, of which the only other two verified plants are in the possession of Sir Trevor Lawrence and Mr. Measures respectively. *Odontoglossum brevifolium*, which is found very shy to flower, is showing four strong spikes for the first time in this collection. It is worthy of note that this species flowers from the two-year-old or three-year-old bulbs—never from the younger ones. The closely related *O. coronatum* has the same peculiarity as regards flowering from the older bulbs, but it is less shy, and has flowered in this collection before. Two fine plants of *Lycaste Skinneri* alba, one with three gigantic bulbs, the other with ten smaller bulbs, were recently obtained from Mr. B. S. Williams among a dozen plants purchased for the typical *L. Skinneri*—a fine stroke of good fortune for Mr. Buchanan, if not for Mr. Williams! Space will not admit at present of our remarking on many other noteworthy subjects to be found in this collection, and we shall finish at present with the mention of perhaps one of the finest plants of *Cattleya exoniensis* in the country, a plant with fourteen fine plump pseudobulbs, all with healthy leaves, and consequently a rather valuable possession in itself.

The whole collection is grown in glazed pots, with the exception, of course, of such as are grown in baskets and blocks, and Mr. Grossart has a strong preference for them over the ordinary porous pots. Judging by the very healthy condition of the entire stock it would be difficult for those who look upon the glazed pots with disfavour to say there was room for improvement here, or that to revert to the use of porous ones would be desirable. A.

SEX IN PLANTS.

To American botanists mainly is due the credit of the discovery that whether a plant be male or female, or a flower on the plant be male or female, is a mere question of nutrition. The primary cell seems capable of developing an individual of either sex according to the amount of nutrition it assimilates, and this assimilation may depend on the quantity of nutrition actually at command, or the ability of the cell to profit by it. In Coniferous trees the female flowers, ultimately the cones, are only borne on branches which have plenty of light at command and are endowed with vigorous vitality. When these branches become overshadowed, or weak from age, they are given up to male flowers only. In Indian Corn and similar plants the ears are located where the most favourable conditions for nutrition exist, the male flower, or tassel, forming merely the "tail end" of the stalk. Numerous facts of this character have been collected closely connecting the female flower with full nutrition, and the male flower with a more limited supply in the primordial stages of their existence.

European observers continue to record facts sustaining these views. Among the latest is a paper by Hlofmann in the *Botanische Zeitung* for 1885. He sowed seeds of numerous kinds of dioecious plants closely together, so as to give little food to each plant, and the same plants thinly, so as to give each

plant nearly all the food it could use. Where they were thickly sowed he counted 283 males to 700 females. In the well-fed lot there were but seventy-five males. In our own country the common Rag-weed, *Ambrosia*, is a good illustration of this fact. In a Potato or corn-field where the plants grow very strong and vigorous, the proportion of female flowers is largely in excess of the male, and it is not uncommon to find plants with nothing but female flowers under these circumstances. But in fields where grain has been cut, and the Rag-weed comes up in thick masses late in the season, and nearly starving each other, male flowers are very numerous, and some are wholly male. Female flowers are always few on each plant. *Thomas Mehan.*

CAPE BULBS.

In the published papers on Cape bulbs by Mr. Baker and others, the great distinction in vegetative habit between Eastern Cape and Western Cape bulbous plants has been ignored, although in this differentiation will lie some of the cultural difficulties experienced. Thus *Lixias* are all Western, and are subjected to a wet cold winter followed by a burst of glorious spring or rather young summer, during which they flower. The Eastern Gladioli, such as *G. Eckloni*, *G. carneus*, &c., experience a perfectly dry winter and come to flower late after the rains of November, i.e., when Western Cape Gladioli have run their course. Obviously Westerns fail to grow Eastern bulbs to any perfection, and *vice versa*. Also such things as *Cliveas* and *Vallotas* keep slowly growing in the dead season, and never shed all their leaves. Yet Cape bulbs, *genus omnia*, get the same treatment from the average gardener, than whom often no more stolid follower of routine exists. *P. MacEwan, Cape Town.*

- Oct. 28.—Fine and bright.
- 29.—Slight rain in early morning; fine warm day.
- 30.—Thick mist in morning, and overcast all day.
- 31.—Slight rain in early morning; dull and overcast throughout.
- Nov. 1.—Wet till 1 P.M., fine and bright afterwards.
- 2.—Fine till noon, then a little rain, and fine and dull alternately afterwards.
- 3.—Fine till 2 P.M., wet and dull afterwards.

LONDON: Atmospheric Pressure.—During the week ending October 30, the reading of the barometer at the level of the sea increased from 30.10 inches at the beginning of the week, to 30.27 inches by 9 A.M. on the 25th, decreased to 29.88 inches by the morning of the 27th, increased to 30.38 inches by the afternoon of the 29th, and was 30.16 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.17 inches, being half an inch higher than last week, and 0.27 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 62° on the 29th; the highest

on the 27th was 49°. The mean of the seven high day temperatures was 54°.6.

The lowest in the week was 42°.6 on the 24th; the lowest on the 25th was 47°.5. The mean of the seven low night temperatures was 45°.3.

The greatest range of temperature in one day was 16° on the 29th, the smallest was 3°.5 on the 26th. The mean of the seven daily ranges was 9°.3.

The mean daily temperatures were, 48°.4 on the 24th, 49°.3 on the 25th, 47°.3 on the 26th, 46°.3 on the 27th, 50° on the 28th, 54°.1 on the 29th, and 52°.6 on the 30th. These were all above their averages with the exception of the 27th, which was 0°.6 below, by 0°.5, 1°.8, 0°.1, 3°.3, 7°.5, and 6°.1 respectively.

The mean temperature of the week was 49°.7; being 0°.6 higher than last week, and 2°.7 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 88° on the 29th. The mean of the seven readings was 67°.2.

Rain.—Rain fell on four days to the amount of 0.17-inch.

ENGLAND: Temperature.—During the week ending October 30th, the highest temperatures were 65°.4 at Cambridge, 64° at Truro, and 62° at Plymouth and Blackheath; the highest at Sunderland was 54°, and at Preston and Newcastle 56°. The general mean was 59°.

The lowest in the week were at Bradford 34°, at Hull 37°, and at Cambridge 39°; the lowest at Brighton was 46°, and at Plymouth, Sheffield, and Leeds 45°. The general mean was 42°.3.

The greatest ranges of temperature were at Cambridge 26°.4, at Bradford 22°.8, and at Hull 22°.1; the least ranges were at Sunderland 10°, at Sheffield 12°, and at Preston and Newcastle 13°. The general mean was 53°.8.

The mean of the seven high day temperatures was highest at Truro 59°.7, at Plymouth 56°.3, and at Hull 54°.9; and lowest at Sheffield 50°.6, at Bradford 51°.3, and at Wolverhampton 51°.6. The general mean was 53°.8.

The mean of the seven low night temperatures were highest at Plymouth, 49°.4, at Truro 49°, and at Brighton 48°.1; and were lowest at Cambridge, 43°.7, at Bradford 43°.8, and at Hull 44°. The general mean was 46°.

The mean daily range was greatest at Cambridge, 11°, at Hull 10°.9, and at Truro 10°.7; and least at Sheffield, 4°.4, at Sunderland 6°.3, and at Brighton 6°.5. The general mean was 6°.5.

The mean temperature was highest at Truro, 53°.5, at Plymouth 52°, and at Brighton 50°.6; and was lowest at Bradford, 46°.7, at Wolverhampton 47°.1, and at Sheffield 47°.6. The general mean was 49°.2.

Rain.—The largest falls were 0.99 inch at Truro, 0.95 inch at Newcastle, and 0.91 inch at Preston; the smallest falls were 0.07 inch at Hull, 0.12 inch at Cambridge, and 0.17 inch at Blackheath. The general mean fall was 0.51 inch.

SCOTLAND: Temperature.—During the week ending October 30th, the highest temperature was 60° at Paisley; the highest at Perth was 51°.9. The general mean was 55°.8.

The lowest temperature in the week was 32° at Perth; the lowest at Dundee was 42°.3. The general mean was 39°.4.

The mean temperature was highest at Paisley, 49°.8; and lowest at Perth, 46°. The general mean was 48°.2.

Rain.—The largest fall was 0.65 inch at Dundee; the smallest fall was 0.28 inch at Paisley. The general mean fall was 0.45 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, November 1, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W. :—The weather has been cloudy or dull generally, with several, but not heavy, falls of rain.

The temperature has been above the mean in all districts, the excess ranging from 2° in Ireland, the "Channel Islands," and the north-west of England, to 5° over north-eastern, central, and southern Eng-

land, and also in the west of Scotland. The highest of the minima, which were registered in most places on October 29, varied between 57° (in Scotland) and 65° (in "England, S.W."). The lowest of the minima which were recorded during the earlier days of the period, ranged from 29° to 33° in Scotland, from 30° to 32° in Ireland, and from 30° to 43° in England. In the "Channel Islands" the lowest reading was 47°. During the latter part of the time the minima were high for the season, the thermometer at many stations not falling as low as 50°.

Rainfall has been a little more than the mean in "England, N.W.," but rather less in all other districts.

Bright Sunshine shows a decided decrease, except in "England, S.W.," the "Channel Island," and "Ireland, S." The percentages of the possible amount of duration ranged from 9 to 15 in the "Wheat producing" districts, and from 19 to 35 in the "grazing" districts, while in "Scotland, N.," 38 per cent. was recorded, and in the "Channel Islands" 41 per cent.

Depressions observed.—During the whole of this period the barometric pressure has been highest over Sweden and the Baltic, while towards the end of the time it became relatively high over Germany and France. No depressions appeared immediately over the United Kingdom, but during the earlier part of the week a disturbance, which subsequently travelled slowly away to the north-westward, lay over the Bay of Biscay and produced fresh or strong easterly winds on all our coasts. During the latter part of the period some depressions skirted our extreme and north-west coasts, causing fresh or strong southerly and south-westerly winds in the west, and moderate breezes from the same quarters elsewhere.

Law Notes.

RATING NURSERIES.—On Saturday, October 9, Mr. Edwin Bentley Haynes, proprietor of the Penge Nurseries, was summoned at Croydon, by the overseers for the hamlet of Penge, to show cause why a distress warrant should not be issued against him for the non-payment of £39 15s. 6d., due for rates. Mr. Haynes contended that he had been overcharged, the Act of Parliament clearly stating that in nurseries, florists, farmers, and occupiers of arable land, should only be called upon to pay one-fourth of the rateable value. In this case the overseers had charged him one-fourth in respect of his land and plant-houses for the sewer and consolidated rates, but they had demanded the full amount of the poor, lighting, and police rates. He held that a nurseryman's houses were quite as necessary for him to keep his stock in as a cellar was to a publican. At Tottenham a case was fought, and the justices decided in favour of the florist. He would be glad if the Bench would state a case, as he was determined to have the opinion of the Court of Queen's Bench on the subject.

The Chairman said they could not do that. They must grant the warrant asked for by Mr. Besley.

Mr. Haynes: As the matter is to be fought out, will you kindly allow the warrant to stand over?

Mr. Besley: If you reply you can take the matter to the House of Lords.

The warrant asked for was then granted.

Mr. Besley applied for costs, but the magistrates declined to make any order, except for cost of summons, viz., 3s.

Answers to Correspondents.

TO THE TRADE.—Members of the Trade will oblige by sending notes of matters of Trade interest, Cultural or Commercial. Short notes of daily experience are what are most useful.

ADIANTUM SEEDLING: *E. H. II.* A handsome Fern, which we shall note further hereafter, but shall be glad to know if it is constant from spores, as on that depends its value. It seems to have a good deal of *Adiantum cuneatum* about it, but the fronds are larger and taller, as well as different in composition. There is not much trace of *A. amabile* in it, though it is to be presumed it is one of the forms now regarded as hybrids.

AMERICAN OAKS: *H.* These are notoriously variable and multiform. We believe that of the two you send, that with the longer and more-brilliantly coloured leaf-stalk is *Q. cocinea*; the other, with shorter and duller-coloured leaf-stalk, is *Q. rubra*.

CHRYSANTHEMUM BLOOMS: *C. H. Cook and others.* We cannot undertake to name Florists' flowers—let some good specialist see them.

CINERARIAS: A. Z. Please send a specimen of diseased plant and soil in which they grow.

CLEMATIS TO NAME: H. F. Send a flower to some specialist, as Mr. C. Nispe, Bagshot, or Messrs. J. Standish & Co., Ascot, Berks.

EGYPTIAN CORN 3000 YEARS OLD GROWING ON DENIG SOWN. CORN GROWING IN A MAN'S CHEEK: W. Rod. The first is pure fable, and is an impossibility, the vitality departing from the seed after a few years. As regards your second question, there is no doubt of fresh corn being capable of germinating in a moist part of the body where there is access of air.

EUCHARIAS: F. P. We cannot find any trace on the bulbs you send, but nevertheless we strongly suspect there are some.

FUCHSIAS: W. H. Both specimens are forms of F. magellanica, and quite distinct from the true F. coccinea, figured at Bot. Mag., t. 5740. W. R. H.

GERMINATION OF SWEET BIER SEEDS.—Layer the laws in sand until the spring, when the fleshy part will have decayed; then wash out the seed, and dry or mix with sand to prevent it sticking together if used immediately, and sow broadcast on a deeply dug piece of ground in a warm position. Cover the seed with half an inch of fine soil, and let a fresh crop of weeds by hand-picking. Some plants will appear the first and the rest in the second year.

NAMES OF FRUITS: G. H. Apple Cellini.—F. T. 3' Dumelow's Seedling; 4, Warner's King; 6, Cellini; 7, Emperor Alexander; 8, Cox's Pomona; 9, Blenheim Orange; 10, Hammond's Jersey Pippin. Others not recognised.—H. Farnell, 1, Franklin's Golden Pippin; 2, Betty George; 3, Empress of America; 4, Beurré Bosc; 5, Uvedale's St. Germain; 6, Thompson's—H. Raymond Barker, 1, Thompson's; 2, Helliote Dundas; 3, Souvenir du Congrès; 4, Glou Morceau.—Alfred O. Walker, 1, Beurré Clairgout; 2, Brown Beurré; 3, Seckle; 4, Beurré Harlay, true.—Albert Butcher, 1, Louise Bonne of Jersey.—W. C. Hutch & Son.—Apple Worcester Pearmain.—James Day. Apples: 1, Eckdindle; 2, Emperor Alexander, very pale. Rest not known.

SLUGS: R. Boniface. The slug you send is the Testacella Mangai, the slug with a shell at one end of the

INTELLIGENT READERS, DO PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this Journal, 41, Wellington Street, Coleman Street, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

Enquiries.

"He that questioneth much shall learn much"—BACON. BEES IN BAR-FRAME HIVES.—Can any of our bee-keeping correspondents inform us if bees in bar-frame hives rob bees in straw skeps of their honey, and by this means accumulate a double harvest of honey?

Markets.

MARKET quiet, with heavy supplies generally. Large arrival of St. Michael Pines to hand at lower quotations. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Grapes, etc.) and prices per unit. Includes sub-sections for 'VEGETABLES.—AVERAGE RETAIL PRICES' and 'PLANTS IN POTS.—AVERAGE WHOLESALE PRICES'.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flowers (Lilium longiflorum, Arum lilies, etc.) and their average wholesale prices.

SEEDS.

LONDON: Nov. 3.—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, E.C. state that there was scarcely any business doing on the seed market to-day, the attendance being small. The demand for winter Vetches is not active; low prices still prevail. More money is asked for French Mustard. Rape seed also is dearer. Notwithstanding this advance, both articles are extraordinarily cheap. The new American red Clover seed which has just arrived excites but little attention; very moderate rates are offered. Canary seed firmly maintains the recent advance. Hemp seed continues to tend in buyers' favour. Owing to increased inquiry, higher prices are asked for French Buckwheat. Haricot Beans and blue Peas for boiling are now well worth the money.

CORN.

MARK LANE: Nov. 1.—The trade in English Wheat was slow, but prices were firm and hardening. Transactions were quiet of retail extent in foreign W heats, but last Monday's rates were paid. The flour trade was slow, but the recent advance was fully maintained both for English and foreign. Good and fine-malting Barley was in steady request at the advance established a week since. Grinding sorts were a dull sale, but steady in value. A fairly good business was passing in malt. Egyptian Beans were rather easier for buyers. Peas were taken off with a quiet demand. Maize was the turn dealer, and Oats were firm, with a tendency against buyers, but the trade was quiet.

Nov. 3.—There was a fair attendance, and a moderate inquiry for English W heats, which realised quite previous rates. Foreign descriptions met a slow sale, but were upheld in value. Flour was firm, with a moderate demand. Making Barley sold at full prices. Grinding sorts were quiet without alteration in value. Maize was firm on light supplies. Beans and Peas met a quiet trade at Monday's prices. Oats sold at full prices, and a fair average of business was done.

Average prices of corn for the week ending October 30:—Wheat, 30s. 3d.; Barley, 27s. 7d.; Oats, 17s. 7d. For the corresponding period last year:—Wheat, 31s. 4d.; Barley, 30s. 2d.; Oats, 19s. 2d.

FRUIT AND VEGETABLES.

COLUMBIA (East London): Nov. 3.—Good supplies of all kinds of vegetables; trade brisk at fair prices. Cauliflowers, 2s. 6d. to 4s. 6d. per dozen; Carrots, 3s. 6d. to 10s. 6d.; Spinach, 1s. 6d. to 2s. 6d. per sieve; Brussels Sprouts, 1s. 3d. to 2s. per half sieve; Cauliflowers, 5s. to 10s. per tally; Cabbages, 1s. 6d. to 4s. 6d.; Greens, 1s. 3d. to 2s. per dozen bunches; Turnips, 2s. to 2s. 6d. doz.; Grading, 2s. 6d. to 3s. 6d. doz.; Onions, 3s. 6d. to 4s. per cwt.; Carrots, 2s. to 3s. per ton; Mangels, 17s. to 19s. 6d.

STRAFORD: Nov. 2.—The market has been well supplied, and a brisk trade was done at the unmentioned prices:—Cabbages, 2s. 6d. to 3s. per tally; Savoys, 3s. to 4s. doz.; Cauliflowers, 2s. to 3s. per dozen; Carrots, household, 2s. to 3s. per ton; cattle feeding, 2s. to 3s. 6d.; Parsnips, 1s. 6d. to 2s. per score; Mangels, 14s. to 17s. per ton; Onions, 80s. per ton; Apples, 5s. to 6s. per cwt.; do., King's, 7s. to 8s. per bushel; Celery, 7d. to 9d. per roll; Watercress 6d. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: Nov. 2.—Of inferior and common qualities supplies were large, and for these the market was irregular, with lower prices; but best qualities were not so plentiful, and had a tendency to harden in value. Quotations:—Kent Regents, 50s. to 100s.; Essex do., 50s. to 85s.; Early Rose, 60s. to 70s.; Magnum Bonum, 45s. to 85s.; and Hebrons, 60s. to 95s. per ton.

COLUMBIA (East London), Nov. 3.—Trade showed improvement during the past week. Quotations:—Kent Regents, 70s. to 80s.; Magnum Bonum, 50s. to 70s.; York and Lincoln Regents, 50s. to 70s.; Regents, 65s. to 75s.; Cambridgeshire Regents, 65s. to 75s. per ton.

STRAFORD, Nov. 2.—Quotations.—Best Magnums, 60s. to 70s.; do. seconds, 45s. to 60s. per ton. Imports.—The imports into London last week consisted of 34 bags from Rotterdam, 2 Hartlingen, 1417 Stettin, 809 bags 3 casks Hamburg.

HAY.

WHITECHAPEL: Nov. 2.—Supplies were large, and the trade dull at the following quotations:—Clover, prime, 83s. to 100s.; inferior, 70s. to 84s.; hay, prime, 70s. to 90s.; inferior, 30s. to 65s.; and straw, 27s. to 36s. per load.

CUMBERLAND (REGENT'S PARK): Nov. 2.—Large supplies, and a very dull trade, with prices tending in favour of buyers. Quotations:—Clover, best, 86s. to 100s.; second, 70s. to 80s.; hay, best, 75s. to 85s.; second, 50s. to 70s.; and straw, 28s. to 36s. per load.

STRAFORD: Nov. 2.—Hay, 75s. to 84s.; Clover, 90s. to 95s.; and straw, 27s. to 33s. per ton.

Government Stock.—The Stock Exchange was closed on Monday. On Tuesday and Wednesday consols were quoted, at the finish, at 101 to 101 1/2 for delivery, and 101 1/2 to 101 3/4 for the account. Thursday's closing figures were as on the previous day for delivery, and 101 1/2 to 101 3/4 for the account.

FIG. 119.—THE SHELL-BEARING SLUG.

body. It devours its finer creatures, and is not considered a gardener's enemy.

NAMES OF PLANTS: C. L. Lardizabala biterata.—R. W. The specimens you send seem to be seedlings of some species of Pinus which has not yet produced its characteristic foliage. We cannot tell to what species they belong. Eucalyptus, Tillandsia zebrina; T. tricolor var. aculeata.—G. Flemwell, Agaricus serotinus.—Redwood, A. Salvia, of which we will endeavour to give you the full name next week. We should be glad if you would send us a good specimen, properly packed in damp moss or blotting-paper in a tin box, in order that we may give a figure of it.—C. Smith, 2 and 3, Aster Nove-anglie, two varieties.—Nidus, Hibbergia Morletiana; the Iridis is a Moraea—material too incomplete to recognise species.—R. B. Lovers, 1, Anthurium aculeate; 2, we do not identify; 3, Santolina incana; 4, Geranium stratum; 5, Aster diffusus; 6, Aster macrophyllus.—G. S. The plant appears to be Gaidia imberbis, but flowers are required to decide; propagate by cuttings in very sandy loam.—C. C. Pleione Wallichiana.—F. E. 1, Laetia serrata; 2, Polypodium Catherineæ; 3, Eugenia Bouvardii, doz.; 9, 10, 11, Oncidium raniferum; 6, Dendrobium lighbloom.—J. H. 1, Nerine undulata; 2, Smilax aspera; 3, probably Jasminum Sambac; 4, Aralia sp.—J. H. H. Ulimus campestris var. gracilis.

TIME FOR POTTING PLIIONES AND CLOVEYES: J. Raymond. The best time for these Orchids, of whatever species, is just as the flowers begin to fade.

TOMATOS DISEASED: Solomon. The Tomatos are infected with a fungus described in this paper by Mr. Plowright under the name of Dactylium Lycopersici. See Gardeners' Chronicle, November 12, 1881. We know of no certain remedy. The diseased foliage, stems, &c., should be got rid of by burning. W. G. S.

VARIEGATED BLACK CURRANT: R. K. Pretty, but we think we have seen as good.

WHITE APHIDES ON TOMATOS AND OTHER PLANTS: Conyn Hill. You will do better by using a solution of tobacco-water as a wash on the plant will bear, in which a little soft-soap has been dissolved. What are not killed outright will fall on the ground and die there. A repetition of the syringing will be necessary.

* * * All communications intended for publication should be addressed to the "Editor." Such communications should be written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

THE ALLUVIAL MANURES

are made from a peculiar deposit of SEA-WEED, MUSSELS, BONES, FISH, and FISH AND BLOOD. By systematically varying the mixtures of these materials a dozen varieties of Manures are produced, each compounded specially to suit its own group of plants. This system has been tested, approved of, and adopted by leading Gardeners throughout Europe, on 1-bushel being tried by all lovers of plants. In packages for one pound. Prices from 1s. 6d. per cwt. and upwards. Particulars 1s. free.

THE ALLUVIAL MANURE COMPANY,
 26, MARK LANE, E.C.

BRESON'S MANURE is the best for all Horticultural Purposes. Sold in tins, 12, 25, 60, 5s. 6d., and 10s. 6d., or cwt. bags, sealed, 13s. each. By all Nurserymen or Seedsmen, or direct from Carbrook Bone Mills, Sheffield. Also pure CRUSHED UNBONED BONES, any size, and guaranteed of the best quality.

COLLYER'S DRY CONCENTRATED PURE ORGANIC MANURE.

Report of Analysis of a Sample of this Manure by H. MEADOWS, Esq., M.A., F.R.S., Analyst, Leicester:—

Moisture ..	6.5 per cent.	The organic matter contains 7.4 per cent. of Nitrogen, equal to 0.6 ammonia.	
Alkaline Salts ..	5.2 ..	Ammonia ..	0.6 ..
Ammonia ..	4.0 ..	Organic Matter 75.4 ..	Analysis ..
Organic Matter 75.4 ..	Analysis ..	6.1 ..	
Iron ..	0.0 ..		

This is an article that will greatly commend itself to those who try it. It is the best Manure for all purposes that can possibly be procured, and is in such convenient form for using, being perfectly dry and sound in odour for every kind of flower and plant. We recommend it, and send it, slightly carbonated, when its effects are wonderful and durable as well. Full particulars in Circulars, Nos. 1 and 2.

We have decided to send small quantities by Parcel Post, at very cheap rates, and after Purchasers have tested it we know more will be wanted, when we will put them on very best terms for quantity.

Sample packets, nearly 1 lb., post-free, 9d.; quarts, 1s. 6d.; half gallons, 2s. 6d.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a variety of unprincipled imitations, is fully attested, & it is constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
 From ALFRED LOWE, Esq., *The Express, Alderley Lodge*. "Some twenty years ago, I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Fine Illustrations of CASTLES, FENCING, HURDLES, FIELD and Entrance Gates, &c., sent free on application to—

HILL & SMITH,
 Briefly Hill Ironworks, near Dudley;
 118, Queen Victoria Street, London, E.C.; and
 25, St. Stephen's Green, Dublin.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The tiles are of superior quality, and are especially suited for KITCHEN GARDENS, as they harbour no insects, and take up little room, and, once put down, incur no further labour or cost.

as do "grown" Edgings, consequently being much cheaper. **GARDEN VASES, FOUNTAINS, &c.**, in Artificial Stone, very durable and in superior style, and of great variety of design.

WANTED, ROCKWORK BUILDERS.—Wanted WM. CLAHAM, Rockwork Builder and Landscape Gardener, Bramhall Park, Stockport.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on an envelope by which to identify the advertiser. This in all cases creates a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish Repeated.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners. Under Gardeners, Bailiffs, &c. WM. Seed Trade. SHOPMAN, or ASSISTANT.—Age 25; 11 years' experience in all departments; at present First-Corner Hand in a Scotch House. First-class references.—D. C. FLETCHER, 112, Eglinton Street, Glasgow.

HOLLOWAY'S OINTMENT and PILLS.—Autumnal Remedies.—Towards the fall of the year countless causes are at work to lower the tone of the nervous system, which will be followed by ill-health unless proper means be employed to avert that evil. Holloway's far-famed preparations supply a faultless remedy for the most distressing and internal complaints connected with changes of season. All affections of the skin, roughness, blotches, pimples, superficial and deeper-seated inflammations, erysipelas, rheumatic pains, and gouty pangs strike speedily to the exteriors of Holloway's Ointment and Pills; which will effect a happy recovery in the patient's condition, though the symptoms of his disorder are legion, and have obstinately withstood the best efforts of science to subdue them.

MILFORD NURSERIES, NEAR GODALMING, SURREY.

IMPORTANT FOUR DAYS' SALE OF FIRST-CLASS NURSERY STOCK.

N.B.—The Nurseries are situated ¾ of a mile from Milford Station, and 1 mile from the new Godalming Station on the direct Portsmouth line.

Extract from the "Lady's Pictorial" of 23d Oct., 1886.

"Most of our readers are already familiar with the beauty and merit of the Darlington Dress Fabrics Manufactured by Messrs. HENRY PEASE & Co.'s Successors, at the Mills, Darlington.

"The Novel Patterns and Designs especially prepared for the present season are exceptionally successful, both as regards colour and texture, and we can thoroughly recommend these goods to the notice of our readers as being entirely suitable for autumn and winter wear. Large Boxes of Patterns will be sent immediately upon application at the above address, and the novelty and beauty of the fabrics will quickly con-

vince our readers that they deserve the highest praise.

"It is impossible to over-estimate the immense advantages of obtaining goods in this manner direct from the original manufacturers, since there remains literally only one man, and therefore only one profit, between the wool-producing animal and the person who eventually wears the woollen goods. Where there is only one profit to be made, as in this case, it is clearly evident that the purchaser must benefit largely, since there is no middle man to swallow up the intermediate gains. This being so, our readers will do well to make the most of their opportunity, and write at once for Patterns, which are naturally greatly in demand at the present season of the year.

"We must mention as specially appropriate just now the Darlington Cross-warp Serges, the all-wool *foules*, and the Gold Medal Cashmeres, for these materials, together with all the other Darlington Dress Fabrics, are fine and soft in texture, artistic in colouring, and entirely novel in design."

HENRY PEASE & CO.'S SUCCESSORS, DARLINGTON. [Established in 1752.]

RICHARD SMITH & CO.,
WORCESTER.

VICCARS COLLYER & CO.,
Central Nurseries, Glanfield, near Leicester.
(Glebe-croft—Christal, Leicestershire).
INTRODUCERS of the now famous "Wilson Junior" BLACKBERRY price 7s. per dozen, 50s. per 100. Orders now being executed from home-grown plants produced from raiser's own stock. These are lifting in splendid form. Full particulars, with instructions for culture and illustrations of training, gratis and post-free.
Send for circulars, with particulars and analysis of COLLYER'S DRY CONCENTRATED PURE ORGANIC MANURE, gratis and post-free. This has already made a scathing impression, and no wonder.
THE COMING JUBILEE.
"Nursery" Rhyme and Reason
To keep the coming Jubilee,
And manifest our Loyalty,
Thus emulating Royalty,
Let each one plant a tree.
The above idea will be largely entertained, and it will certainly be pleasant to have in all parts of the Kingdom living remembrances of our illustrious Queen's Jubilee. A tin of an endless choice can be made either for beauty, or benefit, or both. Now is a good time to order to secure select plants. We have several seedlings in different departments that will be called Jubilee, one or two for the prompt, and the remainder for the autumn of next year.
Send for Catalogue and Special Fruit Lists, free.

HERBACEOUS AND ALPINE PLANTS.

CATALOGUE of 50 Pages, containing full information as to colour, height, situation, time of flowering, &c., free on application.
A CAPITAL COLLECTION for ROCKS, STUMPS, and BORDERS, from 25s. 10s. to 4s. per dozen.
Most of the Plants being in Pots may be despatched at any time, or by Forced Post when fit.

J. WEEKS & CO'S PATENT DUPLEX UPRIGHT TUBULAR BOILER,

With Hollow Furnace Bars, Patent Diaphragm, and Fuel Economiser.

WEEKS'S BOILERS are beyond all comparison those which offer the Greatest Value to Purchasers, and most combined advantages to Gardeners. Their merits so far exceed those of any other Boiler that almost every new Boiler brought into the market in some degree imitates them, and this notably with respect to the Hollow Furnace Bars, the use of which has been advocated by J. WEEKS AND CO. upwards of 40 years, and who have proved that the Water gains on an average from 20 to 25 degrees of heat in its passage through their Hollow Furnace Bars before entering the Boiler.

Full particulars, and Illustrated Price List of Boilers, also New Book of Designs, 13th edition, post-free on application.

WALTHAM CROSS, N.

HELLEBORES,

OR

CHRISTMAS ROSES.

I am very pleased to be able to offer a magnificent lot of Christmas Roses, probably the finest lot in the trade. All the varieties now offered are strong Home-grown Clumps, full of Flower-buds, and I would advise Early Orders to secure them, as I know the stock of fine Clumps is very limited this season.

NIGER CAUCASICUS.

An intermediate form between major and maximus, having dark mottled stems and dark green erect foliage. The flowers are large and very conspicuous, pure white when flowered in a cold frame or even where protected by shrubs, but when fully exposed the outside of the petals are slightly tinted with rose. It is one of the most vigorous of the Christmas Roses, and one which will succeed where some of the ordinary varieties fail.
Fine Strong Clumps full of Flower-buds, 1s. 6d. and 2s. 6d. each, 18s. and 24s. per dozen.

MADAME FOURCADE.

This is a gem: flowers of medium size, snow-white, and produced in the greatest profusion, the very smallest plants flowering; the foliage is light green, of a spreading habit, and a very robust growth, quite distinct.
Strong Flowering Clumps, 1s. 6d. and 2s. 6d. each, 18s. and 24s. per dozen.

MAJOR.

Although this plant is frequently offered, it is seldom to be obtained true to name, owing to its great value for cutting purposes. The flowers are pure white under glass, but have a slight rosy tinge in the open; it is the greatest favourite among market growers, producing flowers from December to January. It is a grand variety for potting; the foliage is so close and compact, and the flowers abundant.

Fine Strong Clumps, full of Flower-buds, 1s. 6d. and 2s. 6d. each, 18s. and 24s. per dozen.

MAXIMUS.

A robust variety, the largest of the group, and very ornamental as a foliage plant. The blossoms are large and white, shaded with rose on the exterior, and generally produced in twos, but if shaded or a glass placed over the plants the flowers are then pure white. By shading, the flowers can be retained even to December. It is the most vigorous of the section, and succeeds where many of the others fail to grow.
Extra Strong Flowering Clumps, 2s. 6d., 3s., and 4s. 6d. each; 24s., 30s., and 48s. per dozen.
Smaller but still Flowering, 1s. and 1s. 6d. each, 10s. 6d. and 15s. per dozen.

RUBRA.

One of the most distinct and novel of this group, a veritable red Christmas Rose. The flowers are large and produced about the end of January, and are of a lovely rose colour. It is a robust growth, very free blooming, and a decided acquisition for cutting purposes.

Strong Flowering Clumps, 2s. 6d. each, 24s. per dozen.

NIGER.

I have just received a very heavy consignment of these, which are really one healthy stuff, full of flower-buds—I think the finest batch of imported Hellebores which ever reached me.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 13, 1886.

ARDDARROCH.

(SEE SUPPLEMENTARY SHEET.)

ON an amphitheatre-like groundwork, springing from the upper reaches of the waters of Loch Long, is situate the demesne of Mr. R. D. White, of Arddarroch. It is situated on the outer confines of Dumbartonshire, and commands that combination of feature which so much delights the general tourist—chains of hills as wavy in their sky outline as the South American Cordilleras, with sufficient breadth of water, while the steamers pass up its midst for the eye to command on both sides the masses of rock, here clothed with arboreal vegetation, both deciduous and evergreen—there empurpled with thousands of acres of Heather, and which seems to revel all along the lochs that fork out from the estuary of the Clyde into Dumbartonshire and Argyleshire.

Arddarroch is one of the places that show what judicious expenditure can do by way of extending the resources of Nature and enhancing the value of land. While thousands of acres on the opposite side of the loch are still, so to speak, in a state of Nature, in so far as the outcome is probably only a few shillings per acre for grazing purposes, this estate, certainly limited in size, is well planted, and although timber hitherto has not been very remunerative, the forests of America and the Baltic, in the progress of civilisation and the multiplication of the population, will not last for aye. It is a pity to see so many thousand acres left exclusively to the shepherd, the sportsman, and their dogs.

From a landscape point of view this residence is admirable. There are so many vistas and broad reaches in the foreground, opening up all the variety of prospects presentable, as would delight the landscape gardener. Down towards the estuary the hilly portion of the ground on the Holy Loch strikes the eye, and then nearer the foreground comes Loch Gill, where the chief of Ulva's Isle with Lord Ullin's daughter, in Campbell's stirring legend, met a tragic end, and with it the charming grounds of Sir John Douglas, of Glenfinnart. Up the loch towards Arddarroch the great hills of Ben Arthur or the "Cobbler," Benvoirlich, and away in the far distance Benmore, in Perthshire, supply a background that commands universal admiration.

Turning to the house itself, it covers a considerable area of ground, and has commodious reception rooms, with a serviceable conservatory attached. Its front is covered with a variety of creepers, none more interesting to the writer than a well bloomed plant of Desfontainea spinosa, clad with its orange and scarlet tubular flowers, looking all the grander that they are set in a profusion of the Holly-like leaves of the plant. This is so seldom seen as a climber planted out north of the Tweed, that a special note was made of it as being a particularly eligible plant for the milder climate of our Scottish lakes. Tropæolum tricolorum was

exceedingly rich. Nothing for profusion or colour as a climber can beat this where the climate favours it. The grounds immediately adjoining are well clothed, not inconveniently crowded, with trees of ornamental character. Among the larger of them are the Oak, the Ash, the Lime, and the Birch, and these interspersed with such well known and much appreciated Conifers as the Wellingtonia, the Araucaria imbricata, the Cryptomeria japonica, here simply in perfection towering from 40 to 60 feet high, and faultless in symmetry. Of lesser altitude, but striking amongst their fellows, are the glaucous variety of *Abies nobilis*, a pretty Crimean Silver (*Abies Nordmanniana*), several faultless *Picea Menziesii*, and the Lawson Cypress (*Cupressus Lawsonii*) in quantity. The Scots Fir and Larch are timber trees of value. The *Rhododendrons* luxuriate almost beyond compare here; hybrids in quantity in great masses 20 feet high, and the catabiense seedlings among the bracken (*Pteris aquilina*). Then the Ghent Azaleas are equally remarkable for luxuriance, mollis overtopping them although only half their age.

Just within easy distance of the first lawn, and in juxtaposition to a rather quaintly-designed kitchen garden, stand the

ORCHID-HOUSES.

Of these the proprietor takes a large and lively interest, and he appears to be ably seconded and supported by his head gardener, Mr. Kidd. The collection has not been very long in existence, but in these days the affluent cannot wait, and the consequence is that whereas it took a good ten years to make a decent show of Orchids in the days when I was an apprentice-hand scarcely ten months are now required. Chief, in the meantime, amongst the groups, in the half-dozen compartments devoted to Orchid culture are the *Cattleyas* and their congeners. One is struck to see the great quantities of *C. Dowiana* cultivated, and well cultivated too. In 1872, just fourteen years ago, the subscriber flowered one, and it was the first of them, to the great delight of all who beheld it; but what must be the scenic effect of a couple of hundred, not in pieces of ten or a dozen pseudobulbs, but in lumps covering rafts and baskets, and seemingly going along well! This was not always the case. Often the young pseudobulbs were suffocated with the outer sheaths enveloping them too tightly, and hence the mishaps of the early days of cultivation; but now they seem to go along well suspended, near the light, not overdone with peaty lumps—at least, such is the case here, and the condition of the plants was entirely satisfactory. *C. Eldorado* was flowering and growing profusely suspended in the same way as *Cattleya Trianae*; *Mossia*, *Gaskelliana*, *Sanderiana*, *gigas*, *imperialis*, *et hoc genus omne*, were treated to pot culture in stages, and so was *Lælia purpurata*, *Cattleya Skinneri*, and the white form of that species, and all doing very well. In the same temperature *Dendrobium Wardianum* was exceptionally good, and the young growths up to the extremity, clean and faultless; so also was *Dalhouseanum*, sometimes not very well "done." Then *Cypripedium Spicerianum* was particularly noticeable, and so were *Vanda cœrulea*, *Grammatophyllum Ellisii*, *Oncidium Marshallianum*, certainly a magnificent species, that will long connect Mr. Marshall's name with the Orchid world.

In the cooler houses were batches of *Odontoglossum crispum* and its now endless varieties, *Pescatorei*, triumphans, *cordatum*, together with splendidly grown plants, not of large size, but clean and pleasant to look upon, of *Odontoglossum vexillarium*. The lot comprises chiefly the small-flowered ruby variety, and it certainly is a very captivating form, contrasting well with that excellent yellow-flowered *Oncidium*, which

everybody now calls *Rogersii*. There were a few nice pieces of the comparatively scarce *Oncidium macranthum* and some *Oncidium nubigenum*, *Cattleya citrina*, *Masdevallias*, and *Epidendrum vitellinum*.

In several other houses were imported plants of both hot and cool temperatures, coming forward for taking their places in time among those established. What a charming addition to *Orcids* is *Jonesianum*. It is a veritable gem, so summer-looking in its features, although wearing the foliage of the whip-like *Scuticaria*. It seems to be an excellent raft plant, although there may be some difficulty in growing it into specimen size. Mr. White has taken to those pots of an irregular corrugated nature that will not take in slime and dirt very readily, and moreover have the advantage of a bottom tray for water, and longitudinal air-holes under the portable bottom, which fits into each pot; it seems to be a good thing.

The conservatory has its walls almost covered with the red and white *Lapagerias*, and in its centre at the time of my visit was a magnificently flowered *Lilium auratum* of the broad segmented and deep orange rayed variety, bearing over fifty flowers in two spikes.

The whole place is in excellent keeping, and the genial proprietor and his lady seem to enjoy it, and are likely to keep up its character as a summer and autumn residence. *J. Anderson, Meadowbank.*

New Garden Plants.

CATASETUM GALERITUM, n. sp.*

I HAVE at hand an inflorescence of seven flowers, which are nearly half as large again as those of *Catasetum atratum*, Lindl. Median sepal and petals connivent, ligulate-acute, light green, spotted with numerous transverse purple-brown spots. Lateral sepals turned back, broader, with numerous round spots of the same colour. The spots are very well marked, and of very elegant colour inside, but, as is commonly the case, far less remarkable outside. The lip is long and narrow, and very curious. The hypochile has rather upright borders, angled on each side in front of the base, leading to a blunt conical spur that is pressed under the very strong oblong-acute epichile, with reflexed margins just as in the spur in the group of *Acridies* affine. The anterior blade (epichile) is ochre-coloured, the remaining part is green with a brown area close to the yellow margin, and there are some scattered brown spots outside under the brown areas, and there are brown lines inside on a yellow ground. The bristles of the purple column are unusually strong. It is near *Catasetum atratum*, but is totally distinct in the lip. The flowers are far more conspicuous in the bright colour of the sepals and petals, and look rather pretty for those of a *Catasetum*. It was kindly sent me by M. Lucien Linden, Director of the Compagnie Continentale d'Horticulture, Ghent, *H. G. Rehb. f.*

CATASETUM PILEATUM, n. sp.†

A curious species, which, in the breadth of the lip, the ivory-like broad lip, the whitish colour, reminds one of *Mormodes luxatum*. It has rather large flowers, like those of that plant. Sepals narrow, large, ligulate-acute, light reddish. I am, however, by no means sure whether the colour is natural, or a consequence of withering. Petals broad, oblong-

acute, white. Lip a wide nearly triangular obtusangled expansion, descending at the base into a blunt cone. Column white, with a very long apical beak, and two well developed cirrhi. A specimen has been kindly sent to me by Messrs. Linden. *H. G. Rehb. f.*

DENDROBIUM NYCTERIDOGLOSSUM, n. sp.*

THIS is a new member of the *Aporum* section of *Dendrobium*. The leaves are like those of *Dendrobium sinuatum*, Lindl., but the habit is that of *Dendrobium Serra*, Lindl., inasmuch as the very small green flowers are produced in fascicles, flowering in the specimens at hand singly from the upper and ultimately leafless part of the stem. The flowers are green, striped with very dark red, both sepals and petals developing a distinct mentum. The lip has a very short stalk expanded into a transverse blade, the side lacinia broad, triangular, the central lacinia very short, retuse. It is light green, with a dark green spot on the disc. I compared this lip to a bat, whence the name. This lip is quite of a new form, as I know of no species with a similar one. It was kindly sent me by M. Lucien Linden, who states that it is of Papuan origin. *H. G. Rehb. f.*

MAXILLARIA FUCATA, n. sp.†

THIS is near *Maxillaria irrorata* of Sir Charles Strickland, but it has no powdery cover to the lip. Such powdery masses are formed by the fragile hairs, which often contain starchy granules, such as I saw first in *Maxillaria anatomorum*. The sheaths under the bulbs are light brown, with darker spots. The leaves are on narrow petioles, 5 to 7 inches long, with an oblique articulation in the middle, the blades being ligulate, lanceolate, acuminate, one inch in breadth, about 1 span in length. The peduncles are of the same length. The narrow, acuminate sheaths do not quite touch one another, as they do in *Maxillaria irrorata*. The bract is also narrow, sometimes as long as the stalked ovary, at other times not. Sepal triangular. Lateral sepals rather broad. Lips reflexed. Mentum very blunt. Petals rhomboid, blunt-angled at the sides, with reflexed tips. Lip oblong-elliptical in outline, trifid at the anterior border, side-lacinia rounded, central lacinia small, semi-oblong, emarginate. A ligulate, retuse callus extends from the base to the middle. Column three-sided, whitish, yellowish at the base, with red spots under the fovea. The flower is nearly 1½ inch long, white outside, probably like the borders of the sepals and petals purple. The inner surface of the sepals is white at the base, purple in the middle, yellow, with red spots at the apex. The petals are of the same colour as the sepal, but without spots at the apex. The lip is ochre-coloured, and the marginal parts of the side-lacinia brown on the inner surface, with parallel brown stripes on an ochre-coloured ground.

This fine species was kindly sent me by Sir Trevor Lawrence, Bart., M.P., F.R.H.S., &c. I saw it afterwards at Burford Lodge in company with Messrs. J. Day and W. Lee, but, unfortunately, in the absence of the fortunate possessor.

The distribution of colour is very uncommon. I could not help remembering some harlequins I had seen with the paint not quite washed off their faces. *H. G. Rehb. f.*

THE BLACK WALNUT.

VERY few, if any, examples of this remarkably handsome North American Walnut (*Juglans nigra*) are to be found in Europe equal in age and size to those growing in the pleasure-grounds here. As will be seen by reference to the engraving (fig. 120) the two trees are growing within a few feet of each other. The circumference of the main trunk of each at 4 feet from the ground is exactly 129 inches, and both con-

* *Dendrobium (Aporum) nycteridoglossum*, n. sp.—Affine *Dendrobium Serra*, Lindl.; foliis ensiformibus mucronatis carinis; floribus ex caule superiorum demum aphyllis; sepalis impari oblongo acuto; sepalis lateralibus triangularibus obliquis; tepalibus linearibus acutis unimurvis; labello brevis unguiculato, transverso trifido, lacinia lateralibus triangularibus divaricatis, lacinia mediana quadrata; columna oviformi. *H. G. Rehb. f.*
† *Maxillaria fucata*, n. sp.—Proxima *Maxillaria irrorata*; foliis longe petiolatis linearibus ligulatis acuminatis; pedunculis plurimurvis; vaginis angustis, mento obtusa gulo sialido; sepalo impari tri-lobato, sepalis impari lato triangularibus, anice trilobis, sepalis rhombicis parvis apice reflexis, labio elliptico, antice trifido, lacinia lateralibus oblongo semi-rhombicis, lacinia mediana parva semi-oblonga a. a. emarginata bilobata; columna trifida. Vid. nov. illustr. arbor. Burford Lodge, &c. acc. ab exc. Eg. Trevor Lawrence. *H. G. Rehb. f.*

tinue of the same dimensions for fully 15 feet higher. Both have attained a height of between 90 and 100 feet, and the diameter of the spread of their united branches is 80 feet the narrowest, and 120 feet the widest way. One of the large branches gradually dropped to the ground many years ago, and the main point has nearly assumed a vertical position, forming a miniature tree; but whether the portion of the stem which is partially buried underground has roots or not I cannot say. The trees are in excellent health, and every year bear heavy crops of nuts, but these only in rare

As regards the history of these remarkable trees there is no doubt that they were planted at the same time as the other North American trees, Mesquits, Sugar Maple (now dead, but formerly an exceedingly handsome specimen), Cock's-spur and scarlet fruited Thorns, in the seventeenth century, by the then occupier of this estate—a gentleman either officially or commercially connected with North America. It is thought by some local historians that the Walnuts were planted by John Evelyn, as he frequently visited this neighbourhood and planted a great many Plane and Cedar trees, but there is no

beneficial effects of London smoke. Even the Oaks and Elms are decaying rapidly, and we gradually meet with difficulties in the way of keeping many of our choice alpenes alive. *T. W. Sanders, Gr. to J. W. Larking, Esq., J.P., The Firs, Lee, S.E.* [This is the tree so much valued in the States for its timber, used for gun-stocks and cabinet-work. A curious feature is the frequent existence of two or even three buds in the axil of the same leaf, so that if one shoot gets nipped by spring frost there is another bud to take its place. It is a true Walnut, and not a Hickory. *ED.*]

FIG. 120.—BLACK WALNUT TREES AT THE FIRS, MANOR LANE, LEE, S.E. (SEE P. 616.)

instances become fully developed. Although I have opened hundreds of the nuts I have found none but what were destitute of albumen and embryo, the testa merely containing a small amount of watery liquid. This is, no doubt, due to imperfect fertilisation, or want of it. I have always observed that the male flowers appeared many weeks in advance of the female ones, and in consequence of this I have come to the conclusion that the pollen is either injured by the cold winds or distributed before the female flowers are open to receive it. I intend this next season to preserve some of its pollen, and artificially fertilise a few flowers with a view to determine whether my theory is right. [Probably the latter is the more correct view. *ED.*]

direct confirmation of this fact. By whomsoever or whenever planted they have formed the noblest and handsomest of ornamental trees, and are justly prized by my employer, to whom the late Sir William Hooker, in one of his visits here, described them as unequalled for size in Europe. It will be seen by the dimensions which I have given (and they are under rather than over the mark) that they far exceed in stature the typical species in its native habitat, as given by Michaux in his splendid work, *The North American Sylva*.

It is to be hoped that these trees will not suffer the same fate as our Cedars and Conifers generally (excepting, however, *Cupressus Lawsoniana*), and many other fine trees, and gradually succumb to the

TREES IN THE WRONG PLACE.

It may often occur to planters who observe the ill-health of the trees they have planted that the sorts selected were not those which should have been chosen for the particular soil or site. Amongst no trees does ill-health manifest itself so soon as in the various Conifers so commonly planted either to form plantations or as ornaments to the demesne and garden.

Provided the removal of surplus water has been secured by means of rubble drains and open ditches—never by pipes or tiles alone—if trees suitable to the soil be chosen, and with due regard to exposure and shelter, there is no reason why Coniferous trees and

others should not grow into handsome specimens as garden and park trees, and into profitable timber as woodland trees, without much, if any, further trouble or expense. The means often adopted to secure healthy growth in trees in bad soils and undrained sites by throwing out a trench around the trees and filling it with suitable soil, and by surface feeding, can never be adopted in a wholesale way by many owners, owing to its cost. As an example of a soil suited to Conifers, and to little else, we may cite Dromopore. There the drainage, either natural or artificial, is about perfection, and thus, although the crust of soil is of but little depth, and is of a light nature, the trees have made wonderful progress. Much of this fine development is due to properly prepared sites in the first instance, but which the trees have long ago outgrown, and to natural surface feeding. The rake and the broom were never wielded by a worshipper of over-neatness at Dromopore, so where the Pine-needles fell, and the other foliage, and the woodland Ferns and weeds died down every year, there all was allowed to rot into mould, than which no better could be devised by man for the proper support of the trees. In special cases there, extra surface feeding has been and is practised now, but there is no general following out of the practice, and it is, moreover, unnecessary.

As regards the species of Conifers to plant as timber, the selection made by Mr. A. D. Webster in last week's *Gardener's Chronicle* is a very good one, only he puts *Pinus strobus* into the position of a first-class marketable timber tree, which I think it is not; the timber is soft and perishable, and fit for indoor work only. The tree is very handsome, either in groups, rows, or as single specimens, especially when old and has acquired the massive umbrella-shaped head and clean reddish-brown bole. *M.*

BOTANICAL RAMBLES IN SOUTH CHINA.

(Continued from p. 510.)

IN the same grove I also found a large bush of the showy *Casalpinia minax*, a plant only previously found near Sha Hing, on the North Canton River, and described by the late Dr. Hance in the *Journal of Botany* for December, 1884. It is described as "a most interesting plant, remarkable as a singularly distinct member of the small group to which it belongs."

Emerging from this little wood we reached a ravine which leads to the top of a hill nearly 3000 feet high.

This was the happy hunting ground for new plants, and the hard work of the day now begins. I was attended by three coolies, one carrying a couple of large baskets, slung Chinese fashion, on the inevitable Bamboo pole; another with a vasculum and a number of sheets of drying paper fixed between two flat boards; the third carrying the provisions for the day. The temperature in the shade was considerably over 70° F., but we will not venture to say what it was in the sun; it was simply incandescent! The ravines I speak of form a natural channel for the mountain torrents. I was shod with a pair of shoes with corrugated indiarubber soles, which enabled me to cling to the smooth slippery rocks. Getting wet feet and legs is, of course, rather convenient than otherwise, as it helps to keep the extremities cool! The vegetation, which is purely indigenous, generally extends from 20 to 60 yards on each side of the stream. It would be impossible to push one's way through the entangled mass of thorny shrubs unless the stream had kept a passage clear. This dark green passage has the advantage of enabling one to get a view of both sides. At intervals in the ascent the hill slopes back, forming a flat landing, the stream consequently broadens and waters a wide plateau. I do not know any feeling to equal the charm of exploring these sequestered nooks with the sense that you are the first European that has invaded them.

For ages the mountain torrent has been gradually deepening its bed, and has formed a fertile ravine sheltered from cross winds. Many of the huge irregular rocks and boulders that recede high above the stream on both sides are channelled and water-worn, showing that they, at some remote period, had been subjected to the "water that wears away the stone." And the soil that still remains in the crevices and in the deep passages between the rocks is the fine alluvial sand and mud of an ancient watercourse, mixed largely, of course, with the decayed vegetable

matter of many years. A large number of plants have here been preserved that would probably have otherwise become extinct. The rocks are clothed with Mosses, Ferns, Orchids, and innumerable trailing and creeping plants. On the moist rocks and in shallow pools *Aspidium calcareum*—a plant that takes the form of a small tree-Fern—grows abundantly. Adjacent to this we see *Selaginella Wildenowii*, *S. atroviridis* and *S. flabellifera* spreading at will. A little higher up the forbly *Angiopteris evecta* stretches its enormous fronds over its meaner neighbours. Sometimes we see a large rock covered with the strong erect fronds of *Polypodium coronans*, its broad shields completely hiding the rock. In a boggy situation I found the handsome *Asplenium maximum* the only specimen of this that I have seen. *Polypodium longissimum*, Bl., grows on dry banks; this I believe has not hitherto been found in China. Both on the rocks and on the earthy slopes we see *Gleichenia longissima*, *Asplenium nidus*, *A. cuneatum* (a most beautiful Fern), and *Gymnogramme decurrens*. The very common kinds are *Asplenium esculentum*, *A. latifolium*, and *A. ruticolum*. The rarer kinds of the genus *Asplenium* are *A. normale*, *A. Oldhami*, *Hancei*, which, by the way, Dr. Hance remarked that he could not distinguish from *A. Hancei*, Baker, and *A. Griffithianum*—the latter also new to China.

The minute *Polypodium flocciferum* and the modest *Davallia pedata* cling to the dry rocks. *Polypodium trichidum* is also a rock plant, but likes a damp situation. *Davallia divaricata* is a most accommodating plant; it can be found on dry rocks in the full glare of the sun or dipping its graceful fronds into the stream in the dense shade. *Polypodium lanceum* and *P. superficiale* hide themselves in wet, dark, cool crevices in company with several species of filmy *Hymenophyllum*. *Asplenium Hancei* and *Aspidium aculeatum* mostly frequent the tops of rocks that are covered with a thick coating of soil. *Aspidium aristatum*, *A. unatum*, *A. molle*, *A. subtriphyllosum*, *A. exaltatum*, *A. ciliatum*, and *A. tuberosum* are all common plants that can be met with on every side. Dwarf trees are often covered with the creeping *Drymoglossum carinatum*.

Amongst the long grass the cosmopolitan *Osmunda regalis* and *Pteris aquilina* are growing in large numbers; the latter plant has a very subdued and retiring look in its tropical home. One would hardly think that this dwarfed thinly-branched plant was the sturdy Bracken of the West. Under similar conditions we find the unique *Brainea insignis*. *Woodwardia Holandii*, *Osmunda javanica*, and *O. bipinnata*. In the same grassy situation I found the handsome *Hemionitis Griffithii*, hitherto only found in Formosa. In one of the cave-like recesses behind a waterfall I found a semiaquatic *Asplenium* of filmy texture, pronounced by Dr. Hance to be quite new. The fronds are black-green when they are kept constantly wet by the spray. The fertile fronds are very difficult to find in consequence; it was only when the plants were temporarily deprived of their bath spray in the dry season that Nature strove to reproduce the plants by spores. It has graceful fronds from 8 to 16 inches long, with broad, drooping, truncate cuneate pinnae, and is closely allied to *Asplenium Viellardi*, Mett., from New Caledonia. I find that it is easily cultivated if regularly syringed, and if it can weather the trials of transport in a Wardian case it may yet find favour with Fern growers at home.

The vegetation of the rocks is wonderfully varied and interesting. High up in almost inaccessible shelves is the curious *Dischidia chinensis* exposed to the drought and fierce heat of a tropical sun. This dark green rosette-formed *Selaginella involvens* delights in a similar situation, but is also found in the shade between the rocks. The creeping *Pothos scandens*, *Psychotria serpens*, and *Hoya carnosus* spread thickly over the dry hot granite. Large masses of *Ptilodota chinensis*, *Eria rosea*, *Ceolophya fimbriata*, and *Bolbophyllum radiatum* luxuriate in astonishing quantities on nearly every boulder. *Acaeme multiflora* and *Cymbidium aloifolium* frequent every crevice. *Phaius grandifolius*, *Spathoglottis Fortunei*, *Arundin chinensis*, *Limnoloba gracilis*, and other terrestrial Orchids, are plentiful among the long grass. *Cypripedium purpuratum* and *Goodyera procera* are occasionally met with in shady hollows.

In the present paper I can only venture to mention a few of the most striking of the trees and shrubs. They would require a volume to themselves. One of the most beautiful of these is a rare *Melastoma*—*Dis-*

sechæta Barthei—now extinct in Hong Kong, but common enough at a height of 2000 feet on the neighbouring hills on the mainland. The lovely pink and white flowers are fleshy and wax-like, and form terminal clusters that frequently envelope the plant in a glow of delicate blossoms. I regret to find that it is difficult to propagate. Its apparently limited distribution enlarges its existence, for, like many of the rare indigenous plants of the Chinese hills, it is rapidly disappearing before the extirpating axe of the woodcutter.

Another plant of pre-eminent beauty is the *Symplocos decora*, very rare in Hong Kong, but also fairly abundant on the hills of the mainland. It is a small evergreen tree, with dark green Holly-like leaves, and bears dense clusters of white blossoms, sometimes slightly tinged with azure-blue. A sprig of the blossom blended with the dark green leaves has a charming effect in a vase or a specimen glass, or in the hair of a ball-room belle. Such plants as *Photinia prunifolia*, *Syrax odoratissima*, *Homalium fagifolium*, *Magnolia Championii*, *Turpinia arguta*, *Gordonia anomala*, *Gelsemium elegans*, *Camellia reticulata*, *Marlea begoniifolia*, *Viburnum odoratissimum*, *Eiobrytra fragrans*, *Melolobium glucoessens*, and *Enkianthus quinqueflorus*, make the ravines gay and fragrant with their flowers.

Two trees of very ornamental habit are *Cunninghamia sinensis* and *Podocarpus sinensis*. This latter plant was found originally by the Rev. E. Faber on the Lo Faw mountains, west of Canton, but was not then in flower. I subsequently found a solitary plant with male flowers on the top of Tai Mo Shan, and from my specimens Mr. Hensley inadvertently named it, not knowing that Dr. Hance had previously named the plant. Quite recently I discovered a number of these plants on the island of Sutoa, west of Hong Kong, from which I hope to get female flowers this year. If it proves to be hardy the beauty of its foliage and the gracefulness of its habit would make it a valuable acquisition as a lawn tree. *A. B. Westland, Botanic Gardens, Hong Kong.*

(To be continued.)

BEE'S WAX.

A WRITER on bees in the *Examiner*, a New York religious newspaper, says that bees make wax from honey. He may reason thus; honey sustains the bee, the bee produces wax, therefore wax comes from honey. Before the habits of bees had been studied, it was supposed that wax was collected from flowers, but later investigation shows that that wax is a natural secretion of the bee. It exudes from the body between the rings, in minute scales. These the bee takes in his "hands," works like a piece of dough, and places where it is needed. If comb building is in progress, he deposits the piece of wax on the edge of a partly built cell; another bee then attacks it, gives it a twist or a pinch, and smooths it with his mandibles. Sometimes three or four bees will find something to do with that particular crumb of wax. The workers are so many and work with such rapidity, and do individually apparently so little, that the eye hardly perceives, in a short interval of time, that the structure, the comb increases in size, but close the hive, examine the same cell in an hour, and its greater length is seen at once. Evidently wax is present when it is wanted, and absent when there is no use for it. This may not be the case, but appearances favour it. If there be no more room in a hive for comb, no wax, or very little, is needed, but if an empty frame be placed in this hive, the bees begin at once to fill it with comb. If the bees secrete wax in a full hive, what becomes of it? Does the bee dislodge the wax scales on the wings? Sometimes these tiny scales are found in the bottom of the hive, but the quantity found there would build only a fraction of the comb built in one night if space is provided for it.

The wax as it comes from the bee is white, and the comb is white for a while, but the bees use no doormat, and after 25,000 bees—6 feet a-piece make 150,000 soiled feet—have run over the comb, it becomes yellow, and finally black, or nearly so. Persons who have seen a comb from the brood chamber for the first time are surprised that it is not white—"like wax." The comb in the sample boxes remains white, or nearly so. The bees appear to be more careful in their spurs chamber, but as this surplus room is on the top of the brood comb usually they clean their feet as they ascend to it. But even

this comb would become soiled if left in the hive. On some hives thirty-two surplus t-lb. boxes are placed, and on the top of these may be placed as many more, making sixty-four in all. The first lot put on are not taken off until the outside boxes are full. This allows the bees to run over many of the boxes after they are capped, and hence it would be better to place a less number of boxes in the surplus chamber, and remove before the comb may be soiled. But this would interfere with the theory that the more room the bees have the better they work, and the less are they inclined to swarm.

If the bees be fed liberally with honey or syrup, they secrete wax more rapidly. The amount of honey fed to produce a pound of wax is not less than 15 lb., hence at the present price of best honey, 25 cents, the cost of a pound of wax, worth to-day about 30 cents, is 3 dols. at least. Notwithstanding the apparent high cost, surplus wax in an apiary is a source of profit. Every bit is preserved, melted down and sold. There has never been too much bees-wax in the market although it is imported from foreign countries. Wax is insoluble in water, and may be melted in water and skimmed from the surface. Cooled in pans of any shape it is ready for the market. But the bee-keeper does not render into wax any comb that can not be serviceable. Advertisements read, "Bees on straight worker combs." These straight combs are in harmony with men's ideas, and better for man's manipulation, but the bees may prefer a different arrangement. The writer purchased this spring black bees in a double box hive, that is, one box above another with passage-way between. The upper box was full of comb, and the comb was full of honey. On one side were three straight combs 12 inches wide, and 16 inches long, solid slabs of honey, but the rest of the comb, about two-thirds of the whole, was a labyrinth of alleys, passage-ways, vaulted chambers, and cuddly holes, from which it was difficult to drive the bees even with smoke. Two days after they had been expelled, lingering bees continued to appear. Their home was a most curious structure, and was evidently to supply just what was needed by a numerous household. *George A. Stockwell in the "New England Farmer."*

NUTRITION v. SEXUAL VARIATION.

MR. MEEHAN'S name is so closely connected with the above subject that aught he writes thereon is of more than ordinary value. Every one acquainted with living plants will at once admit the balance of facts to be as Mr. Meehan states them on pp. 600 and 601 of your last issue; but his citation of Hoffmann's paper in the *Botanische Zeitung* for 1855 makes the matter very interesting. It appears Hoffmann found that rich soil, or what is nearly the same thing—that is to say, thin sowing or planting of diocious species—conduces to the preponderance of female plants, and that the reverse—i. e., poor soil or thick sowing—conduces to the preponderance of males. In the words of Mr. Meehan (p. 600), Hoffmann "sowed seeds of numerous kinds of diocious plants closely together, so as to give little food to each plant, and the same plants thinly, so as to give each plant nearly all the food it could use." Where they were thickly sowed he counted 283 males to 700 females. In the well-fed (*i. e.*, thinly sowed) lot there were but seventy-six males. This experiment throws much light on the question of sexual fertility in the garden, and accounts in some measure for the temporary success which attends the employment of restricting stocks for fruit trees, root pruning, or by planting gross habitued fruit trees, as Figs for example, in pots or enclosures of masonry, which by limiting their nutriment renders them more fruitful, and that at an earlier age than would otherwise be possible. But this experiment of the German savant interests me more than it otherwise would have done because I have evidence of the principle it involves and inculcates, having been observed and distinctly recorded long before Mr. Meehan and Professor Hoffmann were born. Before me as I write lies a beautiful copy of Threkeid's *Synopsis Stirpium Hibernicarum*, which was published in Dublin in 1727. It is interesting as having been written by Caleb Threkeid, M.D., a native of Cumberland, who settled and practised in Dublin late in the seventeenth century, and his work above mentioned is

generally acknowledged to be the first one ever published in the English language relating to Irish plants. Now, under the head of Cannabis mas, male Hemp, we find the following, which I transcribe as it is written, word for word:—"The male Hemp has the seed, the female only flowers, yet both are procreated from the same seed. The more attentive husbandmen observe that in a fat soil you have more plenty of male Hemp—in a lean soil more of the female; or where sown too thick and so wants nutritious juice it is female." It will, of course, be observed that Threkeid, following the customary language of his time, in reality transposes the sexes in his account, but this does not in the least invalidate his evidence, to wit, that the "more attentive husbandmen" of his day knew as much on this question of nutrition and sexual variability, as does Professor Hoffmann or we ourselves in the enlightened nineteenth century. What can we do to-day more than Jacob did nearly 200 years before Christ?

Is it not in the thirtieth chapter of Genesis wherein we read that Jacob made a contract with Lohan that he should have the speckled, ring-streaked, and spotted amongst the flecks for his own reward; and I we read that, after he had culled out all the speckled cattle, he removed a three days' journey with the pure self-coloured herds, and he took rods of green Poplar, Hazel, and Chestnut tree, and partly peeled them, making "the white appear which was in the rods;" and he set these rods near to the drinking places, but he suffered the strongest and finest of the cattle only to drink near the rods, so that the stronger offspring should be his. Any one interested in nutrition and sexual fertility should read this early account of natural selection and predisposing causes of variation attentively, and they will see plainly that Jacob the herdsmen of 3000 or 4000 years ago was as "scientific" as most of us are to-day! Although we may smile in a good-humoured way at Mr. Meehan's innocent assumption that "to American botanists is mainly due the credit of the discovery that, whether a plant be male or female, or a flower on the plant be male or female, is a mere question of nutrition," yet we fully and freely acknowledge all that Mr. Meehan and his co-workers have really effected in the interests of American gardening. But can Mr. Meehan cite a single passage from an American author, or from any author on American soil, who alludes to this question of nutrition and sexual variability anterior to the year 1727? If not, we shall claim that the subject was first discovered by an English doctor of medicine practising in Ireland, and this only to have evidence brought forward that the thing was known to the Egyptians or the Phœnicians, or at least to the Greeks. It was only the other day that Mr. Caruthers told us at the British Association that the cereals of Egypt were as fine to-day as they were 3000 to 5000 years ago, and that the species of plants then common in Egyptian fields are there to-day practically unchanged! This may be true of Egypt, and not true of European kinds, and further the cultivated offshoots from these types may have become changed past recognition, as was the case with the Flax of the Lake dwellers of Switzerland as compared with the Flax of to-day. If it be true, however, it does not prove but that improved forms have been raised over and over again—raised, used, and improved and lost again during the whole period since cultivation first began.

Be this as it may, however, we have the testimony of the fossilised plants, which conclusively prove that both climate and vegetation changes during different epochs in the earth's history. Where are the living representatives of the gigantic Calamites and Lepidodendrons now? If I mistake not the fossil botanists do not, because they cannot, except in very few cases, refer the fossil species of the past to the living species of the present time! If this cannot be done, we have strict evidence of what we call evolution having taken place, just as we have ample evidence that it is taking place all around us to-day. The main tact to decide is, whether evolution takes place or not; and some day we may be able to compute the time necessary for such changes to take place. The cereals and pulse of ancient Egypt may have been very good examples, but no one, as I imagine, could prove that they are finer than the best of improved kinds as now grown in Europe and America. Even if this were true, the excellence of quality of the Egyptian corn might be traced to the fact of the cultivated land of Egypt being renewed every season by the annual overflow of the Nile. *F. W. Burbidge, F.L.S.*

Orchid Notes and Cleanings.

ORCHIDS AT MR. DORMAN'S, LAURIE PARK, SYDENHAM.

THERE are few more enthusiastic amateurs than the owner of this choice collection. November 5 is about the worst time in the whole year to look for Orchids in flower, but I was fortunate to find many plants in great beauty; the Pleionees were past their best, but *P. maculata* was very fine; it is the best in the genus. *P. birmanica* is a very pretty and distinct free flowering species; the flowers quite distinct in colour, the sepals and petals being of a pale lilac or purplish colour, the lip pale lilac with a yellow centre. The peduncles are mostly two-flowered.

Oncidium varicosum, which must be classed amongst the very best of the yellow flowered species, was beautifully in flower. There was also a handsome flowered specimen of *O. Regeri*, the flowers of which were quite 2 inches across by measurement; the rich golden-yellow colour of the variety is most lovely. Before the recent importations of *O. varicosum*, this variety was very scarce. I have seen it grown in Teak baskets with 160 flowers on a spike. It may be asserted that all the *Oncidium*s succeed better in baskets than in pots.

The dwarf growing *Cattleyas* were particularly attractive, the best of them being some *C. marginata* of extra fine form. They vary much in colour and still more in the size of the flowers. One very richly coloured variety had flowers 4 inches across. In this variety the maroon-purple lip, with narrow white margin, affords a striking contrast to the pale rosy-purple sepals.

Another of the dwarf-growing type, with a distinct and lovely flower, is *C. dolosa*, with rosy-purple sepals and petals, and a much deeper tinted lip. *Lelia Dayana* was also in flower, and is the deepest coloured one of all; the lip is rich purplish-maroon. A rather taller growing variety than any of the above was also in flower, *L. Dormaniana*, this is quite distinct from any of the above although it may well be associated with them. It is supposed to be a natural hybrid, between *Cattleya bicolor* and *Lelia pumila*. The sepals are olive-green with dark spots, the lip rich maroon-crimson. All these dwarf-growing species do well in small baskets suspended from the roof, in which position they do not shade the plants below much, as their growths are small. The gorgeous *Cattleya Dowiana* was also in flower. This species is easily grown in the warm *Cattleya*-house, the only difficulty is in learning the knack of putting it to rest. The plants have such an obstinate tendency to start into growth as soon as the flowers fade, or even before, when it is better they should not so do until they have taken at least three to four months' rest. Keeping the plants as dry and cool as possible is the only way to prevent it. Several plants of *Cattleya maxima* were furnished with flower-spikes. This is one of the most distinct and beautiful of all the *Cattleyas*, but few growers succeed with it. The right way to treat all these shy-flowering species is to place them close to the glass when they are making their growth, and afford them a decided season of rest and a season of growth. This may be ascertained as much by the active or quiescent state of the roots as by the appearance of the plants. Here is a fine group of *Lycaste Skinneri* alba, some four or five plants of distinct varieties in it in flower. They have pure white flowers, all of them, but differ in the form and in the density of colour of the yellow blotch on lip. Another lovely variety of *L. Skinneri* is in flower. The persistent character of this *Orchid*, and its easy culture, are strong recommendations in its favour. If those who have not succeeded with it would try leaf-mould in the compost, and a little very weak manure-water, when the plants are making their growth, they would probably have to note an improvement in the look of them. The quaint-looking *Catasetum Christianyanum*, with its dark brown sepals and petals, the greenish lip, and singular profile, *Vanda Sanderiana* and many forms of *Cypripedium Spicerianum* were in flower in the warmest house.

The *Cool House* were not so plentifully furnished with flowers, but some few striking examples were noticeable, especially fine being *Odontoglossum Inseleyi* splendens, well furnished with flowers 4 inches across, on two strong spikes. *Cymbidium giganteum*, a good old variety of very strong growth, was in flower; this species is well worth growing, if the houses are large, but it would be out of place in a small house. *Lycaste caudata*, far inferior to the

white variety of Skinneri, was producing many of its much smaller flowers, which have greenish sepals and white petals. J. D.

THE BULB GARDEN.

NEW VARIETIES OF HYACINTHS.

IN recommending varieties of Hyacinths we have learned to be very cautious, because tastes differ. Most people think the largest bulbs produce the largest spikes. This notion is quite wrong. There is, for instance, Norma (single pink), one of the largest bulbs, but which has a spike of inferior size; and on the other side there is Souvenir de T. H. Veen (single dark blue-purple), one of the best varieties in its colour, producing a small bulb, and yet the spike is extra-

double one where two spikes are united together, imitating a single truss.

As to the choice of varieties we quite agree, but advise our correspondent to try another year a few varieties, seedlings of later years, such as Electra, a very pale blue, and the largest flower amongst all colours. When this variety was for the first time shown to us we counted 131 bells on the spike. We may also recommend him to try the Sultan, a very dark purple variety with a dwarf habit and pyramidal form, and Princess Louise, double, dark red, with beautiful large, flat bells, and for a double variety producing an exceptionally large truss. J. H. Kerstein & Co., Florists and Seedsmen, Haarlem.

ONCIDIUM SERRATUM.

THAT there is a close relation between flower-buds and leaf-buds is known to every botanist. When a

double one where two spikes are united together, imitating a single truss. As to the choice of varieties we quite agree, but advise our correspondent to try another year a few varieties, seedlings of later years, such as Electra, a very pale blue, and the largest flower amongst all colours. When this variety was for the first time shown to us we counted 131 bells on the spike. We may also recommend him to try the Sultan, a very dark purple variety with a dwarf habit and pyramidal form, and Princess Louise, double, dark red, with beautiful large, flat bells, and for a double variety producing an exceptionally large truss. J. H. Kerstein & Co., Florists and Seedsmen, Haarlem.

imbriated, and the result of the investigation has been to fully confirm the previous opinion which I held and expressed. In my somewhat long experience I have found many specimen Conifers suffering from causes which are, if understood, perfectly under control, and if more care were taken by those in charge, be they gardeners, foresters, or amateurs, we should have a much finer display of these ornamental trees. As it is, they are too often miserable specimens only of a magnificent family.

To obtain this success attention is needed in the smallest details and from the very earliest stages. It is seldom that a drooping and suffering specimen can be reanimated, and perfect symmetry and beauty can only be obtained when care is taken in the selection of the plant, the selection of the soil and site, and in the after treatment. It is the common practice to plant these trees and then to leave them

FIG. 121.—CRATAEGUS PINNATIFIDA VAR. MAJOR. (SEE P. 621.)

ordinarily large. In the *Gardeners' Chronicle* of the 6th inst. we find this variety marked as too popular, and the bulbs miserably small. We are sorry to differ from that opinion, as it was only in 1883 that this was exhibited as a new variety by Messrs. James Veitch & Sons at the Royal Horticultural and Royal Botanic Societies, and it was duly Certificated at both places not so long ago. That it cannot have become popular—and in no case too popular—we feel sure.

We quite agree with the writer, if this variety made a better bulb it would be a great advantage for the future demand for it; but we protest against the wrong practice of selecting only the large bulbs, making the best varieties to grow for show or for potting purposes. This variety never produces a large bulb, and even in potting for show purposes we take care to pick out the smaller ones of this sort, as from our experience we are more certain to have one single truss, and this we prefer to a

student of plants sees the flower stalk of a *Fourcroya* covered with little green buds instead of flowers he is not astonished beyond measure, and so the appearance of leaf-buds on the branching raceme of *Oncidium serratum*, or on the inflorescence of a *Phalenopsis*, is regarded as an unusual but not as a very marvellous circumstance.

In some cases this production of leaf-buds might be advantageous for propagating purposes. Our illustration (fig. 122) shows a portion of such inflorescence much reduced. It was kindly sent us by Mr. H. James, of Norwood.

TREES AND SHRUBS.

A POST MORTEM ON AN ARAUCARIA IMBRICATA (CHILI PINE).

I HAVE been recently called in to investigate the cause of death in a fine specimen of the *Araucaria*

uncared for, upon the supposition that Nature will do the rest; but there can be no more vain delusion than this. These trees require during their growth constant and liberal feeding, and in dry situations mulching, so that sufficient moisture may be retained and keep the fine root-fibres near the surface. The soil, too, must be drained, as this special species will not live long where there is a cold and retentive subsoil.

If such a well-selected specimen is planted and cared for during growth, the probability is that a fine tree will be obtained which will be a pleasure instead of an eyesore, "a thing of beauty" in fact, and a "joy for ever."

If, on the other hand, it is neglected, and in after years steps are taken to reinvigorate it, they will probably fail, even if wisely and scientifically carried out.

I have always held these views, and therefore was glad of the opportunity which offered to confirm them

It is seldom such occurs, as few are disposed to grub up a tree which still shows signs of life, but which nevertheless promises no attribute of beauty.

The tree in question was planted in the year 1851, and had developed into a symmetrical and really beautiful specimen. About four years ago it showed signs of distress, in the lower branches, and gumming set in. An effort was made by those in charge to check this by the application of pitch to the cancerous spot and by top-dressing, but without avail. The disease gradually increased and with greater celerity towards the end. It was evident that the tree no longer obtained nourishment from the roots, and was living only on its own inherent sap. Strange to say, this continued for over a year, and when the tree was felled, or rather grubbed up, the top was still alive and vigorous, the roots and the stem being not only dead but rotten.

The opinion I expressed was that the tree had thrown down a tap-root into a cold and wet subsoil, and also lacked nourishment at the surface. The latter case I did not place much importance upon, for having lived so long there was no reason why it should not have continued in health had not the

which I have to some extent expressed already:— This tree, and most Conifers, will not thrive on un-drained land, where the subsoil is wet and retentive. To reach perfection the soil should be a porous, friable loam, and if not so naturally artificial means should be taken to render it so. The tree by top-dressing at reasonable intervals, and by keeping the surface open, *i. e.* free from turf, should be induced to keep its roots and root fibre near the surface. As time goes on, a trench should be dug 2 feet deep round the tree, 6, 8, or 10 feet from the stem, according to size and age of the tree, and filled with new mould, enriched with a compost of leaves and well-rotted dung. In hot, dry weather the soil for some space round should be well covered with dead leaves or cut grass, so as to prevent too rapid evaporation. A good plan, too, and one that I believe would amply repay the trouble and expense, would be to plant the tree on a base of concrete about 2 feet in diameter; and further, I would plant the tree entirely in new soil, using none that was taken out. When trees of this sort are planted, the invariable object is to obtain a beautiful effect, and therefore no expense or trouble should be spared. *C. E. Curtis.*

to be of larger size than in many species; it is for the fruit, however, that this plant will be valued, as the berries are of larger size in this variety than those of any other (see fig. 121) in cultivation, and of a fine bright red colour.

There would appear to be two forms of *Cratægus pinnatifida*, only differing, so far as I can tell, in the size of the fruit; one of them has small fruit about the size of that of the common Hawthorn or a little larger. This I take to be the typical form described by Bunge; the second form has large fruit, about three-quarters of an inch in diameter—this is Mr. Veitch's plant, and I propose to distinguish it by the varietal name *major*. The leaves of the typical form are often smaller, the lobes narrower, more acute, and frequently cut nearly down to the midrib; but sometimes the leaves are as large and in every respect the same as those of var. *major*, so that I am led to conclude that this is merely the effect of the different amount of nourishment received by the plants.

The variety *major* I suspect to be a cultivated state of the plant, as its large fruit is used to make jam and jellies, and on the label of one specimen, collected by Dr. Bretschneider, it is stated to be cultivated; another specimen of it, however, collected by Mr. J. Ross, has the following note on the label:—"Fruit of this wild Thorn grows as large as a Plum, acid-sweet, and much used for preserves." Both forms are natives of North America.

The fruits of Messrs. Veitch's plant are Pear-shaped, and this seems to be somewhat the form of the fruit of the dried specimens I have seen; but Koch states that the fruits are either globose or Pear-shaped.

The following are briefly the characters of *Cratægus pinnatifida* var. *major*:—A tree with deciduous leaves, stipules large, falcate, acute, toothed, petioles $\frac{1}{2}$ —2 inches long, blade of the leaf 2—3 inches long, pinnatifid, cut from one-third to one-half way down to the midrib into two to four pairs of broad, oblong, obtuse or acute lobes, with serrate margins; peduncles two to four flowered, clustered in terminal corymbs, 2—3 inches in diameter; flowers white, about three quarters of an inch in diameter; fruit Pear-shaped, an inch long and three quarters of an inch thick, bright scarlet-red [dull crimson?]; the eye is open and very deeply sunken, being one-third of an inch in depth. It is well distinguished from all other species of *Cratægus* by the long petioles of the leaves, and very large fruit with very deeply sunken eye. *N. E. Brown, Herbarium, Kew.* [This is the plant, specimens of which were lately shown by Messrs. Veitch under the name of *C. tartarica*. ED.]

CRATÆGUS LEEIANA.—When looking through a nursery at Downham Market, Norfolk, in October last, I observed a large Hawthorn tree full of clusters of big red berries, which I was informed was *C. Leeiana*. A beautiful ornament to the garden in autumn should not go unnoticed by planters. The Cockspur Thorn when full of its lovely red berries is very beautiful, but the subject of this note is even more so, being brighter in the colour of the berries. *P. C.*

FIG. 122.—PROLIFIC ONCIDIUM: LEAF-BUDS PRODUCED IN PLACE OF FLOWERS. (SEE P. 620.)

tap-root assisted itself from lack of vigour in the lateral roots. On investigation, I found that the upper soil to the depth of about 2 feet was perfectly dry, so dry as to leave one in wonder as to where the nourishment had come from for so long. The roots in this had spread and were well developed, and at one time had evidently possessed much vigour, but were then dead. Digging deeper this came out like a tooth, and it is not a hyperbolic expression to say that it was dripping with moisture. The resistance it had met with had deprived it of its outer skin and left it perfectly white, which in itself proves the moist state of the subsoil. The root was fully 3 feet long.

The soil was a wet sour clay, containing veins of sand and gravel, such as is found more or less throughout the soils of the London and plastic clays, and when it is remembered that on the surface above this there was absolute dryness, it becomes a wonder how the tree had so long found nourishment.

It should be mentioned that gumming had by this time spread over the whole tree. On sawing through the trunk the timber was found soft and fibrous; and even if in health it would not have shown signs of value. I gathered from this investigation the following important facts, and from them have formed the opinions

THE COLORADO SPRUCE.

Under this name is designated the very beautiful blue Spruce, *Abies* (or *Picea*) *pengens*, the glaucous form of which was at one time called *Parryana* glauca. It appears from the collectors' notes that the seedlings from the same tree are of all shades, from very blue to dark green, so that it is necessary to select the best, and these naturally command a higher price than the green ones. The tree is quite hardy, and endures the most severe prairie winds at 40° below zero. There is a beautiful plant of this in Mr. Anthony Waterer's nursery at Knapp Hill. We do not know at present what soil suits it best, but we can testify that both the green and the glaucous variety do well as young plants on cold, stiff, wet clay.

CRATÆGUS PINNATIFIDA (Bunge) VAR. MAJOR, *N. E. Brown, n. var.**

This is an exceedingly ornamental Hawthorn, of which I have received good fruiting specimens from Messrs. Veitch & Sons, who introduced it from Tartary some years ago. Its flowers in a fresh state I have not seen, but the dried specimens show them

* *Cratægus pinnatifida*, Bunge, in *St. Petersburg Mem. Societas Entom.* 1831, vol. ii., p. 100; *Trans. Russian Hort. Soc.*, 1852, t. 22; Regel, *Gartenflora*, t. 306. *Mespilus pinnatifida*, Koch, *Diand.*, vol. i., p. 152.

TRADE NOTICES.

ORCHIDS AT MR. WM. BULL'S.

No better answer could be given to those who say that Orchids cannot be grown to perfection in the neighbourhood of large towns, than by pointing to the extensive and healthy collection at this establishment. As we pass through house after house filled not only with large quantities of those showy things which are in general demand, but also with a great variety of rare and curious plants not generally met with, and many of them very difficult to cultivate, we find them all in the best condition possible, clean, sound, and well-rooted; indeed, it is difficult to imagine plants more vigorous than those contained in Mr. Bull's collection, and especially in the large *Catleya*-house, and that containing the many hundreds of fine specimens of *Odonatoglossum vexillarium*, and *Oncidium macranthum*, which most growers would find it difficult to surpass even when their plants are grown in the most favourable and open parts of the country. In town the skill of the grower is no doubt taxed to the utmost, but nevertheless of all plants the Orchids seem to be the least particular as to locality.

In the *Catleya*-house, which also contains the larger *Lælia*, *L. Perrinii*, that useful November flower, still makes a show with some of the varieties

of *L. elegans*, of which *L. e. Mastersiana*, with its white sepals and petals and broadly expanded crimson lip, proves its superiority over the varieties of *L. e. Schilleriana*, and *L. e. alba* near by; the *L. accepta* too, of which there are many superb white varieties here, are coming in, among those prominent in bud being *L. a. Dawsoni*, *L. a. alba*, *L. a. venusta* and *L. a. Hillii*. Among the *Cattleyas* the *C. Trianae* are well furnished with rising buds, the fine varieties *C. T. princeps*, a very massive dark crimson-tipped variety; *C. T. virginale*, the finest white; *C. T. Imperator*, an improvement on *Russelliana*; *C. T. Victoria*, with white sepals and petals and crimson lip; and *C. T. tyrianthina*, a rich medium-sized flower, being well advanced. The *C. Mendii* and *C. Skinneri* are well furnished with flower-sheaths, the latter especially so; and the *Laelia purpurata*, of which some grand masses of the true old type are here, are equally well set for flower.

In this house a number of plants of *Angreecum sesquipedale* are always to be found in good condition, and the fact is worth recording, as some think it will not grow with *Cattleyas*. Some *Aerides*, *Cattleya aurea*, and *Ansellia africana* are also in bloom. In the vexillarium-house before alluded to is a fine lot of specimens of *Odontoglossum Phalenopsis*, a large lot of *Pilumna fragrans* and *P. nobilis* in bud; and in flower some fine sprays of *Oncidium varicosum*, *Masdevallia tovarensis*, *Vanda cœrulea*, *Odontoglossum cerosum*, and a number of varieties of *Lycaste Skinneri*, including five of the best varieties of the pure white *L. S. alba*, one of them having five flowers open—a superb plant.

In the next two warm houses we found in flower *Trichostema albo-purpureum*, *Cattleya superba*, many examples of *Oncidium Kramerii*, *O. pumilum*, *Aerides Lawrencei*, a fine lot of *Odontoglossum Roezlii*, including the pure white and the dark violet-marked form, called *negrum*; *Cyrtopidium Lawrenceum*, some of them superb forms; *C. selligerum*, *C. concolor* *Regneri*, *C. Spicatum*, *C. Godfreyæ*, *C. barbatum hillorum*, *C. barbatum pulcherrimum*, the scarlet *Habenaria militaris*, *Poly-stachya hypocratica*, *Angreecum Leonii*, *A. citratum* (numbers showing flower), *Warrea tricolor*, *Houlletia odoratissima*, *Lycaste plana alba*, *L. Burringtoni*, *Calanthe Mylani*, *C. veratrifolia*, *Phalenopsis Stuartiana*; a pretty group of *Cattleya leucola*, another of the blue *Tillandsia Lindenii vera*, and a robustly grown batch of the true white *Ceogyne cristata hebeleuca* or *alba* with strong flowering growths.

The intermediate-houses have a good show of bloom, in which the quantities of *Oncidium tigrinum* and *O. pretectum* are prominent; with them are well-flowered plants of *Miltonia Moreliana*, *M. spectabile bicolor* (just over), *M. candida*, *Oncidium cheiroporum*, *O. unguiculatum*, *Cyrtopidium Schlimii*, *Odontoglossum cariniferum*, *O. ramosissimum*, *Laelia pumila*, *Ceogyne ocellata* and *C. ocellata maxima*, which latter is twice the size of the former; *C. Massangeana*, *Dendrochilum Cobbianum giganteum*, a fine and fragrant plant—the best of the *Dendrochilums*; and a glowing scarlet group of the best strain of *Sophrontium grandiflora*, which cannot be overrated as a charming winter flower.

The occupants of the cool-houses again call for remark as to their vigour, the long house of *Odontoglossum Alexandræ* and its hybrids, and the others filled with *Masdevallias*, &c., being up to their very best. Few collections can boast such a large quantity of fine (44 specimens of *O. Alexandræ* and *O. Pescatorei* as this, some of the plants having been grown on here from the earliest importations, and many of them are large established plants. The advantage of these strong bottoms is seen in the strength of the flower-spikes and the size of the flowers of such of them as are in bloom. Besides the white flowered *Odontoglossums* in bloom is a neat group of *O. Rossi majus*, several of the true *O. Insejaj leopardinum* and *O. I. splendens*, some *O. grande* and *O. Uro-Skinneri*, a dozen or so well-flowered plants of the pretty and delightfully fragrant *Trichostema suavis*, *Pleuronthallis Barberina*, *P. velaticalis*, *Epidendrum vitellium majus*, *Sophrontium cerosum*, some *Mesaspisidium vulcanicum*, very useful for its bright magenta-crimson colour; many varieties of *Masdevallia ignea*, also useful for their glowing orange-scarlet tints; *M. Wallisii*, *M. perisieria*, *M. Veitchii*.

The approach to the older houses, through the conservatory filled with Palms and Tree Ferns,

and now brightened with *Chrysanthemums*, is well worth lingering in. The houses then elves contain *Vandas*, the *Cymbidiums*, and others, mostly of the stronger growing kinds, all the plants being clean and healthy, and most of the houses have some flower. In going round we noted in bloom good batches of *Oncidium Papilio* and *O. Kramerii*, *Phalenopsis Esmeralda* and *P. amabilis*, *Vanda suavis*, and in the same house a grand lot of *Chaetochrysa* and other varieties of *Ceogyne cristata*; several *Cymbidium Mastelii*, a lovely white winter flower; *Mixillaria grandiflora*, *Oncidium excavatum*, *Cyrtopidium Hynaldianum*, *C. Sedeni*, *C. insigne Chantini*, and *C. insigne var. maculata*, a form intermediate between *C. i. Chantini* and *C. i. var. albo-marginata*; several of the fragrant, clear yellow *Mormodes pa-dinum unicolor*, *Dendrobium Higginbum*, and the first *D. Wardianum* we have seen this season.

We were also tempted into the new plant houses, but as space will not allow our even attempting a passing notice of the many handsome things contained therein, we content ourselves by reiterating the opinion we have formerly expressed respecting the rich and brilliant crimson-scarlet *Impatiens Hawkerii*, and the lovely *Aristolochia elegans*, which appear to be two of the most acceptable and generally useful plants of recent introduction.

CHRYSANTHEMUMS AT MESSRS. VEITCH & SONS.

The sections of this group grown here are mainly the Japanese and the incurved, with another non-descript class, for which a denomination is wanted—we allude to hybrids of Japanese and incurved varieties, that possess the characteristics of each. The plants are dwarfier than we have noted them in former seasons, and are well furnished with foliage and flower.

A large span-house was set apart for the principal exhibition, and a line of plants stood right and left of the path in the Camellia corridor. Plants of 1885 noted were *Rosy Morn*, a flesh-coloured reflexed variety; *Malame Melanle Fabre*, light rose, and very pretty; *Stevens' Maiden's Blush*, almost too white to be called by such a name; *Bias Rouge*, a flower of deep crimson and golden-centred florets; *Souvenir d'Harlem*, Mrs. Horsfield, a large blush incurved, like *Globe* in form, from which it is a sport; *Fleur de Brûis*, a deep chestnut-brown, with well reflexed florets, and Mrs. J. Living. The plants of 1886 observed in bloom in the larger collection, and which possessed in most instances well-grown flowers, were *Mons. H. Elliott*, a bright coppery Japanese; *M. Paul de Tours*, a reflexed flower, large, white, with flesh tipped florets; *Malame la Marquise de Mui*, a lilac reflexed Japanese, very pretty; *Mad. Mathisson*—a fine white Japanese, of much substance that will make a good show flower; *Ob-nant*, of rich chestnut-red, a Japanese; *Souvenir d'Angeli Amiel*, of the same class, a good thing in white; *Butternut*, previously mentioned amongst certificated flowers of the year, a rich pure yellow; *Mr. T. S. Ware*, with terete florets, standing out at right angles to the centre, giving it a starry not unpleasing appearance; *Salmones plena*, salmon-pink; *Ruy Blas*, a golden-brown Japanese with florets yellow tipped; *Jupiter*, a bright crimson with gold tipped florets—a well reflexed Japanese; and another of this section is *White Ceres* with semi-terete florets; *Mrs. G. Welton*, a mauve-coloured flower, pretty and full, with florets like those of *Gaillardia Lorenziana*, making this a very distinct variety; *Lady Roselery*, of beautiful pale rose, also of the Japanese class; and a white sport from *Mad. C. Audiguer*, similar to that in all respects but colour. Two new ones of Mr. Salter's raising—*Irene*, a white flower, and *Janira*, of a deep magenta colour, both reflexed Japanese—are desirable sorts. The brilliant golden *Phoenix*, a plant sent out in 1885, was noted in fine flower, as well as many others that are now well known to *Chrysanthemum* growers.

THE ALLUVIAL MANURE COMPANY.

Two samples of the portable manure manufactured by the above company (Market Buildings, 26, Mark Lane, E.C.) have been forwarded to us, which seem to be in an easily applied form. Of the value of the manures we cannot speak, nothing but comparative trials being of any use in testing such materials. We think it is most essential to state the maximum quantity per square rod or acre that should be applied, otherwise serious losses can ensue.

FORESTRY.

NOTES FROM THE COLONIAL EXHIBITION: THE CANADIAN COURT.

(Continued from p. 530.)

THE TULIP TREE.—Amongst the several examples of hardwood timber exhibited, and such as are of particular interest to the British public are: The Tulip tree (*Liriodendron tulipifera*), the Butternut (*Juglans cinerea*), the white Birch (*Betula alba*), the American Chestnut (*Castanea vulgaris*), and the black Cherry (*Prunus serotina*).

Judging from the specimens of the Tulip tree wood here shown one would be led to form a very decided opinion not only of its beauty for the cabinet-maker, but from its firm close-grained texture that its durability would be great. It is very pretty in appearance, remarkably elastic or easily bent, close grained, and lasting, and from which good qualities it is largely used for the finer classes of furniture, for fancy articles, such as desks, boxes, &c., while for panelling and interior work generally it is always used where procurable. From the numbers of fine trees of the *Liriodendron* growing in this country their rapid growth and indifference to any particular soil, combined with the valuable qualities of the wood produced in its native country, should be a warning to us English to plant more extensively than we have hitherto done, so ornamental as well as useful a timber-producing tree. The cost of young Tulip trees, fit for immediate planting is not by any means exorbitant, for if taken in quantity, we find that they may be purchased from some of our home nurseries at the trifling cost of rather less than 6s. each.

THE CHESTNUT.

Between the wood of the American Chestnut and that of the best quality produced in this country, I could detect but little difference, indeed I am now inclined to believe from the results of a chat over the matter with a Canadian friend, that our own is the superior. That produced in Canada is usually coarse-grained, but in appearance little different from our own, always very durable, but everywhere difficult to season so as to prevent warping, when converted into boards. It is extensively used for cabinet-work, for railway purposes, and, hereabouts at least, in the making of collars. For this latter purpose it is in great demand in Wales, and not unfrequently substitutes Oak, though the expense in connection with timber and workmanship are but little different.

CHERRY WOOD,

of which two kinds are exhibited, looked much like that of our native *Gean tree*, being of a light yellowish-red colour, susceptible, from its firm texture, of a fine polish, easily worked, and free from warping. Being rather scarce the wood of the Cherry is rarely seen in use, although in the more expensive class of furniture it is frequently employed. The prettiest and evidently the most useful of the Canadian kinds was *Prunus serotina*, or, as it is usually called, the *Waney Cherry*.

THE BUTTERNUT

is, when grown in this country, as well, indeed, as in its Canadian home, a very ornamental as likewise useful timber-producer, although in this respect it is far behind the black Walnut (*Juglans nigra*), a tree now so commonly cultivated in our own country. For wainscoting, cabinet-making, and various other uses, the wood of the Butternut is still in demand, but not nearly so much as in the black form.

This latter is now getting extremely scarce, and sells at a high price in most countries, and it is no uncommon thing to see bands of men going about in various parts of America, where this tree was once fairly abundant, grubbing up the gnarled and twisted roots and stumps for veneering purposes.

For the War Department of this country we annually import large quantities of Walnut timber from the Continent, but it is to be hoped that warnings issued long ago will have caused considerable tracts of this tree to be planted, and so lessen, in years to come, foreign importations. We might here advise intending planters of the Walnut not to do so unless in ground of fairly good quality, else failure and not success will own the effort.

Dampish loam of the very best quality produces the finest Walnut timber, this no doubt, having much to do with the present scarcity of the tree. *A. D. Webster.*

(To be continued.)

The Flower Garden.

PLANTING TREES AND SHRUBS.

THE planting of deciduous trees and shrubs should now engage attention; choose dry weather for the operation, for if the soil clings to the spade and feet it is not in proper order for working. Avoid deluging the soil after planting at this season, it is both unnecessary and detrimental to plants in the open ground. Rhododendrons will not thrive on some soils, and special provision has to be made for them. Wherever chalk and lime abound it is useless to attempt growing these plants without peat and leaf-mould; they will, however, succeed in most loamy, sandy soils that are free from these, if a liberal addition of leaf soil be mixed with the staple. In unsuitable soils it is best to elevate the peat beds considerably above the ground level, and afford ample drainage for the escape of water; as this, when it passes over chalk soil, contains a proportion of lime in suspension. Any ornamental trees and shrubs which are not growing satisfactorily may be improved by cutting a trench 2 to 3 feet wide round them at the extremity of the branches, removing the bad soil to the depth of 2 feet, loosening the subsoil to the depth of a foot and leaving it loose. Fill up with good soil, or a liberal top-dressing may be given by picking the soil with a steel fork from the top of the roots and clearing it away, and then adding a foot of good rich soil; but preference should be given to the former method, as the roots find ready access to the fresh compost, and however carefully the operation of removing the old soil from the top may be carried out, a certain amount of injury is sure to be done to the roots, besides they do not benefit to the same extent as by the former method.

COLD PITS.

Auriculas.—These must be constantly examined to see that they are not suffering from damp; alpine plants being generally impatient of any stagnation or excess of moisture.

Carnations and *Pinks* should have all the decayed leaves removed. Embrace the opportunity of every sunny breezy day, when the wind is not very cold, to remove the sashes wholly from the foregoing, in order to dry up all superabundant moisture; the hardy subjects sustain far less injury from a few degrees of frost than from damp. On dull days, when there is no fog, the sashes may be raised above the framing altogether, by laying a piece of lath at the top and one at the bottom on the framing, and placing the sashes on the top; this is preferable to simply lifting the sashes at the back.

HERBACEOUS BORDERS.

These should now be cleared of dead flower-stalks, which should not be cut too close to the ground, as during the winter they gather amongst them fallen leaves, which afford protection from frost, as well as ward off heavy rains, especially valuable in the case of Lilies. It is also a good time to transplant herbaceous plants, and also to arrange the borders, as the hardy bulbs are in a dormant state, and less injury is done to the roots. Let the borders be well manured and trenched previous to replanting. *H. M. Baillie, Luton Hoop Gardens.*

PLANTS AND THEIR CULTURE.

THE STOVE.

IN most plant stoves a miscellaneous collection of stove plants is grown, some requiring to be resting, others not, while a portion may still be flowering; it then becomes a difficult matter to manage and keep the whole in a healthy state. *Clerodendrons*, *Douglasvilleas*, *Allamandas*, *Aristolochias*, and other plants that are partially deciduous and of a twining nature will take no harm by being kept without water for several weeks; so may also *Hoyas*, *Combretnums*, *Mediolias*, *Stephanotis* be kept dry for a time and it will not hurt them if the leaves droop and get a little flaccid. If a larger number of plants be grown than can be accommodated with good positions in the house, the earliest flowering ones may be cut down and placed in less prominent places, when they will supply a quantity of cuttings at an early date, then the old plants may be thrown away. As soon as the early bloomed plants are out of flower other plants should be put in the vacated

places. When the *Gardenias* are about to burst their buds a little bottom-heat will assist them in producing flowers. *Gardenias* should now be brought on in a brisk heat of 70° for later flowering, keeping the plants as near the glass as possible; *G. intermedia* is much the best variety for general purposes. The plants of *Eucharis amazonica* which were put into heat early last month should now be throwing up a fine lot of bloom. A successional lot of plants which have undergone a moderate rest, if put in the forcing-house, will result in a fine show of bloom at Christmas. *Bouvardias* of the single and double kinds should now be in full bloom; keep them as near to the glass as possible without actually touching it. To have these to flower freely through the winter they must have a high temperature, and be occasionally watered with manure-water. *Cactus* and *Epiphyllums* that made their growth early will now be showing flowers, and should be kept in a light position; they should come on slowly. *Aphelandras* deserve to be grown generally, as during the next month they are the most showy of plants; they are of little use for cutting, but that is not a misfortune, as they continue to expand fresh flowers for many weeks if the heads are left on the plants. *A. Evansi, Lythe Hill, Haslemere.*

FRUITS UNDER GLASS.

FIG-HOUSES.

THE trees in these structures should be got in readiness for forcing without delay, beginning with the trees in the earliest house, and finishing with those in the latest. In pruning the trees cut out as many of last year's shoots as will make room for a like number of those of this year's growth being retained to cover the wall or trellis at 6 inches apart, selecting, of course, for this purpose those shoots which are best furnished with embryo fruits. Care must be taken in washing the shoots with a soft brush and soft-soapy water not to injure these in doing so. The interior of the Fig-house should be cleaned in the way recommended for Peach-houses, and the same remark applies to the surface-dressing of the border. In many places the early crop of Figs is secured from plants grown in pots plunged in a bed of fermenting leaves in a forcing-pit, in which case the surface soil to the depth of 2 or 3 inches should be removed, and be replaced with some of the same description as that recommended for top-dressing Peach borders, prior to plunging the pots, when sufficient tepid water to thoroughly moisten the ball of earth and roots should be given to each plant. Aim at a night temperature of from 50° to 55°, 5° or 10° higher by day with fire-heat, and 10° higher by sun-heat. Damp the trees more or less, morning and afternoon, on bright days. *H. W. Ward, Longford Castle.*

HARDY FRUIT GARDEN.

PLANTING, AND SEEDS TO PLANT (Continued).

Apricots.—These to be a success should be planted on walls having a south or western aspect, the trees being well protected by blinds, or some other substitute, when in bloom, until a good set of fruit has been secured, and the foliage has grown sufficiently to shelter the young fruits; good varieties are *Frogmore Early*, *Hemskirk*, *Large Early*, *Moor Park*, *Royal*, and *Surrell's Late*.

Cherries.—In woodland districts it is impossible, without the protection of netting, to preserve the fruit upon the trees until thoroughly ripe. As the trees accommodate themselves to any situation or aspect, providing they are planted in a good soil, they will repay some space on the cooler aspects of walls, or the erection of a trellis, where the trees can be easily netted over when the fruit commences to change colour. Fine varieties are *Belle d'Orleans*, *Frogmore Early*, *Governor Wood*, *Early Rivers*, *Warder's Early Black*, *Kentish Bigarreau*, *Black Eagle*, *Bigarreau Napoleon*, *Black Circassian*, and *Morello*.

Currents worth cultivation are, *Red Dutch* and *Ruby Castle*; white varieties, *Cut-leaved White Dutch* and *Transparent White*; black varieties, *Baldwin's Black* and *Lee's Frolic*.

Figs.—It is useless to attempt the cultivation of these out-of-doors unless in the most favourable

aspects, and in well-drained and naturally warm soil. The following varieties are the best:—*Brown Turkey*, *Brunswick*; and *Broughton Place* is also said to be a good one out-of-doors.

Gooseberries.—Although not much appreciated by many on the dessert-table, some of the large Lancashire berries, when eaten just at the right time, are most refreshing. The worst part of this class of Gooseberries is that most of the bushes of the best varieties have such a trailing habit of growth, necessitating their growth on long stems, if of the bush shape, or on trellises or walls. Purchasers wishing to grow these as ordinary bushes would do well to pay a visit to the nursery, if not acquainted with the individual varieties, and select those of upright growth. The straggling sorts do very well tied to stakes like pillar roses.

Nettles.—As in the case of Peaches, some of the varieties are subject to mildew, and are also too tender for profitable outdoor cultivation. The following varieties do well here:—*Elrage*, *Hardwick Seedling*, *Violette Hative*, and *Lord Napier* for a first early.

Peaches.—A good selection for succession:—*Alexander*, *Early Louise*, *Early Alfred*, *Royal George*, *Dymond*, *Violette Hative*, and *Walburton Admirable*; *Violette Hative* and *Dymond* are the best for extensive planting.

Plums.—Culinary sorts of good quality are *Rivers' Early Prolific*, *The Czar*, *Victoria*, *Mitchelson's*, *Belgian Purple*, *Pond's Seedling*, *Diamond*, *The Fairleigh Prolific*, *Damson*, *Wyddale*, *Belle du Septembre*, and *Grand Duke*. Dessert:—*July Green*, *Gage*, *Dunison's Superb*, *Transparent Gage*, *Green Gage*, *Jellerson's*, *Kirke's*, *Washington*, *Reine Claude de Bay*, *Ice-cream Imperatrice*, and *Cox's Golden Drop*. The last-named should be planted extensively on different aspects. *G. H. Richards, Somerley, Ringwood.*

The Kitchen Garden.

GLOBE ARTICHOKE.

FOR protection some light material, such as bracken or straw litter, should be placed around the base of the plants, having first removed the old flower-stems, dead leaves, &c.

CAULIFLOWERS.

In cutting should be gone through every two or three days, and the leaves broken down over them as a protection against light sudden frosts, which are apt to discolour the flowers and render them unfit for use. In the event of anything like a severe frost setting in, all plants showing heads should be lifted with good balls attached to them, and planted in net-iron frames, where they can be effectually protected; further, all the more fully developed ones fit for consumption can be cut with most of their leaves and stem attached, and placed in a cool shed, or cellar, where they will remain fresh and fit for use for several weeks. Any that might possibly become withered or flabby should be immersed in water a few hours prior to being used. Young plants of these intended for spring work, either in frames or handlights, cannot be too much hardened, and should therefore be fully exposed, and have abundance of air at all times, excepting in frosty weather.

GENERAL WORK.

Any contemplated alterations or improvements in the shape of draining or otherwise should be carried out at once; all digging and trenching should be pushed on, the sites for the principal main crops of next season decided on, and the ground prepared accordingly, bearing in mind that, as a rule, all roots should be grown on ground deeply dug or trenched, and which has been manured for the previous crop, whilst for *Cauliflowers*, *Cabbage*, *Peas*, &c., it cannot be too heavily manured. In the frame ground, for hotbeds and other purposes, should be collected a good heap of fermenting material, consisting of leaves and stable litter; these, after being thrown together and mixed, can be occasionally turned over and thus rendered ready for use.

SALADS.

For this purpose sow *Mustard* and *Cress* in shallow boxes that can be easily moved, continue to bleach *Endive* and *Chicory*, and keep fall grown *Lettuces* in frames dry, with plenty of air. Any spare frames may still be utilised for planting late *Lettuce* and *Endive* in. Sow a few *Cucumber* seeds in small pots in heat, to raise young plants for very early planting, also another batch of *French Beans*.

POTATOS.

Where early varieties are grown in pots or boxes, some sets should be placed in shallow boxes, lightly covered with leaf-soil, and placed in heat to excite them to start previous to planting. *John Austin, 117, Wey Court.*

Appointments for the Ensuing Week.

SHOWS, &c.

MONDAY, Nov. 15.	{ Sheffield and Hallamshire Gardeners' Chrysanthemum (two days). Putney Chrysanthemum (two days). Southend do. (two days). Winchester do. (two days). Brighton do. (two days). Weyford do. (two days).
TUESDAY, Nov. 16.	{ Devices do., in aid of the Gardeners' Royal Benevolent Institution (two days). Teddington do. (two days). Twickenham do. (two days). Caterham Chrysanthemum. Ascot, Sunningdale, and District do. (two days).
WEDNESDAY, Nov. 17.	{ York do. (three days). Eristol do. (two days). Newport and County do. (two days). Royal Horticultural Society of Ireland Chrysanthemum. Hitchin do. Tunton do. Chiswick do. Hull and East Riding do. (two days). Wimbledon and District do.
THURSDAY, Nov. 18.	{ Sheffield and West Riding Chrysanthemum (two days). Pudsey Chrysanthemum. Ramsbottom Floral Society. Kettering Chrysanthemum.
FRIDAY, Nov. 19.	
SATURDAY, Nov. 20.	

SALES.

MONDAY, Nov. 15.	{ Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs and 3000 Lilium auratum Bulbs, at Frotheroe & Morris' Rooms. Sale of Nursery Stock, at Friggs' Nursery, Lewisham, by Frotheroe & Morris. Sale of Bulbs, Roses, &c., at the City Auction Rooms, Gracechurch Street, E.C., by Frotheroe & Morris.
TUESDAY, Nov. 16.	{ Sale of Nursery Stock, at Cooper's Hill Nursery, Frox, Chertsey, by Frotheroe & Morris. Sale of Nursery Stock, at Pennett's Nursery, Tottenham, by Frotheroe & Morris. Sale of Dutch Bulbs, Roses, Fruit Trees, and Border Plants, at Stevens' Rooms. Sale of Plants, at Frotheroe & Morris' Rooms. Sale of Greenhouse Plants, at the Nursery, Harold's Wood, by Frotheroe & Morris. Sale of Orchids in Flower and 5000 Lilium auratum from Japan, at Stevens' Rooms.
WEDNESDAY, Nov. 17.	{ Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Sale of Fruit Trees, Plants, and Stock, at Laxton's Nursery, Gifford, Sandy, Beds, by Frotheroe & Morris. Sale of Imported and Established Orchids, at Frotheroe & Morris' Rooms.
THURSDAY, Nov. 18.	{ Clearance Sale of Plants, &c., and Sale of the Lease, at Chesterman's Nursery, The Mead, Child's Hill, N.W., by Frotheroe & Morris. Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Sale of Dutch Bulbs, Roses, Fruit Trees, and Border Plants, at Stevens' Rooms.
FRIDAY, Nov. 19.	
SATURDAY, Nov. 20.	

Horticulture and the Colonial Exhibition.

THE close of the Colonial and Indian Exhibition, the most generally popular of a series in which all have been more or less successful, suggests some thoughts as to the relation of horticulture in general, and of the Royal Horticultural Society in particular, to these exhibitions. The first of the series—the Fisheries—had little direct relation to horticulture. The all-comprehensive Health Exhibition was more nearly concerned with our art, and from an educational point of view was probably the most important of the series. The Inventions Exhibition contributed but little to horticultural science or practice, or, to put it in the reverse way, horticulture contributed comparatively little to it. The Colonial Exhibition

was different. In that the practical relation of cultural arts and cultural science was more marked. No one can have visited the magnificent exhibits made by Canada, by India, and the various colonies without being impressed by the vastness of the interests with which horticulture, in a broad sense, has to do. The splendid series of timbers from all the colonies, the magnificent displays of cereals, of fruit, of food-products, of substances used in medicine and the arts, must have impressed the dullest with the importance of the practical application of botanical science. The welfare of the home country, the prosperity of the dependencies, was shown in the most conclusive manner possible to be bound up with the progress of botanical science and its applications. Even from the point of view of decorative horticulture—the most showy and the most popular, though intrinsically the least important of all—the show now closed has been most remarkable. Week after week the finest products of horticultural skill, the most remarkable examples of horticultural enterprise, have been put before the public.

We need not stay to mention in detail the persistent efforts of such men as Messrs. WARE and BARR, or the intermittent exertions of those who have contributed so much to the success of the fortnightly displays. Nor need we do more than mention the suggestive exhibits made from time to time by the various colonies. These have told their own tale. From the standpoint of pure science, again, much, very much has been done. To give one illustration only, we may allude to the geographical exhibits of the several courts—New Zealand, the Australian, and South African Colonies. In the conservatories attached to these colonies most instructive lessons in botanical geography have been offered to those who would or could take advantage of them. For many years this phase of the matter has been dealt with at Kew, and if, so far, we have not had a special geographical exhibit, such as that carried out with so much success at Copenhagen by Mr. HANSEN, we have at least had this year an exhibition which more than any other has shown the resources of our Colonies in the way of practical and decorative horticulture, an exhibition such as the world has never before seen.

The Royal Horticultural Society, the acknowledged representative of horticulture in this country, has, no doubt, done much, but we cannot say that it has risen to the level of the magnificent opportunities afforded to it. The Royal Horticultural Society undertook the preservation at Chiswick last winter of many of the plants exhibited. It had a large share in the arrangement of those courts which formed such delightful oases in the midst of the "dry goods stores," and specially it had the superintendence of that series of fortnightly exhibitions which most assuredly contributed so much to the enjoyment and instruction of the visitors. Our readers will know and will appreciate this, but the general public knows little of, and probably cares less for, the part played by the representative Society.

Here it is that the deficiencies of the Society become most apparent. With splendid opportunities it has done comparatively little to impress upon the public the vast importance of botanical science and its applications. Surely this Exhibition afforded an opportunity of demonstrating and driving home to public intelligence the enormous influence of horticulture, taken in its broadest sense, as a factor in the prosperity and welfare of nations. Those who know all the circumstances of the case will be the last to blame the Society, but they will necessarily be those who will the most regret its inability to thrust horticulture prominently before the public and show it in its true position as one of the very foremost factors

in developing the wealth and the physical and material welfare of the people. The show as a show left little or nothing to be desired from this point of view, the deficiency becomes apparent when we see how little was done to utilise the lessons afforded by the show. We learn much, very much, by the eye, but the eye requires to be awakened, and the intelligence requires to be awakened, so that the lessons put before the eye may be turned to good account. We cannot say that this has been done. Even the lectures and conferences which were held had comparatively little reference to the varied and multifarious influences of plant culture, and of the knowledge of plants.

It was a great show truly, but the showmen were neither numerous nor impressive. The literature of the Exhibition, excellent as it was in many ways, was defective from the point of view of horticulture. There has been no general statement of the principles of culture as affected by diversities of climate and controlled by special requirements; there has not been any general survey of the vast resources derived from the vegetable kingdom—such a survey as would naturally come within the purview of the Royal Horticultural Society. We should not have alluded to this matter were it not for the possibility that a portion at least of the present Exhibition will be continued next year. The feeling that a Colonial Institute of some kind should be the natural outcome of this Exhibition is, we believe, general. No one knows for certain, we believe, whether such an Institute will really take shape; no one knows for certain where, if at all, it will find a home; still less can any one forecast the future of the Royal Horticultural Society; but whatever be its fate, wherever its lot may be cast, it is, to our thinking, all-important that the vast importance of practical and scientific horticulture should be brought to the front. When we consider how vast are the interests concerned—nothing less than the supply of the largest share in the food, clothing, residence, and enjoyment of the human race in all climates and in all stages of civilisation—we must admit that the part at present taken in this vast work by the Royal Horticultural Society, and by its sister societies, is pitiful indeed. May the lessons of the Colonial and Indian Exhibition be taken deeply to heart for the profit and advantage of the people.

— THE "GARTENFLORA."—We are informed that this journal, so long edited by Dr. REGEL, and lately by Professor ENGLER and Herr STEIN, of Breslau, is to become the organ of the Verein zur Beförderung des Gartenbaues in d. K. Preussischen Staaten, and will be incorporated with the *Deutsche Garten Zeitung*, under the editorship of Professor WITTMACK. Drs. REGEL and ENGLER will still render assistance as contributors.

— CHRYSANTHEMUMS AT BEECHWOOD PARK, HERTFORDSHIRE.—Mr. GREENFIELD has again kindly consented to show his Chrysanthemums to the public during the ensuing week—15th to the 20th. The collection consists of the most beautiful varieties. Between 500 and 600 plants are grown, including a good number that are trained, which add very much to the interest in the collection.

— PIGEON POST.—M. ERNEST BERGMANN narrates that M. HOOBERNK, of Hietzing near Vienna, makes pigeons answer the purpose of the telegraph or telephone. Every morning the birds are taken from the suburban nursery into Vienna and if in the course of the day a demand arises for cut flowers or plants from the nursery, the pigeons are despatched with the message from the town. What a pity the pigeons cannot take back the plants too?

— THE AUSTRIAN SCHOOL OF HORTICULTURE.—M. ERNEST BERGMANN contributes to the *Journal de la Société Nationale d'Horticulture* an account of the Austrian Horticultural Society of Vienna. The most interesting part of M. BERG-

THE PHOTOGRAPH BY G. W. M. & CO., 11, MARK LANE, LONDON, E.C.

VIEW FROM THE GROUNDS OF ARDDARROCH.

MANN'S account is that which relates to the School of Horticulture established by the Viennese Society. The Society selects the Professors, and directs the course of education. The lectures go on from October to the end of February. They are entirely gratuitous, and are given in the evening, so that young gardeners may attend them. Eighteen hours weekly are allotted to the lectures. The subjects taught include general horticulture, fruit culture, drawing, landscape gardening, mathematics, botany, entomology, natural history, book-keeping, German. At the end of the season an examination is held, and certificates are awarded to the most praiseworthy students. The 1st prizes consist of a travelling allowance of 375 francs, so that the pupil may have the opportunity to learn something of foreign practice.

— "BOTANICAL MAGAZINE."—The November number contains coloured flowers of the following species:—

Streptocarpus Dunitii, Hook. f., t. 6903.—This is the truly extraordinary and by no means unattractive plant which we have had occasion to mention on several occasions, though we must take the opportunity of saying that the attribution of the species to Dr. MASTERS is an error. The notice of the plant was sent to us by a correspondent, and was not drawn up according to botanical canon, hence neither our correspondent nor ourselves can claim the sponsorship of the plant, which is described *scutellum artem.* and for the first time, by Sir JOSEPH HOOKER. The present plant, like some of its congeners, produces one leaf only, but this of a length of 36 inches in extreme cases, coarsely toothed and bullate like a Savoy Cabbage. By the side of this horizontally spreading leaf appears an erect panicle of very numerous dull pink flowers, each about 1½ inch long, with long, curved, funnel-shaped tube, and a short, 5-lobed limb with rounded lobes. The plant is a native of the mountains of the Transvaal, and may be seen in the Succulent-house at Kew, forming an edging to the quaint Caeli and Euphorbias with which it is associated in its native country. We repeat that this is one of the most extraordinary plants that have ever been figured in that repository of wonders and beauties, the *Botanical Magazine*.

Karatis acantholobata, t. 6904.—One of the "nasties" Bromeliads, with broad, oblong, obtuse, toothed leaves, the innermost of which are coloured purple.

Achillea rupestris, t. 6905.—A very rare Calabrian species, allied to *A. Ptarmica*. It forms an attractive rock plant, and flowered on the rockery at Kew, in May, 1886.

Tillandsia chrysostachys, t. 6906.—A curious Bromeliad; native of the Andes of Peru. It has tufted leaves, which are oblong, strap-shaped, acute, spineless, and flowers in long-stalked closely-packed spikes, densely covered with overlapping yellow bracts, like the strands of some coarsely plaited rope.

Brodiaea Douglasii, t. 6907.—A pretty species, with long linear leaves, and scapes bearing an umbel of numerous violet funnel-shaped flowers.

— STOCKS FOR APPLES. — Mr. W. MORGAN, Pukehobe, East Auckland, New Zealand, writes:—"How is it nurserymen in Great Britain do not adopt blight-proof varieties of Apples for stocks, and thus effectually prevent Apple trees from being blighted at the roots? In this colony of New Zealand, the Winter Majesta and Northern Spy are now generally used as stocks, both for grafting and budding, the latter being the common mode of working Apples. These two varieties are not subject to attacks of the woolly aphid, and both being robust growers, they make excellent stocks, though their manner of growth is very distinct. The Majesta throws out roots, which extend a great length from the tree, while the roots of the Spy are one mass of rootlets and small fibres. Of course the Spy is found to be the best for dwarf trees, though some nurserymen prefer it to the Mjesta for all kinds of Apple trees, and use it exclusively. Stocks are raised with very little trouble indeed, simply by planting bits of roots in a similar manner to raising white Thorns. When the roots have struck and young plants are about 6 inches high, they are earthed up, the shoots sending out rootlets, and growing vigorously if the land is rich. Some of these would be fit to bud the following summer; but generally they are planted out when a year old, and then they make excellent stocks either for budding or grafting. In using these stocks the great advantage

is that the bottoms and roots of the trees worked upon them remain free from the aphid. And it is not a difficult matter to keep the tops clean so long as the roots are not affected. Years ago, before the introduction of these blight-proof varieties, so had was the woolly aphid in many districts, that Apple growers almost gave up in despair; but now the extent of Apple plantations is very great, and planting is still going on. I may state that it was a source of great disappointment that so many of the Apples sent from here for the Colonial and Indian Exhibition went bad; but this was owing to the bungling arrangements made by the Government with the direct steamer, no cool chamber having been provided for the fruit. A good opportunity was thus lost of displaying magnificent samples of Apples, such as can be produced here, both climate and soil being highly favourable to their growth and colouring."

— DIPTERACANTHUS AFFINIS.—We are indebted to Mr. JOHN CROOK, of the gardens at Farnborough Grange, for a specimen of this beautiful but little known plant. The plant is a stove shrub, with lanceolate leaves and irregularly funnel-shaped orange-red flowers about 2 inches long. Mr. CROOK grows it on the roof of the stove. As we hope to be able to give a figure of it shortly, we need say no more on this occasion; but we may express our wonder and regret that the numerous fine winter flowering Acanthads have not found more favour with cultivators. Several of them were in past years grown in the Palm stove at Kew, where they formed a special feature.

— LINNEAN SOCIETY OF LONDON.—A meeting will be held on Thursday, November 18, at 8 P.M., when papers will be read on—1. "Floral Conformation of *Cypripedium*," by Dr. MAXWELL MASTERS; 2. "Recent *Ephemerida*, part v.," by Rev. A. EATON; 3. "Further Contributions to the Flora of Madagascar," by J. G. BAKER; and 4. "Supposed Precedence of *Hivas in genus Conus*," by S. HANLEY.

— THE CRACKING OF PEARS.—This unsightly deformity is due to the presence of a fungus, *Fusisporium pyriforme*. M. KRILLIEX records that this disease may be cured by the use of a solution of sulphate of copper. One kilogramme of sulphate of copper is dissolved in 12 litres of water, to which are added a mixture of 2 kilogrammes of lime in 4 litres of water. The mixture is turbid and of a bluish colour, and is used by means of a small sprinkling brush made of ling, or more elaborate spray apparatus may be employed. The same mixture is very efficacious for the Vine mildew (*Peronospora*), and should be tried for the Potato and Tomato disease.

— ODEYPORE.—Mr. T. H. STOREY, the Superintendent of the Gardens of the MAHARANA of ODEYPORE, forwards us a copy of his annual report. Odeypore is the only station in Rajpootana, and one of the very few places in the native states where the garden establishment is directed by a professional gardener. Mr. STOREY, we believe, was trained in the Edinburgh Botanic Garden. The following extract will suffice to show the different conditions under which gardeners in India have to work from what obtain here:—

"FLYING FOXES.

"There has been a colony of flying foxes, which had taken up their quarters here for the past fifty years, and were quite a nuisance. They seemed to keep up all day a horrible screaming noise. They were hanging on to large Ficus, Mango, and other trees. There were also many swarms of bees, and the foxes had a very poor time of it. The bees appeared to hate them, and used to chase them all round the place. The trees were quite leafless, and to all appearance half dead. On His Highness coming one morning this way, I took the opportunity of speaking to him about them. He told me, if possible, to have them hunted away, an undertaking which, I am happy to say, was successful. I collected all my men and boys, gave them old tin pots, tom-toms, &c., and made them get up on the trees to the very top. When they began beating their tins, the whole of the foxes got on the wing, and kept them so for a few hours, when a few of them took the lead, and the whole flock went off three or four miles away. I expected them back in the morning, and I was not much disappointed, for they were returning to their old place from their night's feed; they must have been disgusted at seeing the men still perched in their quarters. The men

went up the trees at 3 o'clock in the morning, and did not allow them to alight, so off they went, and have not returned. The trees they were on are now covered with leaves and looking well."

— EUCHARIS AMAZONICA.—We often hear from correspondents of losses from disease and of weakness consequent on it, the maladies being various, and attacking at one time the foliage, at others the bulbs. One of the best modes of culture is that of planting in well-prepared beds or borders, enjoying the warmth from hot-water pipes either above or underneath the soil. As an example of this method, Mr. E. WARD, gardener at Hewell Gardens, Bromsgrove, sends us some foliage and flowers of enormous development, and of the utmost vigour. When plants can be kept in such a condition as are these, there can be small chance of the ingress of disease. Bulbs so planted out admit of being rested in the same manner as those in pots.

— PITCHER PLANTS AT MESSRS VEITCH & SONS.—It is hardly possible to see a finer collection of the various Nepenthes than can now be witnessed at this nursery, the house in which they are grown being literally crammed with pitchers in all stages of growth and size—from midgets the size of thimbles to others having the capacity of a pint-pot. Some of the more striking are Rajah, Northiana, Mastersii—of this last there is a long row of plants carrying a great number of high-coloured pitchers; *Kallesiiana*, and *Dominy's Intermedia*.

— GARDENING APPOINTMENTS.—Mr. C. FORD, late of Thornton Manor, has been appointed as Head Gardener to Mrs. CHARLES HAZLEHURST, Hulton Grange, RUACON.—Mr. JOSEPH HUMPHREYS, late Foreman at Woolton Wood, has been appointed Head Gardener to J. KERSHAW, Esq., The Mount, Sedgley Park, Prestwich.

Notices of Books.

Chrysanthemums and their Culture. E. Molyneux. (London: 171, Fleet Street.)

This little book on the best of our autumn flowers, by one of our foremost growers, is worthy the attention of all those who would excel in the exhibition tent, or as growers of the flower for domestic use. The directions, of all kinds are very full we had almost written, too full—for out of the abundance of his knowledge the writer is apt at times to say so much and to give more than the proverbial three courses; so that the tyro would be in difficulty as to how to best to follow. As a true practical cultivator above all things he begins at the beginning, by initiating the reader into the secrets of propagation, and does not attempt to write up the history of the plant. By easy stages the subject is led up to the cultivation of plants and flowers for exhibition primarily, and for the decoration of the conservatory and greenhouse, various woodcuts being employed to make clear the writer's meaning. The, to many gardeners, mysterious art of disbudding receives ample attention, diagrams of disbudded shoots being added for fuller explanation.

The lists furnished of varieties for walls, borders, for supplying plants and blooms for market, the heights of varieties, summer blooming varieties, summer treatment and autumn treatment, are all fully and well treated.

And we need scarcely say that all matters pertaining to exhibiting the flower are quite as fully expatiated on, affording the ingenious reader the idea that, after all the labour spent in cultivating the flower, Nature at last requires a large amount of assistance before its toilette can be considered perfect, and the flower is fit to take its place on the exhibition-table.

We think the author is guilty of dogmatizing somewhat in the little chapter on the leaves of the plant, in stating that many kinds can be determined by the leaf. That such can be done by an expert who has the means for comparison may be true, but that this can be done by any one with the thousand and one sorts now in the field is matter of much doubt. Soil, the sorts of manures used, the age of the leaf, and its position on the plant, all exercise a modifying influence on its form and colour.

The chapter, "Waiting for the Verdict," is a blemish, and should be left out of the next edition.

HOW DO BULBS DESCEND INTO THE SOIL?

IN Mr. G. Maw's new monograph of the genus *Crocus*, p. 18, fig. 14, there is a diagram showing the way in which young *Crocus* bulbs descend into the soil, year after year, until they reach a convenient depth. The author says:—"The process of the descent of the corm from near the surface to the necessary depth is difficult of explanation, and must be viewed as one of the self-protective phenomena in plant-life, the *modus operandi* of which we do not understand." Another phenomenon described in the same chapter, p. 17, and illustrated on plates A and C, is the epimeral root, always present in the young seedling, and occasionally reproduced in after years, to which Mr. Maw does not assign any special function.

This epimeral root, which is almost like a soft, spongy, semi-transparent elongation of the bulb, but pinched in at the point of juncture with its base, is not peculiar to the *Crocus*, but occurs in other bulbs, especially in seedlings of the genus *Scilla*. I fancy I have noticed it to be formed more frequently in old *Crocus* bulbs, when they have been brought near the surface in the process of digging a bed; and I have always thought, rightly or wrongly, that it was an effort of Nature on the part of the bulb, not always successful, to descend to a greater depth. Last spring observing a pan of *Narcissus corollaria* var. *Ctusii*, which had been planted very shallow, to be prematurely withering, I examined the bulbs, and found that two or three of them had formed new bulbs beneath, but quite detached from, the old ones, and connected with them by what seemed to be a shrivelled epimeral root, about half an inch long, which had apparently acted as a sort of umbilical cord to convey the nourishment from the leaves through the old bulb to the new bulb which had formed at its base. Had I known that the process by which new bulbs are formed at a distance beneath the old ones was not well understood I would have investigated it long ago, and I hope to do so now next season; but I call attention to it here, hoping that others who are better able to make scientific observations in botany may investigate it. My suggestion is that the epimeral root may act as a sort of vertically descending stolon, producing a new bulb not quite in the same way as the lateral stolons of *C. nudiflorus* and *C. lazicus*, but forming its central axis within the thickened root. I find *Crocus* seedlings such a nuisance in my borders that I always have the seed-pods pulled off the bulbs in June so I cannot examine *Crocus* seedlings as I should like to do; but as regards the change of depth in successive years in the bulbs of *Scilla nutans*, which is probably analogous, I have often observed the fact whilst planting trees in my woods in winter. The smallest bulbs, which I take to be the produce of the seed shed eighteen months before, in the July of the previous year, are at a depth of 1 or 2 inches, and at the size of a small Pea; the two-year-olds are at an average depth of 4 inches, and at least 70 per cent. of them are curiously elongated, being three times as long as broad. Those three and four years old—for I think some rest contented with the depth reached in the third season's growth, and some take another dive in their fourth season—are 6 or 7 inches deep. Thus the crown of the new bulb is, on an average 15 inch below the base of the old one and I feel no doubt that it is formed where it is found. Indeed, on no reasonable theory could it be otherwise. I enclose specimens of bulbs, one, two, three, or more years old, with a rough outline of the depth at which they respectively occur. *C. Wolley Dod*, *Edge Hall, Malpas, November 6*.

[In order to illustrate this communication, we append two illustrations in *Crocus* (figs. 123, 124, p. 628). The new bulbs, as may be seen in Tulips, are formed in a little cavity at the base of the inner surface of a scale or leaf. The base of this leaf-scale, with the enclosed bulblet, grows in a downward direction so that ultimately a tube is formed something like the spur of a Tropaeolum but with the bulblet at the bottom. How the leaf grows in this fashion is, we believe, not known—why it does so is probably to protect the bulb from frost or marauding enemies. The so-called "epimeral" root is met with in many bulbs. It probably acts as a special and accessory storage place for nutriment, which is used up as the bulb grows. We do not think the epimeral root ever has a bulb at the end of it as Mr. Wolley Dod, if we understand him aright, seems to think, and the structure of this root and of the descending leaf-tube is different. ED.]

SCOTLAND.

AN EXTRAORDINARY ARDISIA.

THERE is growing at the present time in the Edinburgh Botanic Garden *Ardisia primulefolia*, the most extraordinary species of the family with which I am acquainted. It is almost stemless; its five or six leaves, 4 to 6 inches long by $\frac{1}{2}$ to 2 inches broad in the individual before us, being supported on a stem barely two inches high, and overlapping the sides of the 5 inch pot in which it was growing, very much in the way of many *Primulas*. Standing clear above the foliage on stout stems were two fine clusters of bright shining scarlet berries of an oval shape, and very ornamental. As it is, it would be an acquisition to the list of ornamental berried plants for winter decoration, its dwarf habit rendering it suitable for positions to which we have nothing of the kind at present.

PAROCHETUS COMMUNIS.

This interesting and pretty plant is turned to excellent account by Mr. Lindsay as an ornament in hanging baskets in the greenhouse. Treated in this way it grows more freely than when planted on the rockwork, or in pots, as it usually is done, and stock is therefore more easily kept up, which was the object Mr. Lindsay had chiefly in view in resorting to this method. But he is very pleased also with its ornamental effect, and intends to continue and extend its use as a basket plant.

RESTIO SUBVERTICILLATUS.

The elegance of this distinct plant should commend it for the cool conservatory. It is rarely seen, perhaps hardly known, in private gardens, but we are certain that if its striking effect as an elegant decorative plant were better known, it would be in demand for the decoration of the cool house. The plant is, roughly speaking, a shrubby Sedge, and belongs to a small order to which it gives its name, closely allied to the Cyperaceæ. Its characteristics are most effectively seen in large specimens. A.

THE DRY ROT FUNGUS.

MERULIUS LACHRYMANS (FIG. 125).

THE dry rot fungus is one of the most widespread and destructive of all fungi. It is especially common and well known on the squared timber of ill-ventilated buildings, and from dressed wood it will quickly spread to walls, whether built of stone, brick, or concrete; it will often grow through the mortar of a thick wall, and perfect itself on the bricks both outside and inside. We have seen it growing on damp concrete between the girders of iron fire-proof floors, and seen it spread from wood on to plate-glass, and perfect itself on the latter substance whilst drawing its nourishment from the wood. In wine cellars it will spread from the woodwork and walls to the bins and even to the corks of wine bottles. The mycelium of the fungus will luxuriate between the cork and the neck of the bottle; a slight attack of this sort is said to make the wine "corky."

The dry rot fungus prefers the squared unpolished wood of coniferous trees as a substratum on which to luxuriate, but we have seen it on polished Mahogany, and it will spread from other woods to Teak and destroy Teak-built ships. It is not uncommon on the fallen timber of Pine woods, but, like some other plants, it has long been peculiarly associated with man and his dwellings. It destroys churches, houses, ships, bridges, railway sleepers, telegraph poles, and many other objects. It must not be assumed, however, that the true dry rot fungus is the sole depredator. There are twelve British species of *Merulius*, inclusive of *M. lachrymans*, and several of these appear at times in our houses. We have seen *M. corium* almost as destructive as *M. lachrymans*. In addition to the dry rot fungi it is by no means uncommon to find buildings destroyed by different species of *Polyporus*, *Lentinus*, and other fungi.

Merulius was so named by Fries on account of the shallow pores or wrinkles of the spore-producing surface, and *lachrymans* on account of the drops of moisture, like tears, which stud the fruiting surface of the fungus when growing in full vigour.

The upper part of the accompanying illustration (fig. 125, p. 629) shows a small plant of a dry rot fungus; the circumference is white or livid in colour,

and thick and fleshy. The whole plant is fleshy and almost meaty when cut. The odour is very strong and Mushroom-like. The livid rim consists of transparent interwoven fungus tubes and cells as illustrated enlarged 400 diameters at C; tubes of this nature and size also form the entire base of the fungus. The fungus cells or tubes break down the substance of the wood upon which they grow and transport the juices of the wood to the fungus for nourishment. The central part of the surface of the *Merulius* is rich reddish-brown in colour and indented with coarse shallow-pores or wrinkles, as illustrated in the upper figure. A reddish livid juice is exuded from all parts of this fungus; this juice stains every object with which it comes in contact. A section of the wrinkled surface is shown natural size at A. Every part of the reddish wrinkled surface produces spores, the same portion distils drops of moisture chiefly derived from the wood upon which the fungus grows. By breaking down the substance of the wood and extracting its juices the timber is ultimately left in a state little better than dry sawdust or powder, hence the popular name of "dry rot," a curious name for a naturally wet or "weeping" fungus. If a very small fragment is cut from the wrinkled surface of an example of *Merulius lachrymans*, and a very thin transparent slice is then removed from the exposed surface and examined with a microscope it will be seen, if enlarged 400 diameters, as at B. The coarse transparent tubes of the base of the fungus become much narrower as they gradually grow up towards the brown wrinkled surface, and in the latter position they support tall colourless cells or bladders as shown; each tall bladder throws out four minute horn-like spore-supporters, at its apex, and on each horn an oval spore of rich brown colour is borne, as illustrated. When the ripe spores fall from their supports on to damp wood in close confined air they germinate and throw out fine mycelial tubes, the tubes penetrate the sweating wood and soon produce a perfect dry rot fungus by drawing from the wood the material necessary for the life and well-being of the fungus. The fungus continues to grow till the supporting timber is completely exhausted and reduced to tinder or dust; the fungus itself now perishes, but not before it has produced myriads of spores which have probably been carried away by currents of air to destroy other damp wood or wood in damp places. The dry rot fungus will under favourable conditions attain a very large size, its dimensions appear, in fact, to be only limited by the size of the object or material on which it grows; we have seen huge thick growths, like large pancakes, a yard or more in diameter. As the growth of the fungus is as rapid as it is exhaustive, it follows that when dry rot once gets a footing in an ill-ventilated building the work of destruction is rapid and complete. Floors rot, roofs fall, gables collapse, and window sashes turn to powder and drop out. As the air of the infested building is full of dry rot spores it is useless to replace old wood with new, for new wood merely supplies fresh food for the fungus. Sometimes improved ventilation is beneficial, but it is impossible to really cure dry rot, and almost if not quite impossible to stop its progress when once well started, as the fungus is always ready to invade various other materials in addition to wood. To keep well clear of dry rot its attacks should be prevented.

Petroleum will quickly destroy the dry-rot fungus, and prevent its reappearance, but it is so extremely dangerous to thoroughly soak a building or ship with petroleum, that the remedy is as bad or worse than the disease. Burnett's mode of preserving timber is by the application of chloride of zinc; this, without injuring the wood, has a tendency to protect it from destruction. Kyan's method (hence the term kyanising) consists of the use of corrosive sublimate, but this material can only be applied effectually on dry (as opposed to wet or damp) timber. Margary's method (hence the term margaring) consists in the application of the sulphate or other salts of copper. Bethell's method, which is the best, consists of "creosoting" the wood, by the application of coal tar or oil of tar. This substance does not get driven out of timber by moisture, whereas all the salts of metals fall in this direction. Coal tar, a material which looks like treacle, is derived from coal in the process of gas-making. When coal tar is distilled, light oils, heavy oils, and pitch (the residuum) are produced; the oils heavier than water are the "creosote" of Bethell. The most effective heavy creosote for timber preservation is

derived from the best Newcastle coals, a less valuable material is distilled from Midland coals. A good deal of our knowledge of wood preservation, as possessed at the present day, seems to have been known in part at least to the ancient Egyptians, who filled the pores of their wooden statues, columns, &c.,—to say nothing of the grand-mummies (1),—with oils and bitumen.

Mr. Boulton states that Fir timber is capable of taking up from 62 to 150 gallons of water to the load of 50 cubic feet, he also states that he has extracted 50 gallons of water from a load of railway sleepers. In the process of creosoting the timber is first made quite dry and the extracted water is then replaced under heavy pressure, by oil of tar. More than one patent has been taken out for "creosoting," and the efficacy or otherwise of creosoted timber depends on the quality and constituents of the oil of tar and the method of forcing it into the pores of the timber.

The proper antiseptic treatment of wood is a subject of the highest importance when studied in reference to the preservation of telegraph posts, railway sleepers, piles for harbours, ships' timbers, and to cases where wood must necessarily be exposed to the action of water, damp earth, or moist air, but in buildings which are designed to be constantly kept dry no creosoting is necessary. In horticultural buildings, however, where the contained air is always moist, the dry rot fungus, or one or other of its allies, often makes sad havoc. Tiles, iron, &c., are now so much used in greenhouses that wood often only occupies a minor place in their construction.

Without some antiseptic treatment it is impossible to prevent the decay of wood when it is placed in water or as in posts, and piles, buried in the ground, but there is no reason why our public and private buildings should be so constantly destroyed by the dry rot fungus. Without damp stagnant air and wood saturated with moisture *Merulius Icterymus* cannot exist; keep these evils away, and no dry-rot will be seen.

It is very necessary that foundations should be well built with cement on concrete or rock, that all the basements should be thoroughly well ventilated, so that currents of air may be able to pass through windows or other openings. The timber used for building purposes should be perfectly sound and dry. All good builders are aware of the best methods for preventing damp rising from basements, or passing up or through walls; and it is only by the culpable neglect of well-known common-sense precautions that so many public and private buildings are destroyed by the dry-rot fungus.

We are being constantly asked for a "cure" of dry rot, and we of us find ourselves without patience to write a reply. It is as impossible to "cure" rotten timber as to "cure" a rotten animal; when advanced in decay both are too far gone for cure. Common sense must be used in the prevention of the attacks of the dry-rot fungus.

Dr. J. Gwyn Jeffreys says (*British Conchology*, vol. 1, p. 139, under "Limax") that slugs in cellars will eat at the dry-rot fungus. *Worthington G. Smith, Dunstable.*

HOME CORRESPONDENCE.

Orchid Pruning.—This practice has been advocated by many growers, and no doubt in many cases it is necessary to do so for neatness, as well as to remove useless and decaying bulbs, as in the case of *Ceoloyne cristata*, *Odontoglossum grande*, and others. With some Orchids one might hesitate before doing so, as is the case with *Dendrobium speciosum*, a plant growing here, which has been mentioned in the columns of the *Gardener's Chronicle* in years gone by. However, the plant now measures 3 feet 6 inches in diameter, and flowers every year, on one occasion having from thirty to forty spikes of bloom; the bulbs with leaves on flower year after year, but the most curious part is that some of the bulbs without leaves for many years are showing flower-stems: one bulb has two. Those bulbs with leaves constantly throw two spikes on some of their number. This season the plant promises to be fine, but is not sufficiently advanced to enable me to speak with certainty as to the number of spikes. A companion plant, *Odontoglossum grande*, 2 feet in diameter, had fourteen spikes of bloom, twelve yet remaining. These plants, with others of their class, have to share the treatment of the Vines, under which they do so well. *William Cutwell, Thorpe Perrow.*

A Japanese Rose Hedge and Plant Protection.—While experimenting at Oakwood I have come upon two notions which I think are worth publishing. The first is a new hedge; we tried a small one in front of the cottage, and this succeeding, we have now made one above a hundred yards long, of Japanese Rose (*Rosa rugosa*); the beauty of its

flowers, fruit, and foliage—the last while green, and afterwards in its green state in autumn—make it ornamental, while its quick growth and many and close thorns make it useful. The plants of our last hedge are seedlings taken out of a seed-bed not more than 2½ yards square. This hedge has a backing of cut Furze; I expect in two years it will be well grown up.

Notton N., 2 is a substitute for snow as a protection for some of the plants, and, as is well known, owes its efficacy to the air among it; I have tried my experiments to get something that would take its place. Finding that plants sowed themselves on our gravel walk, and came up better than in the seed beds, I used a surface of fine sifted gravel with good results, and now believe that for bulbs which it is undesirable to plant very deep, and yet which must not be frozen, a covering of 3 to 4 inches of sifted gravel stones about 1 inch long will hold air enough to prevent the frost getting down into the ground and be easily removed in spring. With some precious bulbs and deciduous plants I have put a surrounding of bricks edgewise, filling up the enclosed space with these gravel stones; smaller stones may be better: this is a subject for experiment. *George F. Wilson.*

Double-Flowering Primula sinensis.—These beautiful flowering plants being so desirable and valuable for cut bloom, as well as for decorative purposes, we forward you some of the varieties we now have in full bloom for your inspection. Considering that these plants go on flowering all the winter and early spring months, we have no hesitation in saying that they should be grown largely where cut flowers are in demand. The difficulty of their propagation and culture seems to be a barrier in the way of their popularity; but surely our gardeners can overcome this matter, as they have overcome many other of the most capricious cut flowers are now required in every household. *Clark Brothers, Carlisle.* [Excellent samples.—Ed.]

Fuchsia coccinea and Neglected O.d. Sorts.

I send you some flowers and foliage of *F. coccinea* and *F. magellanica* to show you that they are not one and the same kind. The latter was kindly sent here by the Rev. Dr. Gordon, of Birco, author of the *Flora of Monty*, whom I knew had the true *magellanica* through having seen it there some years ago. His own letter, which I forward, will best explain its history in the North of Scotland. *Cocinea flexuosa* is from a plant growing on a trellis on the north side of a cottage uninhabited in a flower garden here, and must have been there for at least forty to fifty years. It is mostly cut down to the ground every winter by frost, but always comes up again in spring. It has never received any attention in covering, not even to keep the frost from its roots. I may here remark that I can remember perfectly when *Fuchsia coccinea* was the only one in cultivation. Later introductions must be much known until about 1830, although such varieties as *virens*, *coccinea*, *tenella*, &c., were introduced some five or six years previous to that date. *Cocinea* and *virens* are both alive here also. They had been planted at the top of a mound of rockwork, which is now covered all over with *Cotoneaster rotundifolia*. The *Fuchsias* grow through it every year and flower freely. Perhaps the next hardiest sort to *magellanica* is *Riccartoni*; it has survived some of our severest frosts with but little cutting down. The plants are growing on grass amongst shrubs on the sloping banks of an old quarry. Since the introduction of *F. Venus Victoris*, the first white-petalled variety, hybridising has gone forward with so many improvements that the useful old sorts are now thrown in the shade. *J. Webster, Gordon Castle, Aberdeen.* [As has been mentioned previously, *F. coccinea* was not among them. The true *coccinea* is a Brazilian species, now very rare in this country. See *Bot. Mag.*, t. 5742. *W. B. Hemsley.*]

Abutilons as Climbers.—Probably better pillars than any other species and varieties of Abutilons are not yet, but very rarely are they to be seen occupying such positions. They are admirably adapted for the back walls of greenhouses. The species suitable for this purpose are *Abutilon tessellatum*, A. Thompsoni, and A. vexillarium. This trio, it scarcely needs to be said, will grow well in almost any position and any kind of soil. Even under artificial culture they are almost as tenacious of life as our native Mallow; nevertheless, one kind of treatment they are commonly subjected to at present is very inimical to success with them, and it consists in cutting the plants back to insure a bushier and dwarfer form. This practice destroys more Abutilons than do all other hardships they may have to endure. It may be the two former are too robust to be plucked as climbers in small houses; the last, however, is well adapted for the smallest of structures where pillars or bare back walls have to be covered. If the first two, or the erect deciduous habitated *Hibothamnium* (*Cestrum*) is suited for pillar work, certainly these more graceful plants are more

so. In greenhouse furniture, however, as in other fashions, it would seem to be that one grower adopts the same subjects as another, and it is difficult to convince people that other and better things exist. How frequently do we meet with *Teocoma jasminoides*, the deciduous *Masdevallia suaveolens*, *Solanum jasminoides*, or *Kennedya*, planted against pillars, with the result that fresh young growths rush upward, reach the glass, and there expend themselves, to the loss of any pleasing remains lower down. And even when a truss or two of bloom casually forms on the sparse current year's growth, they are so encircled by foliage and hang so high up as to be barely perceptible against the expanse of sky and light. These species of Abutilon, which are not so subject to these drawbacks, certainly deserve increased consideration at the hands of gardeners. *William Earley.*

Adiantum Seedling Edward Henry Walton. —Among your Answers to Correspondents (p. 611) we find you inquire whether this *Adiantum* seedling is likely to reproduce itself from spores. We have only 1 tied one lot of spores, the produce of which were potted last week. We used no particular precaution with the spores, which have come true to character. We think it a very elegant fern. *E. H. W., Edgeland Nurseries, Buxton.*

Late Peas.—We gathered our last dish of Peas on November 6 of *Ne Plus Ultra*. Sturdy I have grown for the first time this season; it is a good late variety, and I intend giving it a further trial next season. Owing to the frost on the evening of November 8 we registered 7°, therefore all Peas and Beans are now cut off. The varieties that have produced a daily supply from June on throughout the season are, *Dickson's First and Best*, *Victor's Selected Extra Early*, *Dry's Early Sunrise*, *William the First*, *Laxton's Alpha*, *Champion of England*, *Criterion*, *Pillbasket*, *Huntingdonian*, *Supreme*, *British Queen*, *Empress of the Marrows*, and *Ne Plus Ultra*. *Edward Wark, Howell Gardens, Bromsgrove.*

Grafted Grapes.—Allow me to bear testimony to the correctness of Mr. Warden's remarks at p. 597, respecting the highly-finished bunches of Black Alicante Grapes resulting from a rod inarched on a Blackland Sweetwater Vine in the Clarendon Park vineeries. I saw them in September last, and the bunches of large, well-coloured, and heavily-bloomed berries, were symmetrical in outline and averaged about 3½ lb. each, every one of which would do credit to the exhibition-table. Last year I inarched a young rod of Black Alicante on a strongly growing Syrian Vine, and which is carrying two bunches this season, the berries of which are larger and more heavily bloomed than those on the parent Vine are. In another late house I have this year inarched Gros Maroc on a Syrian Vine, and on either side of the Syrian Vine, which is bearing a heavy crop of Grapes this year; young pot-Vines of Alwrick Seedling and Muscat Hamburgh are inarched, the former on *Barbarossa*, and the latter on *Raisin de Calabre*. I intend taking a bunch on the Muscat Hamburgh Vine next season, but the Gros Maroc and Alwrick Seedling Vines having been inarched rather late in the season will not be cropped next year. I look forward to securing larger bunches from the Alwrick Seedling and *Barbarossa*, and the Gros Maroc and Syrian unions, and of quite as good flavour as I could obtain from the respective varieties on their own roots; but I cannot expect to improve the flavour of the Muscat Hamburgh Grape by its union with the *Raisin de Calabre*, if I do the size of bunch. Last spring I inarched a pot Vine of Golden Queen on a Muscat of Alexandria with a view to improving the flavour of the former Grape, which, when grown as it was shown by Messrs. Murray (Culzean Castle, Maybole) and Hammond (Brayton, Carlisle), in Edinburgh at the September show of last year, is a grand looking Grape. I have Gros Maroc on a Black Hamburgh stock trained up the back wall and rather of hip-roof house with very satisfactory results as regards flavour, size, and colour of berries, which latter retain their oval shape. So pleased am I with the result of this Gros Maroc and *Hamburgh* union that last spring I twelvemonths, having then raised several young Vines from eyes for transplanting in a permanent border, towards the end of July following, I inarched Gros Maroc on a Black Hamburgh Vine while both were in 7-inch pots, and which, together with two Vines of Gros Maroc on their own roots, Alwrick Seedling, *Madresfield*, and Muscat Hamburgh (the latter at the warmest end of the house, and planted at the time indicated in a newly-made outside border). The Vines were heavily shaded from bright sunshine until the roots had taken to the new soil, when shading was discontinued; they were also syringed overhead two or three times a day to keep the foliage fresh. These Vines have all made satisfactory growth during the interval, and next year I hope to take three or four bunches (more or less, according to the strength of the individual Vines) from each rod, and at the same time have an opportunity to note the difference between

the produce of the Vine of Gros Maroc on its own roots and that of the one on the Hamburg stock, both growing in the same border and under the same conditions. I may here state a fact which, though it is well known to all good Grape growers, is not known so well as it ought to be—that all Grapes, except the Frontignan, and perhaps the Duchess of Buccleuch, are improved in flavour by being grafted on Black Hamburg and Muscat of Alexandria stocks; but that the two varieties just mentioned deteriorate more or less in flavour when grown on other roots than their own. *H. W. Ward, Longford Castle Gardens.*

Crows and Poisonous Wheat-Dips.—A curious illustration of the sagacity or instinct of the common rook, or crow, came under my notice this morning. I was scattering seed Wheat that had been previously impregnated with Goulding's Wheat-dip, or anti-smut mixture, and the seed dried out with slaked lime. A flight of crows came for their maternal meal, and swooped down on what I had sown. I observed them commence ravenously, and after a few moments hesitate, and finally retreat to the headland and remain there. Others came, but the cawing and circling flight seemed to indicate a note of warning. Farmers and gardeners having a home farm might profitably bear this in mind. There is the saving of an animate or inanimate scarecrow, in seed, in the evenness of the braird, &c. *W. F. Murphy, Clonmel.*

Winter-flowering Ericas.—Young stock of these indispensable plants now bristling with flower-buds will need close attention in respect to watering, especially if recently purchased from the growers. As they are invariably pot-bound at this season they require a good supply of water. If this is neglected now the result will be seen by-adding in either undeveloped or malformed flowers. *F. Hudson.*

Ivy-leaved Pelargoniums.—In his remarks on these (p. 533) Mr. H. Dunkin omits what is in my opinion the most satisfactory mode of treating the plants in order to have a good supply of flowers for cutting during the dull months now upon us. That large plants bloom freely when trained on pyramidal trelliswork during the spring and summer months there is no question, but to insure a large amount of bloom from now onwards they do not receive sufficient light. My mode of treating them is to pot into 10 and 12-inch pots during May, and to fix a rough trellis against a wall (exposed to the sun), then train the shoots thinly, and keep all flowers removed until the end of September, when the plants are taken into a Melon pit and the shoots trained along the wires about a foot from the glass. Here they are fed with liquid manure, and the pipes are kept slightly warm, and plenty of air given. Some of the plants cover a space of 6 feet by 4 feet, and have from sixty to a hundred trusses of blooms, which are very useful for cutting purposes. *H. J. Ireland, Nestell Priory.*

Reports of Societies.

ROYAL HORTICULTURAL: Tuesday, Nov. 9.

AFTER the very full exhibitions that have been held in the conservatory at South Kensington during the season now drawing to a close, the show at this meeting was a very scanty one. It was fortunate that the Canadian and Nova Scotian exhibits of fruit and farm and garden produce still remained to occupy the centre and half of the side tables. The miscellaneous exhibits were chiefly Chrysanthemums shown for certificates and a few Orchids and Cyclamens.

Scientific Committee.

M. T. Masters, F.R.S., in the chair.

ORCHIDS, DRAWINGS OF.

A large and beautiful series of pencil-drawings of lips of *Odontoglossum crispum* were shown by Mr. Hensen, of St. Albans, with a view of showing the range of variation. Mr. O'Brien remarked that their forms indicated in many cases the parentage, thus a triangular form was characteristic of Lindley's; a broad truncate shape that of Pescatorei, &c. This showed that all the forms were results of crossings and natural seedling from crossings.

A Vote of Thanks was awarded to Mr. Hensen.

CYPRIPEDIUM SPECIOSUM, MONSTROUS.

Dr. Masters showed drawings illustrative of fission in the posterior sepal and staminode; it commenced by furcation or partition of the fibro-vascular cord at the base of the ovary, and affected both the above organs.

"JUMPING" SEEDS FROM MEXICO.

Mr. MacLachlan showed specimens of the Jumping Seeds from Mexico, which, when placed on the table, were in frequent movement. The motion was due to the presence of a grub in the disjointed carapels of an euphorbiaceous plant. The insect is closely allied to the Apple moth, *Carpocapsa pomonella*. It was first noticed by Westwood in 1858.

INIA BULBS DISEASED.

He also showed specimens, received from Scilly, of bulbs possessing channels filled with gummy matter.

FIG. 123.—CROCUS, SHOWING SUCULENT AND FIBROUS ROOTS. (SEE P. 626)

FIG. 124.—CROCUS, SHOWING FORMATION AND MODE OF GROWTH OF THE PLANT. (SEE P. 626)

No trace of fungi or animal life could be detected. Mr. O'Brien said he was familiar with a similar condition in Crocuses, and attributed it to wet. Mr. Murray suggested defective nutrition, and would report on a further examination of the bulbs.

PRIMULA CAPITATA.

Mr. Wilson showed a specimen of a very large form grown from Himalayan seed. He observed that

there were now three forms in cultivation, a short, intermediate, and now this new tall form. Mr. Henslow had examined the flowers and found them to be the "short-styled form," but with the anthers dwarfed to a height no greater than the ovary, apparently indicating the fact that the staminal whorl tends to degenerate when great vigour is assumed by the plant; the pistil and large reddish stigma appeared to be quite perfect.

CANADIAN INSTRUMENT FOR PRESSING FRUIT.

He also exhibited a sample of a strong galvanised iron instrument for squeezing juice for jellies, &c., sold in the Canadian department of the Exhibition.

SYCAMORE ROOT, HYPERTROPHIED.

Mr. Henslow exhibited a dense mass of root-fibres which had completely filled a water-pipe; he also showed a slender thread-like Turnip root, about 6 feet long, which had been extracted from a field drain.

ANTIRRHINUM MAJUS AND A. ORONTIUM, PELORIA OF.

The same gentleman showed specimens with illustrations of dissections of these "regular" flowered Snapdragons, both occurring in gardens at Penmen-mawr; also "sleeve-like" flowers of *Calceolaria*, in which the corollas had become regular.

JERUSALEM ARTICHOKE IN BLOSSOM.

The secretary also exhibited a blossom received from Wilts, and observed that in warm autumns it often forms buds, but does not usually blossom.

MONSTROUS ORCHIS.

Mr. Henslow exhibited a dried specimen in which the inferior ovary was replaced by a long stalk, the perianth consisting of three small pointed sepals, within which were two anthers on opposite sides of a depression with a corrugated rim, the processes on the borders resembled the gland-like processes corresponding to the usual abortive stamens.

PRODUCE OF FLUG-GRAFTED POTATOS.

Mr. Henslow communicated specimens of tubers and drawings of others, raised this year from a tuber, one of the produce which resulted from Mr. Worthington G. Smith's experiments in 1885. The tuber planted last March weighed 6½ oz., and the produce was 6½ lb. The results of Mr. Smith's experiments were remarkable for the contorted state of the tubers. Many of this second year's crop were similarly bent, but ten tubers were oval (3 by 2 inches), and of a good shape. The cross was between Magnum Bonum and Early Border.

TOMATOS ATTACKED BY PERONOSPORA INFESTANS.

Mr. W. G. Smith exhibited Tomatoes attacked by the common Potato disease, as well as Potatoes attacked by the Potato smut, *Tubercinia scabies*, which produced wart-like pustules all over it. It was the first occasion on which this disease had been exhibited.

HYBRID BEGONIAS.

In reference to the remarks of Mr. Meehan in the last number of the *Gardener's Chronicle*, Messrs. Veitch exhibited their Begonia John Heal. This was a hybrid out of a South American tuberous kind by the pollen of the East African *B. socotrana*. The plant is intermediate in several particulars between its parents, but its special peculiarity is that all the flowers are male flowers, and that they are retained on the plant for several days instead of falling off speedily. Moreover another hybrid, raised between the pollen of this variety and an ordinary tuberous Begonia, produced a tuberous Begonia which also bore male flowers only.

MASDEVALLIA ACHROCORDONIA (Rehb. f.).

A plant, flowering for the first time, was exhibited by Mr. S. Courtauld, of Braintree. It appears to be somewhat intermediate between Philippinensis and Schlimii. A Botanical Certificate was awarded it.

PLANTS FROM THE BOTANIC GARDENS, CAMBRIDGE.

Mr. J. Lynch showed *Ecalloia revoluta* with small white flowers, being a perfectly hardy species; *Paspalum fectida*, remarkable for the feathery stipules and sepals, and *Euphorbia punicea*, with brightly coloured bracts.

MALFORMED LILY, &c.

Mr. Lynch also showed a flower of *Lilium longiflorum*, in which the segments of the flower were separate to the base, and a specimen of *Lonicera microstachya*, in which the stem was twisted spirally, so that the leaves were placed in one continuous line.

CORYLUS COLERNA, WITH FOLIACEOUS ERACETOLES.

A specimen was shown by Dr. Masters, in which

the two usually small bracteoles had grown out to a considerable size.

FIGS.

Dr. Masters showed leaves from a tree growing on the Roman walls at Reculver, and said to have been introduced by the Romans, but it was a form of the *C. P.* with abortive female flowers, and not the male or wild Fig, and he thought it more likely to have been introduced by the ecclesiastics of the Middle Ages. Mr. Barron had identified the Fig as the Black Provence. He also showed a leaf from Cardinal Pole's Fig from Lambeth Palace, lately described in the *Gardeners' Chronicle*.

Floral Committee.

Present G. F. Wilson, Esq., in the chair, and Messrs. Shirley Hibberd, W. Wilks, II. Bennett, W. Bealby, G. Duffield, II. Herbst, T. Baines, W. Holmes, C. Noble, H. Ballantine, J. Dorniny, II. M. Pollett, J. O'Brien, Hugh Low, E. Hill, A. F. Lendy, G. Paul, and II. Cannell.

Sir Trevor Lawrence, Bart., M.P., showed *Angraecum aviculare*, a graceful species, carrying racemes of white flowers, the spur 4 inches long and curved. Messrs. J. Veitch & Sons, Chelsea, showed *Oplismenus albidus*, a variegated Panicum-like grass, very dwarf, the foliage an inch and a half in length and acutely pointed. The colour is white with a green band running longitudinally through the middle of the leaf. *Amaryllis Lady Mayoress*, crimson, with reticulations of the same on a suffused pink ground, each segment having a broad band of white in the middle of it; *Calanthe hybrida*, a strong grower, with white flowers; *Zygopetalum topardium*, a small established plant with a new break or two, and one flower; this has sepals and petals of an inch long, green, spotted with brown, the lip purple, margined and dotted with white. *Masdevallia glaphyrantha*, a small flower of dull purplish crimson, the tails 2 inches long, and yellow tipped; the plant bore one flower. A number of new varieties of *Chrysanthemum* were also shown, comprising some of the best kinds mentioned in our account of the flower at this nursery (p. 622). *Amasonia punicea* was likewise shown in bloom.

Mr. Head, Superintendent, Crystal Palace, showed *Clerodendron nutans*, a strong growing stove shrub, with strap-like foliage 6 inches long by 1½ inch wide; the shoots furnished with terminal pendulous clusters of single five-petalled flowers, white, with light brown calyx. This is a showy, graceful, uncommon looking subject, worthy the regard of all gardeners. Messrs. Cannell & Sons, Swanley, showed cut blooms of *Chrysanthemum*, of which the following were the best:—*E. Molyneux*, red-chestnut of bright hue, the reverse of the florets being orange; *Rose Favourite*, a tender pale flesh, very handsome; Admiral Sir T. Symonds, of brilliant yellow, semi-double, the disc showing an orange colour; Jane, a white throat flower, and the same characteristics as the preceding; Mrs. Cannell, another semi-double, of a white colour, with an open disc; *Lucie* (Cullingford), red-chestnut colour; *Lady Dike*, a mauve-coloured three-petalled flower. *Thorne Junior*, yellow, the centre florets crumpled—a flatfish, reflexed kind; Mr. J. Matthews, of an orange colour, with flat florets; C. L. Teasdale, a flesh-coloured flower, very pale of hue, with the centre florets yellow; Neatness, a quilled pompon, well deserving its name. With the exception of the last named, the above were of the hybrid Japanese section.

Mr. Wright, gr. to E. H. Watts, Esq., Devonhurst, Chiswick, showed *Chrysanthemum* Thomas Wright, a white sport from Queen of England, beside Empress of India, to show its superiority to that variety.

Messrs. Heath & Sons, nurseries, Cheltenham, showed two varieties of *Lyxias*, Besti and splendens, but which, however, were not in a condition for us to be able to speak as to their merits.

Mr. Ross, gr. to G. Maclay, Pendell Court, Blethingly, showed *Pontederia crassipes* var. *delicata*, bearing a stout flower-stalk, surmounted with a bead of pale lilac flowers.

Mr. H. Simpkins, gr. to R. J. Measures, Esq., Cambridge Lodge, Camberley, showed a two-flowered *Chrysanthemum* insigne—a bloom of *Cattleya marginata*, with fine markings on sepals and petals; C. *Gaskelliana autumnalis*, and *Lelia prestans rosea*.

Mr. W. Holmes, Frampton Nursery, Hackney, showed a soft rose-coloured Japanese *Chrysanthemum*, *Coquette de Castle*; in the flower and bud, and slightly reflexed—a very large and beautiful flower, and as to colour remarkable.

Mr. W. Bull showed *Lady Avenel*, white and mauve; *Madame Ghys*, of a light mauve; a Japanese *Anemone*, and other *Chrysanthemums*.

Mr. Robert Owen, Boyne Hill Nurseries, Maidenhead, showed cut blooms of various *Chrysanthemums*, reflexed and incurved kinds, and also blooms of the annual *C. marginata*, Cloth of Gold, of pure yellow.

Mr. J. C. Cowley, gr. to E. G. Tautz, Esq., Studley House, Hammer-smith, showed *Cypripedium lowricerubrum* and *C. leucanum superbum*, the latter having superbly developed flowers.

Mr. R. Clarke, florist, Twickenham, staged a neat lot of plants of *Cyclamen* in flower, consisting of his fine strains of crimson, white and crimson, and other colours. A Bronze Banksian Medal was awarded.

Fruit Committee.

Present: T. F. Rivers, Esq., in the chair; and Messrs. II. Veitch, J. Smith, G. Norman, J. Barnett,

G. T. Miles, J. E. Lane, J. Woodbridge, W. Warren, A. Sutton, R. D. Blackmore, II. Weir, P. Crowley.

↑ Messrs. Lane & Son, nurserymen, Great Berkhampstead, showed their Apple Prince Albert, receiving a Cultural Commendation; a similar award was made to Mr. Rouppel for three varieties of Apples.

A seedling Grape, named Miss Clarke, was exhibited by E. Woodall, Esq., of Scarborough, which the committee desired to be examined more fully on another occasion.

Messrs. J. Veitch & Sons, showed Apple Bismarck, and a few miscellaneous items of minor importance were shown.

FIRST-CLASS CERTIFICATES.

To Mr. Head, for *Clerodendron nutans*.
To Mr. Ross, for *Pontederia crassipes* var. *delicata*.
To Messrs. Cannell & Sons, for *Chrysanthemum* La France.

To Messrs. Cannell & Sons, for *Chrysanthemum* (decorative) Admiral Sir T. Symonds.
To Messrs. Cannell & Sons, for *Chrysanthemum* (decorative) Jane.

To Messrs. Cannell & Sons, for *Chrysanthemum* (decorative) Mrs. Cannell.

FIG. 125. DRY ROT: MERILEPS LACHRYANS (USE FIG. 60)

To Mr. Holmes, for *Chrysanthemum* (Japanese) *Coquette de Castle*.

To Sir Trevor Lawrence, for *Angraecum aviculare*.

To G. F. Wilson, Esq., for *Primula capitata* major.

To Messrs. J. Veitch & Sons, for *Chrysanthemum* White Ceres.

To Messrs. J. Veitch & Sons, for *Chrysanthemum* glottosum.

To Messrs. J. Veitch & Sons, for *Chrysanthemum* Phoebeus.

To Messrs. J. Veitch & Sons, for *Amaryllis Lady Mayoress*.

CHRYSANTHEMUM SHOW AT THE CRYSTAL PALACE: Nov. 5 and 6.

PREPARATION was made here for a large display of cut blooms and plants, but the realisation fell somewhat short of the anticipated number of exhibits. We heard of some exhibitors who came and saw but did not stay to cooquer or to be defeated, ignominiously beating a retreat with their intended exhibits. This is hard on the arrangers of shows, who prepare space according to announced demands. With regard to the quality of the blooms we can but repeat that which we stated last week. Most of the incurved varieties are smaller in size than in good years, and the flowers seem in many cases unable to

close up quite fully in the centre. To the general public who are mostly not "kenners" the beautiful and quaint forms and colours of the Japanese and reflexed kinds and refined form of the incurved afford all the gratification that is sought for, leaving to the connoisseurs all discussion as to perfect form and proper size.

The groups were, we think, rather in the way of what we usually find here, and were mostly composed of nicely bloomed plants, chiefly of the Japanese section, although a few consisted of incurved kinds only. The smaller flowered sections, as pompons, and pompon Anemones, were not so numerous, but those that were observed were of the useful dwarf habit, and were quite bouquets of flowers.

CUT FLOWERS.

Forty-eight blooms, twenty-four incurved and twenty-four Japanese.—The 1st prize fell to Mr. Gibson, gr. to J. Wormald, Esq., Morden Park, Mitcham, who had the following in first-class order:—Princess of Wales, two flowers, Golden Queen, Golden Empress, Hero of Stoke Newington, Jennie dore, and Empress of India; the Japanese were Grandiflora, Mrs. Barnett, a fine pale flesh-coloured variety, Comtesse Beauregard, Jeanne Delaux, Val d'Andorre, Thunberg, Elaine, Boule d'Or, Fernand Feral and Baron de Frailly. The 2d prize was taken by Messrs. W. & G. Drover, Fareham, Hants, who had two good flowers of Val d'Andorre, two of J. Delaux, Gloriosum, a beautiful yellow, the colour of Soliel Levant, of which kind a good bloom was also seen in this stand. Mr. J. McKenzie, gr. to F. S. W. Cornwallis, Esq., Luton Park, Midsion, took the 3d prize with large flowers, but wanting in finish; Isabella Bott, a pale flesh-coloured sort, Alfred Salter, Empress of India and Golden Empress were the finest of the stand of incurves, and F. A. Davis was the best Japanese. In the stand taking the 4th prize, Mr. M. Sullivan, gr. to D. B. Chapman, Esq., Downshire House, Roehampton, had two very fine Japanese in Martha Hardy and Mad. de Sevir.

Eighteen incurved varieties, distinct.—Messrs. Drover, Fareham, took the 1st prize, the best flowers being A. Salter, Empress of India, Queen of England, Mr. W. Shipman, Princess of Wales, G. Glenny—small but of good form, Baron Best, Beauty—a fine pale lilac; all were fairly good flowers, but small. Mr. Horsefield, gr. to Lord Ilaytesbury, Ilaytesbury, Wilts, was 2d, the best specimens of the stand being Queen of England, Jeanne d'Arc, Princess of Wales, and Isabella Ward. The 3d prize fell to Mr. Spring-bitt, Holly Nursery, Chessnut, the best blooms being Lord Walseley, John Salter, Mrs. Heale, and Jeanne des Plantes.

Twelve incurved varieties, distinct.—This class, always well contested, brought a good number of competitors, Mr. J. Gore, gr. to Captain Taylor, Glenleigh, Hastings, taking the 1st prize; Golden Empress of India was, perhaps, the finest bloom, but the following were not far behind it:—Princess of Wales, Empress of India, Lord Walseley, Lord Alcester, Novelty (a good French white), Lady Harding, and Hero of Stoke Newington, the remainder being of medium merit. The 2d prize was taken by Mr. J. Wyatt, gr. to J. Percy, Esq., Braddenhurst, Catherham Valley, with a nice stand of evoe blooms, Pink Venus, John Salter, and Nil Desperandum, being the finest.

Six incurved, one variety.—Here Mr. Wyatt took 1st, with a fair-sized well-built flower, the centre well filled, of Lord Walseley.

Eighteen Japanese varieties, distinct.—The 1st prize was awarded to Mr. J. Munro, gr. to Mr. J. Dean Paul, Esq., Cambridge House, Twickenham Meadows; the flowers were nearly up to full size, but were mostly flat on the top; the best were Mr. J. Laing, F. A. Davis, Marguerite Marrouch, Madame B. Renfater, Comte de Germiny, Comtesse Beauregard, Madame C. Audiguer, Val d'Andorre, Baron de Frailly, Criterion, and Bouquet Fait. The 2d prize was taken by Mr. E. Wills, gr. to Mrs. Pearce, The Firs, Bassett, Southampton; Japonaise, Triomphe du Nord, Val d'Andorre, Thunberg, and Madame C. Audiguer, being the finest specimens.

Twelve Japanese varieties, distinct.—This was the warmest contested class, seventeen lots being shown. The 1st prize was awarded to Mr. H. Shoemith, gr. to the Rev. Canon Hodgson, Saltwood Rectory, Hythe, a fine showy collection, consisting of Val d'Andorre, Marguerite Marrouch, Boule d'Or, Mons. Ardeneu, Maiden's Blush, Madame B. Renfater, Fernand Feral, Madame Audiguer, and Mistle, Lacroix, Mr. F. Moore, gr. to Blendon Hall, Bexley, was 2d; in his stand the finest were Mons. Delaux, Thunberg, F. A. Davis, Comtesse Beauregard, and Comte de Germiny.

Twelve Anemone-flowered varieties, not less than eight varieties, or more than two of a sort, Japanese not being admissible.—Mr. Sullivan, Roehampton, took the 1st prize with middle examples; the best of them were Reine des Avelons, of a pretty mauve colour; Glicic, Lady Margaret, a very large one; Marguerite d'Anjou, Fleur de Marie, Georges Sand,

and Empress. There were fifteen competitors in this class.

Twelve reflexed, not less than eight, and not more than two of any variety.—The competition ran very close between the two first competitors, but eventually F. W. Flight, Esq., Conisles, Twyford, was awarded the 1st prize, the fine flowers in his stand being Cullingford, Emperor of China, Madame Tezier, Chevalier Domage, King of Crimsoms, Peach Christine, Dr. Sharp, Cloth of Gold; the 2d going to Mr. Wills, Bassett—Cloth of Gold, Chevalier Domage, Cullingford, Mrs. Forsyth, and Dr. Sharp, being his best specimens entered this class. F. W. Flight, Esq., took the 1st prize for twelve pompons, and Mr. J. Gore that for twelve pompon Anemones.

THE GROUNDS.

The collections arranged for effect on not less than 100 square feet, consisting of incurved varieties only, with pompons permissible as face plants, made a good show; but as far as brilliant colour was concerned, the preference must be given to groups of corresponding dimensions composed of Japanese varieties. All were shown more or less, and contributed largely to the beauty of the show. The groups were formed at salient corners, on either side of the nave.

The competition for six trained specimens was contested by only one person—Mr. Cherry, gr. to Mrs. Gabriel, Norfolk House.

The class for six trained Japanese varieties was competed for by only two persons; and the other remaining minor classes for small numbers of put plants failed to get well responded to.

Some fairly well bloomed Chinese Primulas, red and white, were staged, but call for no comment. Recommendations by Mr. C. Edwards, fine apples by F. W. Smith, Esq., and a few Begonia (tuberous) blooms from Messrs. John Laing & Co., comprised the remainder of the exhibits.

The names of exhibitors not mentioned in the foregoing who took prizes will be found in the annexed list of awards.

CUT FLOWERS (OPEN).

Twelve incurved varieties, distinct.—2d, Mr. J. Wyatt, gr. to J. Perry, Esq., Bradenhead, St. Germain Valley; 3d, Mr. E. S. Cole, gr. to W. Pethick, Esq., J. P., Woodside, Sneyd Park, Bristol.

Six incurved, one variety.—2d, Mr. M. Russell, gr. to Dr. C. F. Lewis, Broomfield, Henfield, Sussex; 3d, Mr. A. Holmes, gr. to A. B. Hill, Esq., South Road, Clapham Park.

Eighteen Japanese varieties, distinct.—3d, Mr. H. W. Ward, gr. to the Right Hon. the Earl of Radnor, Longford Castle, Salisbury.

Twelve Japanese varieties, distinct.—3d, Mr. E. S. Cole, gr. to W. Pethick, Esq., J. P., Woodside, Sneyd Park, Bristol.

Three Japanese, one variety.—1st, Mr. C. Gibson, gr. to J. Wormald, Esq., Morden Park, near Mitcham; 2d, Mr. A. Elphick, gr. to J. Clutton, Esq., The Orchard, Keigate; 3d, Mr. H. Shoemist, gr. to Rev. Canon Hodgson, Saltwood Rectory, Hythe, Kent.

Twelve reflexed, not less than eight varieties or more than two of one sort.—1st, F. W. Flight, Esq., Conisles, Twyford (gr., Mr. W. Neville); 2d, Mr. F. Wills, gr. to Mrs. B. Bage, The Park, Bassett; 3d, Mr. C. Gibson, gr. to J. Wormald, Esq., Morden Park, near Mitcham.

Twelve Anemone-flowered, not less than eight varieties or more than two of one sort, Japanese not admissible.—1st, Mr. M. Sullivan, gr. to D. Chapman, Esq., Downshire House, Richmond; 2d, Mr. F. Moore, The Gardens, Blendon Hall, Bexley; 3d, Mr. C. Fenford, gr. to General Sir F. Fitzwygram, Barr., M.P., Leigh Park, Havant.

Twelve pompon, distinct, three blooms of each.—1st, F. W. Flight, Esq., Conisles, Twyford (gr., Mr. W. Neville); 2d, Mr. G. Durcan, gr. to C. T. Lucas, Esq., Warnham Court, Horsham; 3d, Mr. J. Gore, gr. to Captain Taylor, Glenleigh, near Hastings.

Twelve pompon Anemone, not less than eight varieties or more than two bunches of a sort, three blooms of each.—1st, Mr. J. Gore, gr. to Captain Taylor, Glenleigh, near Hastings; 2d, Mr. J. Howes, Tulse Hill House, Upper Tulse Hill, Brixton; 3d, Mr. E. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill House, Ealing.

Six Japanese Anemone, not less than three varieties or more than two of a sort.—1st, Mr. C. Gibson, gr. to J. Wormald, Esq., Morden Park, near Mitcham; 2d, Messrs. W. & C. Drover, Fareham, Hants; 3d, Mr. H. W. Ward, gr. to the Right Hon. the Earl of Radnor, Longford Castle, Salisbury.

Twelve single, distinct, three blooms of each.—1st, Mr. F. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill House, Ealing; 2d, no competition; 3d, no competition.

POT PLANTS (OPEN).

Collection, arranged for effect, in group not less than 100 square feet, incurved varieties only (may be

facéd with pompon).—1st, Mr. J. Townsend, Providence Nursery, Gardeners' Lane, Putney; 2d, Mr. N. Davis, Camberwell; 3d, Messrs. J. Laing & Co., Stanstead Park, Forest Hill.

Collection, arranged for effect in group not less than 100 square feet, Japanese varieties only (may be facéd with pompon).—1st, Mr. G. Edwards, Baham Nursey, London; 2d, Messrs. J. Laing & Co., Stanstead Park, Forest Hill; 3d, Mr. N. Davis, Camberwell.

AMATEURS.

Collection arranged for effect in group not less than 50 square feet, any sort (amateurs only).—1st Mr. W. Seuster, gr. to Mrs. Croft, Mavis Bank, Grange Road, Upper Norwood; 2d, Mr. J. Howes, Tulse Hill House, Upper Tulse Hill, Brixton; 3d, Mr. F. Ball, gr. to H. Doulton, Esq., The Woodlands, Tooting Common.

Six trained specimens, incurved varieties, distinct, grown in pots not exceeding 12 inches.—1st, Mr. E. Cherry, gr. to Mrs. Gabriel, Norfolk House, Streatham; no other competitor.

Four trained specimens, incurved varieties, distinct, grown in pots not exceeding 12 inches.—1st, Mr. C. Portway, gr. to B. B. Portall, Esq., Davenport House, Upper Tooting; 2d, Mr. G. Kinson, gr. to L. Luders, Esq., Claremont, Alton Park, West Dulwich; 3d, Mr. W. Griffin, Gothic Lodge, Charles Street, Sydenham.

Six trained specimens, Japanese varieties, distinct, grown in pots not exceeding 12 inches.—1st, Mr. A. Tomalin, gr. to G. White, Esq., Oakwood, Crayford, Kent; 2d, Mr. C. Portway, gr. to B. B. Portall, Esq., Davenport House, Upper Tooting.

Four trained specimens, Japanese varieties, distinct, grown in pots not exceeding 12 inches.—1st, no competition; 2d, no competition; 3d, Mr. W. Griffin, Gothic Lodge, Charles Street, Sydenham.

Six trained specimens, pompon varieties, distinct, grown in pots not exceeding 12 inches.—1st, Mr. C. Portway, gr. to B. B. Portall, Esq., Davenport House, Upper Tooting; 2d, withheld; 3d, withheld; extra prize, 2d, Mr. E. Cherry, gr. to Mrs. Gabriel, Norfolk House, Streatham.

Twelve Chinese Primulas, reds.—1st, Mr. J. Rodbourn, gr. to Baroness Heath, Coombe House, Croydon; 2d, withheld; 3d, withheld.

Twelve Chinese Primulas, whites.—1st, Mr. J. Howes, Tulse Hill House, Upper Tulse Hill; 2d, Mr. J. Rodbourn, gr. to Baroness Heath, Coombe House, Croydon; 3d, Mr. J. Little, gr. to D. Link, Esq., Fairlight, The Avenue, Beckenham.

KINGSTON AND SARBITON: Nov 9

and 10.

It is well for this Society that it has so capacious a building as the Drill Hall into which to place its considerable number of exhibits, but if the show continues to grow at its present rate, it is evident that ere other ten years have elapsed some expansion of the Drill Hall will be needed to accommodate it. In every part the staging or floor space allotted to the exhibits was packed and the arrangement so good and effective that as a general rule the exhibitors would not have been excelled. Without exception, the Kingston, if not the largest, yet remains one of the very best and most striking of all our Chrysanthemum exhibitions.

On this occasion Chrysanthemum groups were of very good quality. Trained plants were more than usually numerous and good. Cut flowers were shown in great numbers, and if the incurved kinds lacked the fine quality seen in previous years, at least they were good for the season, whilst the Japanese flowers were exceptionally fine and beautiful.

Fruit, too, was excellent—Apples and Pears always are shown well here; whilst a couple of new classes for black and white Grapes brought good competition and some capital exhibits.

CUT FLOWERS.

The premier class here is that for the Challenge Vase, the present one being the fourth one cleared, and competed for the first time. The absence of Mr. Molyneux, who has won the two previous vases left the competition all the more open, and it was with considerable satisfaction that we saw that capital grower, Mr. Gibson, gr. to J. Wormald, Esq., Morden Park, placed 1st. His twenty-four Japanese blooms comprised good samples of J. Delaux, Criticton, Baron de Prailly, Golden Dragon, Madame Lacroix, grandiflora, Madame C. Andiguiere, Ferdinand Feral, and Meg Merrilies. The best incurred in the twenty-four blooms were Princess of Wales, Empress of India, Golden Empress, Lord Wolsley, Princess Teck, John Salter, Refulgence, and Yellow Perfection. Mr. Coombs, gr. to W. Turke, Esq., Teddington, came 2d, having in Japanese fine Soleil Levant, Boule d'Or, Madame C. Andiguiere, Flamme de Porch, Bouquet Fait, and Rose Poullette. Messrs. W. & G. Drover, Fareham, were a good 3d—a strong posi-

tion out of eight lots in competition, and their stands held many capital flowers. Mr. C. Beckett, Juniper Hill, Dorking, was 4th.

A good class was one for twelve Japanese and twelve incurred, limited to growers within the Poor Law district of Kingston. There were six lots staged, and Mr. W. Smith, gr. to J. F. Schwan, Esq., Wimbledon, was a good 1st, with leading kinds; Mr. G. King, gr. to Mrs. F. E. Esber, was 2d; and Mr. Coombs 3d. In Mr. Smith's stand was a very elegant reflexed, thread peal flower of Madame Andiguiere, showing not only remarkable quality, but also how remarkably the 9' fine kind will vary in form.

Only four 5's were shown in the class for twenty-four incurved blooms. Mr. Coombs coming 1st; Mr. Woodgate, Warden House, Kingston, and Mr. G. Lane, Mayfield, Chesham, were 2d and 3d. The best 11oms in the stands were Jeanne d'Arc, Prince Alfred, Baron Bract, Lord Wolsley, Mrs. Heath, Lady Slade, Princess of Wales, Novely, Irwin des Plantes, Empress of India, and Barbara.

There were fine lots of twelve blooms, Mr. R. Cawte, gr. to J. P. Robinson, Esq., coming 1st; Mr. Thorne, gr. to C. A. Flyver, Esq., Walton, and Mr. Carter, gr. to Alderman Evans, were 2d and 3d. The blooms here were chiefly repetitions of those already named.

Mr. C. Slade, gr. to Lady Rwater, Richmond Park, had the best six blooms, fine but flatish flowers of Golden Queen, Empress of India, Golden Empress, Lord Alcester, Lord Wolsley, and Prince Alfred.

With six blooms of one kind, Golden Empress, like lumps of butter, came from Mr. Munro, Cambridge House, Twickenham; fair Jeanne d'Arc coming 2d and 3d.

An interesting class was that for six blooms, open only to those growers who had not previously taken a prize at the show. There were nine lots staged, the best coming from Mr. C. Lane, Mr. Thorne coming 2d, and Mr. Hawkes, Kingston, 3d; some very good blooms indeed were shown in this class, which was one of great promise.

Turning now to the Japanese classes a remarkably fine lot of 12oms was found in the one for twenty-four, there being no fewer than eight lots. Here Mr. King was 1st, with some grand flowers, including Mad. C. Andiguiere, Criticton, Baron de Prailly, Mons. Astor, Arlequin, Elaine, Val d'Andorre, F. A. Davis, Joseph Mahood, Mrs. Barnett, Middle Lacroix, John Laing, and Soleil Levant, a thoroughly first-rate lot of blooms; Mr. Child, gr. to Mrs. Slade, Claygate, was 2d, having in his stand the Daimio, Alba plene, Mons. N. Davi, a chestnut reflexed flower; Thunberg, and Japonaise, all excellent; Mr. Munro was 3d.

There were nine lots in the class for twelve Japanese.—Mr. W. Smith, Mr. Holden, Esher, and Mr. J. Duncan, Horsham, taking the prizes with excellent flowers.

With six Japanese of one kind Mr. King came 1st with Mad. C. Andiguiere, fairly good.

In the newcomers' class for six Japanese, nine lots being staged, Mr. Waite, Esher, was a good 1st, with some excellent blooms of Comte de Germiny, Elaine, Fanny Blueharlar, Faquet Fait, Mad. K. Rendatier, and Mad. de launay.

Of reflexed flowers there were six stands of a dozen. Mr. Carpenter having the best blooms—all really good—in Cloth of Gold, Chevalier Domage, Mr. Forsyth, Pink and Golden Christine, Dr. Sharpe, and King of Crimsoms; Mr. Coombs was 2d, including in his stand good blooms of his new kind, Amy Furze, King of Crimsoms, and Beauie du Nord; Mr. A. Carter was 3d.

Anemone-flowered kinds were well shown, the best coming from Mr. Gibson, who had capital Fleur de Marie, Lady Margaret, Mrs. Pethers, Acquisition, and Georges Sand.

Only two lots of Japan Anemones were staged, Mr. Child having some superb blooms of Madame Clos, Madame Bertie Pigny, Fabias de Maderanz, Madame Cabrol, and Souvenir Dorothe Souille; Mr. Carpenter was 2d.

Of pompon kinds only one lot was staged in the open class, from Mr. Clark, gr. to A. Nagle, Esq., Kingston—fairly good flowers, in bunches. This falling off in the pretty pompon class is much to be deplored.

With Anemone pompons Mr. Coombs was 1st with good trees of Mr. Astie, Regulus, Madame Montels, Marie Stuart, &c.; Mr. Clark was 2d. There were numerous entries in small local classes, the which do not here call for mention.

Certificates of Merit were awarded to reflexed Amy Fusee, a large, full, almost conical flower, rather paler than Pink Christine, a sort of fawn-white, shown by Mr. Coombs. Also to Messrs. Jackson & Son, for Moonlight, a Japanese which may be well described as a white Madame Andiguiere, and a capital addition to the white Japanese incurved flowers. Also for Ralph Brocklebank, a lemon-coloured sport from Meg Merrilies, but having all the sprawling looseness of that old variety. This was shown by Mr. R. Brocklebank, of Liverpool.

PLANTS IN POTS.

The groups and specimen plants formed a great feature of the exhibition, in several cases the plants being such as are not often seen. There was a large and close competition in the class for the best collection of *Chrysanthemums* to occupy not more than 50 square feet; quality and effect to be the leading features. The groups were of very meritorious productions, especially that of Mr. W. Smith, gr. to J. F. Schwann, Esq., Wimbledon, which received the highest award. The general appearance was one of compactness, each specimen being large, of good form and the colours brilliant. The arrangement was certainly creditable, and great taste was displayed in blending and balancing the colours. There were some fine specimens of Mrs. Dixon and Val d'Andorre. The 2d prize was awarded to Mr. C. Orchard, gr. to W. M. Campbell, Esq., Coombe Ridge, for a group inferior to the 1st only on account of the want of size in many of the flowers, the colours being quite as brilliant as in the former. Mr. H. H. Bitcher, gr. to Mrs. Danage, Sariton, was 3d, his group being weak in the arrangement, the quality good.

Mr. G. King, gr. to Mrs. Fawcett, Esher, had the best six trained incurved specimens, and carried off the premier award in the class with excellent plants, about 5 feet in diameter, all elegantly trained and well flowered, they included five specimens of Mrs. Dixon, John Salter, Lady Hardinge, and George Glenny. Good cultivation was evidenced, and the plants were heavily laden with blooms of good form. The 2d prize fell to Mr. C. Beckett, Juniper Hill, Barking, whose specimens would have looked much better away from those of Mr. King. He had as his finest plants Mrs. Dixon, George Glenny, Prince of Wales, and Mr. G. Rundle. With smaller plants of good quality Mr. H. Trussler, gr. to G. Shand, Esq., took 3d.

In the class for three similar specimens the 1st honours were awarded to Mr. R. Cawte, whose plants of Mrs. G. Rundle, George Glenny, and Mrs. Dixon, especially the last, were very creditable. This exhibitor also had the best single trained specimen incurved, taking the 1st prize with a neatly trained and well flowered Mrs. G. Rundle. With the same variety Mr. King was a close 2d.

Three distinct standards were best shown by Mr. C. Beckett, the varieties being Chinaman, Mrs. G. Rundle, and Mrs. Dixon, all good plants, meriting the award, and far outdistancing their competitors.

In the class for three trained Japanese, there was a close competition between Mr. R. Cawte and Mr. C. Beckett, the highest award eventually being taken by the former exhibitor. In both cases fine plants were shown, bearing a profusion of large, light, and clear blooms. Mr. Cawte's plants were typical *M. Plaine*, and *M. Mme. B. Rendalter*, while those in the 2d prize lot were *M. Leroxi*, *M. Tarin*, and *Chinaman*. Mr. G. King was awarded the 3d prize for creditable examples.

Mr. Cawte and Mr. King were 1st and 2d in the order of their names for a single trained Japanese plant. Mr. Cawte's plant of *Peter the Great* was well flowered but rather too stily trained. The flowers of *La Nymphe*, the plant shown by Mr. King, were not of uniform size, owing to their being so many on the plant.

For six trained specimen pompons, Mr. Cawte was again to the fore, showing remarkably good plants of *Marguerite de Coi*, *Rosinante*, *Miss Nightingale*, and *Adèle Priset*, each one having numerous clear and large flowers; Mr. J. Child, gr. to Mrs. Slade, Claygate, was a close 2d with lightly trained plants, having as his best good samples of *Rosinante*, *Fanny* and *Prince of Orange*; a close 3d was made by Mr. C. Beckett, with not quite so floriferous plants as were shown in the 1st and 2d lots. The plants throughout this class were above the average. This last competitor had the best single trained pompon variety being *Fanny*; the training was light, and the cultivation good. For a good plant, but more stily set up, Mr. Read was 2d; and he also took the highest award in the class for three trained specimens, with well flowered medium sized plants.

There were some plants in pots shown by cottagers, which reflected great merit on the cultivators; they, however, do not call for particular comment.

MISCELLANEOUS.

There was good competition for the prizes offered for a group of miscellaneous plants, arranged for effect, not to exceed 100 square feet. The best group was set up by Mr. G. Fitchell, gr. to G. R. Gaevey, Esq., Twickenham. This was a fine group, very lightly and tastefully arranged; it consisted chiefly of *Crotons*, *Dracenas*, various *Palms*, *Caladiums*, &c., on a light green ground formed by *Adiantums*, the whole being edged by a dark green moss which completely hid the pots, and contrasted with the colour of the Ferns. Additional elegance and lightness was lent by the judicious placing of *Ferics*, *Bouvardias*, *Chrysanthemums*, and a few plants of *Cypripedium*

insigne. Mr. H. Trussler was 2d, for a very similar group, but containing more flowering plants, the arrangement not being so light as in the other. Mr. R. Cawte was 3d, with good plants.

Various decorative plants were well shown, and included *Capsicum*, *Primulas*, *Cyclamen*, &c.

Messrs. Hooper & Co., Twickenham, exhibited a small collection of their winter flowering *Carnations*, which was Commended by the Judges.

FRUIT.

This was well represented, especially as regards Grapes. The best three bunches of black Grapes came from Mr. Griffin, gr. to Miss Chrysty, Coombe Bank; the stand consisted of three fine bunches of Black Alicante, well and evenly finished, and of a good colour. Mr. W. Smith was 2d, with larger bunches of the same variety, but not so well finished; Mr. Dockerill, gr. to G. W. Palmer, Esq., Reading, was 3d, with good small bunches; he was the most successful exhibitor of white Grapes, his *Muscot* of Alexandria being of a rich colour, the bunches and berries large. Mr. Smith was a close 2d with this same variety.

Mr. G. King, gr. to Victoria Road, Putney, showed a basket of *Golden Gros Colmar* (not for competition), which were very large in the berry.

Apples were best shown by Mr. J. W. Reed, his fruit being clean and sound, a very pretty Apple in his collection was *Small's Victoria*, of a rich golden yellow colour.

Mr. Rogers, gr. to S. C. Wilde, Esq., Chesham, received the 1st prize for Pears, his collection of four dishes containing two of cooking Pears. It seemed rather painful that it should have received the award when there were several lots of good dessert Pears as in the 2d prize lot of Mr. Lamb.

NATIONAL CHRYSANTHEMUM SOCIETY: Nov. 10 and 11.

The season for the *Chrysanthemum* in the Home Counties culminated in the very fine show held at the Aquarium, Westminster, on the days named. As a whole the show is one of the largest, if not quite the largest held here, in which the *Chrysanthemum* held the field. We cannot say that more skill is shown this year in the cultivation of the specimens observed in pots, but it must be allowed that the greater numbers of the Japanese varieties shown, and their greater showiness as compared with other kinds, all add much to the brilliancy and interest of the show. The works of distorted art seen in the growing of pompons and others on enormous shields of wire and sticks, and gradually giving way to a more common rather plain, but that it should have received the award when there were several lots of good dessert Pears as in the 2d prize lot of Mr. Lamb.

Cut blooms were not so large as usual, but were, on the whole, of excellent quality. The minor competitions show a decided increase on former years, and the competition in the big classes shows no waning.

The vegetable collections shown were numerous, as were the competing and non-competing classes in fruits, some of the best amateurs and trade growers showing largely.

Grapes in different varieties were plentiful, and comprised some excellent examples, especially of *Gros Colmar* and *Barbarrisa*.

Groups of foliage plants were well represented, and plants for dinner table decoration were conspicuous by their numbers.

POF PLANTS.

Groups of Japanese *Chrysanthemums*, 60 square feet, and not less than twenty varieties.—1st, Mr. G. Edwards, Latham Nurseries, a compactly arranged group, consisting of well bloomed plants of well known kinds, fairly well feathered with foliage, and ranging in height from 3 to 5 feet; 2d, Mr. J. Townsend, Providence Nursery, Gardeners' Lane, Putney, a lot of well flowered plants of from 2 to 6 feet in height, the colours well varied; 3d, Mr. W. Brown, St. Mary's Nursery, Richmond, with plants of greater height than the former, small flowers, leggy, and bare of foliage, but bright with plenty of bloom.

Group of *Chrysanthemums*, Japanese varieties, excluded other conditions similar to those of previous class.—1st, Mr. G. Stevens, nurseryman, Putney, with plants loaded with good bloom, well chosen as to colour, the front of the group well filled with pompon varieties; 2d, Mr. J. Townsend, a group of tall plants, having large well developed flowers and abundant; 3d, Mr. J. W. Wittey, gr. London Cemetery Company, the plants of medium quality only.

Nine trained specimens, large flowered varieties in pots, not exceeding 12 inches.—1st, Mr. Monk, gr. to Mr. W. Fowler, Forest Nursery, Leytonstone, whose plants consisted of Mrs. G. Rundle, J. Salter, Dr. Sharpe, the finest bloomed specimen in the show; Lady Hardinge, Golden G. Glenny, Mrs. G. Glenny,

and Prince of Wales. 2d, Mr. R. Biss, gr. to Miss A. Cotton, The Pastures, Leytonstone, a creditable display, but showing too evidently the art of the trainer. 3d, Mr. J. Weston, gr. to Dr. Martineau, South Road, Clapham Park, whose plants were furnished with very fine large blooms, especially the sorts *Lord Alcester* and *Princess of Wales*.

Four standard trained specimens, large-flowered varieties, in pots not larger than 12 inches.—1st, Mr. J. Mitchell, gr. to Mrs. Arbuthnot, Bogen Place, Bexley, with two tall and two dwarf plants, viz., *Margot*, *Bertier Rendalter*, *Bouquet Fain*, and *G. Glenny*; 2d, Mr. F. Moore, Blandon House, Bexley, the varieties *Jardin des Plantes* and *Mrs. Randle* being the best, the plants being trained as globular-headed standards; 3d, Mr. Gilbey, gr. to B. E. Booth, Esq., The Cazenoves, Upper Clapton—plants of 4 feet in height, and full of flower—*Source d'Or* and *Dr. Macray* being very fine.

Six trained specimens, Japanese, in pots less than 12 inches.—1st, Mr. W. Monk, with *Elaine*, *Tokio*, and *Non. C. Hubert* as his best, at 4 feet in height, and *Mlle. Swin*, *Farwell*, and *Source d'Or* as the lesser-sized plants—all had flower and foliage down to the pot. 2d, Mr. R. Biss, with large pyramids, well finished with bloom, *La Charmeuse* and *L'Esle des Plaisirs* being the choicest; 3d, Messrs. J. & G. Drain, Southgate Nursery, with well flowered plants of but 2 feet in diameter.

Four trained specimens, large-flowered, Japanese or pompons.—2d, Messrs. J. & G. Drain, with plants of best growth, not formally trained, and well finished with foliage and flower.

Six trained specimens, pompons.—1st, Mr. R. E. Reeve, gr. to J. J. Elliott, Esq., Hladley House, Hladley Green, Barnet—splendid specimens of culture, 18 feet in circumference, and well flowered; sorts consisted of *Scour Melaine*, *G. Eden Cedo Nalli*, *Cedo Nalli*, *Fanny*, *Marguerite de Coi*, and *Rose Andromede*. 2d, Mr. P. Gilbey; the best were *Scour Melaine*, *Aurora Borealis*, and *St. Michael*—dwarf trained and well flowered.

AMATEUR CLASSES.—CUT BLOOMS.

For twelve incurved, distinct.—1st, Mr. F. Bingham, 3, Bethune Row, Newington, the first of the stand being *Queen of England*, J. Salter, Empress of India, Lord Wolsley, Golden Empress, Hero of Stoke Newington, Nd Desperandum, Mrs. Rundle, and *Princess of Teck*; 2d, Mr. J. J. Hillier, 13, Percy Road, Wandsworth, whose blooms were symmetrical, but below the others in size.

For six incurved, distinct.—1st, Mr. F. Bingham, a creditable stand, consisting of some of the same varieties as appeared in his class for twelve varieties; 2d, Mr. J. J. Hillier, the blooms of *Mrs. Shipman*, and the fine yellow *Mr. Dunn*, and *Princess of Wales* being very nice.

For twelve Japanese, distinct.—1st, Mr. J. J. Hillier, the best being the new kind—*Glorium*, *Val d'Andorre*, *Dormillon*, *Rosa superba*, and *Boule d'Or*; 2d, G. Walker Esq., 12, Lingford Road, Wimbledon, *Flamme de Punch* and *Marguerite Marouch* being the finest.

For six Japanese, distinct.—1st, Mr. J. J. Hillier; 2d, Mr. G. Jordan, gr. to Rev. H. A. Berners, Harkstead Rectory, Ipswich—both of these competitors staging fair sized blooms.

METROPOLITAN CLASSES.

These are instituted to encourage metropolitan growers, and were the means of bringing many very fair flowers to the show.

For twenty-four incurved, in not fewer than eighteen varieties, or more than two of one variety.—1st, Mr. G. Langlen, gr. to Drs. Minerve and Adams, Brook House, Clapton, with superior well moulded blooms of leading kinds; 2d, Mr. S. Gilbey, also showing good blooms of perfect form, if a little undersized.

For twelve incurved, distinct.—1st, Mr. Langlen; 2d, Mr. Nichol, gr. to W. T. Ogden, Esq., Verandah House, Clapton Common.

For six incurved Mr. S. Gilbey was 1st, A. Salter and J. Salter being fine blooms; Mr. Langlen was 2d.

Twelve Japanese, distinct.—Mr. Gilbey took 1st here with well chosen kinds, somewhat small; and Mr. Davis the 2d.

Mr. Beach, gr. to J. Seligman, Esq., Hereford House, South Kensington, was 1st for six Japanese varieties—good blooms of handsome kinds.

A few groups of Ferns were shown, the 1st prize being taken by Mr. Challis, gr., Albion Lodge, Park Lane, Stoke Newington, ordinary kinds, nicely grown, constituting the group; Mr. Davis, gr. to C. C. Payne, Esq., Cedar House, Stamford Hill, taking also 2d prize in the class for foliage plants.

FRUIT AND VEGETABLES.

Six dishes of dessert Apples, distinct, fit for table.—1st, Mr. G. Duncan, gr. to C. T. Lucas, Esq., Warham Court, Horsham, the sorts shown consisting of *Blenheim Orange*, *Coart Pendu* plant, *Cox's Orange*, *Golden Russet*, *Ribston* and *King of Pippins*,

all very fine highly coloured fruits; 2d, Mr. C. Ross, gr., Welford Park, with Cornish Ardent, very fine and large; Gravenstein, Lady Alice Eyre, a seedling of Mr. Ross' raising, but which, being unripe, lost him the 1st place. 3d, Mr. W. C. Jacobs, Petworth, with varieties exceeding all others in colour.

Six culinary Apples, distinct.—1st, Mr. McKenzie, gr., Linton Court, Maidstone, with Emperor Alexander, Pomona, and Gloria Mundi, being very fine; 2d, Mr. C. Ross, the Mère de Ménage and Stirling Castle being larger than is often seen.

Six dishes dessert Pears, distinct.—1st, Mr. W. Allan, gr. to Lord Suffield, Gunton Park, with fine examples of Marie Louise, M. Louise d'Uccle, Benrèze, Bosc, B. Diel, Glon Moreaux, &c.; 2d, Mr. C. Goldsmith, gr. to Mrs. A. C. Hoare, Kelsey Manor, Beckenham, the Pitman's Duchess and Beurre Clairgaine being large and perfect.

Three bunches of white Grapes.—1st, Mr. J. Roberts, gr. to Messrs. Rothschild, Gungnersbury Park, Acton, with Muscat of Alexandria, solid bunches of a fine amber colour; 2d, Mr. Chalk, gr. to G. Read, Esq., Westwood, Salisbury—the bunches loose and attenuated, colour good.

Three bunches of black Grapes.—1st, Mr. J. Harvey, gr. to J. Waters, Esq., Mrs. Gyns, Featherst, Sussex, with five large-bunched Gros Colmar, fine in colour, but not too large in berry; 2d, Mr. Smith, gr. to W. H. Sewell, Esq., Warren Hill, Loughton, excellent in size of bunch, but wanting a little in colour; 3d, Mr. J. Wing, gr. to — Shepherd, Esq., Rouppel Park, Streatham, with examples that showed good colour and medium-sized berries and bunches.

Collection of Grapes, to consist of twelve bunches, in not less than three varieties.—1st, Mr. J. Harvey, showing three bunches of Barbossa of fine colour, and weighing 14½ lbs.; three of Gros Colmar, of a weight of 12½ lbs.; and three of Black Alcote, of the weight of 11 lb. All of these Grapes possessed every good point, and were much admired. 2d, Mr. J. H. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, showing Black Alicante, Golden Queen, Gros Colmar, with immense berries, and Mrs. Pearson, nice medium-sized bunches; 3d, Mr. W. Allan, whose examples of Mrs. Fince were very creditable.

SPECIAL PRIZES BY MESSRS. WEBB & SONS.

For the best collection of vegetables, six distinct kinds.—1st, Mr. S. Haines, gr. to Lord Radnor, Coleshill House, Highworth; the examples of Wroxton Onion, Student Parsnip, James' Intermediate Carrot, and Autumn Giant Cauliflower were very fine. 2d, Mr. May, gr. to Capt. Le Blanc, Northam House, Barnet, the Lapstone Kidney Potato and May's Brussels Sprouts being amongst his best things; 3d, Mr. Deckett, Cole Hatch Farm, Amersham, the Sutton's Pritzaker Leek and Walker's Exhibition Onion being the finest of the exhibit.

MESSRS. SUTTON & SONS' PRIZES.

For a similar collection.—1st, Mr. C. Waite, gr. to Hon. W. P. Talbot, Glenhurst, Esher, the best being Rousham Park Onion, Sutton's Pritzaker Leek, Perfection Tomato, and New Intermediate Carrot; 2d, Mr. May, with his variety of Brussels Sprouts and others; 3d, Mr. A. Miller, gr. to W. N. Long, Esq., M.P., Rood Ashton Park; 4th, Mr. Haines.

For twelve dishes of Potatoes Mr. E. S. Wills, gr. to R. A. Cartwright, Esq., Edgecote, Babury, took 1st, for clean samples of approved kinds, and Mr. Jacobs a similar award for the best six dishes.

MISCELLANEOUS.

A large collection of Apples was shown, not for competition, by Messrs. G. Bunyard & Co., Maidstone.

Messrs. Sutton & Sons, Reading, showed a collection of a hundred dishes of old varieties of Potatoes, twenty-four dishes of such as are of their introduction, and seven of seedlings under number. Of the latter Nos. 236, a roundish fall, with a suspicion of pink in the eyes; 215, a kidney said to have the true nutty flavour; and 251, a flattish round, of medium size—all of which will appear in commerce next year—are promising kinds.

Messrs. H. Cannell & Sons, Swanley, showed large numbers of Chrysanthemums of all sections, many of them new ones of their raising, also blooms of Begonias; and Mr. N. Davis several new varieties of Chrysanthemums.

Some very charming bouquets of wild and cultivated flowers in a dried state, but retaining perfectly their natural colours, were shown by Mrs. J. Binns, Southam. These bouquets are made flat, and are interspersed with Fern fronds, grass awns, and other slender material, each bouquet being arranged as a vignette within an oval or square frame, the latter, in some instances, appropriately consisting of Fir cones, Oak leafy acorns, &c.

Mr. Robert Owen, nurseryman, Boyne Hill, Maidenhead, exhibited Chrysanthemums of various classes, also C. marginatum.

Mr. W. Holmes showed a group of foliage plants

and Chrysanthemums, receiving a Silver Medal for the same.

Mr. Crute made a large show of his new garden pottery, both of the ornamental and purely useful kinds of it.

Manure-dealers and purveyors of garden requisites of all kinds had several stands.

CUT FLOWERS, INCURRED (OPEN).

The leading class for cut blooms was that for twenty-four incurred, not less than twenty-four varieties, and not more than three blooms of any one variety. In this class Mr. C. Gibson, gr. to J. Wormald, Esq., Morden Park, Surrey, was placed 1st with a lot of blooms decidedly superior to any shown among the eight stands competing in this class, and he was placed 1st, and the award registered. Soon after, it was found that Mr. Gibson had staged four blooms of Golden Queen instead of only three, and he had to be disqualified for what was in reality an unfortunate oversight. He had remarkably fine blooms of Golden Queen, John Salter, Princess of Wales, Hero of Stoke Newington, Nil Desperandum, Barbara, Mrs. Dixon, George Glenny, Princess Beatrice, Jeanne d'Arc, Princess Teck, Golden Eagle, Mabel Ward, Refulgence, and Lord Wolsley. The disqualification of Mr. Gibson resulted in Messrs. W. & G. Drover, nurserymen, Fareham, being placed 1st, and they staged very good blooms of Emily Dale, Lord Wolsley, Queen of England, Alfred Salter, Golden Empress, Mrs. W. Shipman, Nil Desperandum, Hero of Stoke Newington, Lord Alcester, John Salter, Beverley, Prince Alfred, Mabel Ward, Princess of Teck, Princess of Wales, Jardin des Plantes, White Globe, Cherub, Angelina, Lady Hardinge, Baron Beust, and Mrs. Haliburton. 2d, Mr. J. R. Wildman, Oaklands Grove Road, Clapham Park, S.W., with Alfred Salter, Empress of India, Venus, Lady Slade, George Glenny, Lord Alcester, John Salter, Prince of Wales, Prince Alfred, Lord Wolsley, Refulgence, Mr. Bunn, Mrs. Dixon, Golden Beverley, and Antonelli.

In the class for twenty-four incurred varieties, distinct, there were three collections. Mr. J. R. Wildman was placed 1st, with nice and fresh, but rather unequal blooms of Empress of India, Lord Wolsley, Nil Desperandum, Prince Alfred, Guernsey Nugget, Venus, Antonelli, Eve, Barbara, Novelly, Refulgence, Mrs. Dixon, George Glenny, Lady Slade, Mr. Bunn, and Mrs. W. Shipman; 2d, Mr. E. Sanderson, St. Mary's Road, Halesden Park, N.W., with larger and more even blooms, in a few cases a little *passé*. Still many thought they should have won the 1st honours. He had in excellent form Golden Empress, Jeanne d'Arc, Empress of India, Antonelli, Lady Carey, Golden Perfection, Nil Desperandum, Mr. Bunn, Golden Eagle, Captivation, Princess of Teck, and Mr. Brantles.

In the class for eighteen incurred varieties there were two collections, and an exhibitor who at the Royal Aquarium had previously taken a 1st prize for forty-eight, thirty-six, or twenty-four cut blooms of incurred flowers was excluded. The 1st prize went to Mr. J. Martin, gr. to C. N. Kidd, Esq., West Hill House, Dartford, who had in capital form Princess of Wales, Empress of India, Prince Alfred, Golden Empress, Lord Wolsley, Lord Alcester, John Salter, Mr. Brantles, Mrs. W. Shipman, Princess Beatrice, Prince of Wales, Nil Desperandum, Queen of England, 2d, Mr. J. Horsfield, Heytesbury, Wilts, with only just inferior blooms of Queen of England, Empress of India, Lord Alcester, Jeanne d'Arc, Golden Empress, Beverley, White Venus, Baron Beust, Barbara, Lady Hardinge, Mrs. A. Shipman, and Prince Alfred.

In the class for twelve blooms, distinct, there were ten collections, and here Mr. J. Doughty, gr. to Mrs. Tomlin, Angley Park, Cranbrook, Kent, was an admirable 1st, with very fine blooms of Lord Alcester, Empress of India, Golden Empress, Queen of England, Prince Alfred, Jeanne d'Arc, Alfred Salter, Princess of Teck, Hero of Stoke Newington, Mrs. Heale, Mrs. W. Shipman, and Lady Hardinge; 2d, Mr. H. Shoesmith, gr. to the Rev. Canon Hodgson, Saltwood Rectory, Hythe, with Lord Wolsley, Golden Empress, John Salter, Queen of England, Princess of Wales, Jeanne d'Arc, Mrs. Heale, Emily Dale, Hero of Stoke Newington, Cherub, Princess of Teck, and Jardin des Plantes.

Then came a class for six blooms for those who in any previous year had not taken a prize for cut flowers, and as there were fourteen competitors there was evidently no lack of new aspirants to fame. The best came from Mr. D. Hill, gr. to T. D. Brookman, Esq., Bradborough Park, Hythe, Kent, who had very fine blooms of Empress of India, Princess of Wales, John Salter, Princess Teck, Jeanne d'Arc, and Nil Desperandum; 2d, Mr. Howe, gr. to H. Tate, Esq., Park Hill, Streatham, who had Golden Empress, Queen of England, Princess Alexandra, Lord Wolsley, Mr. Brantles, and Prince Alfred; 3d, Mr. J. Philpot, gr. to C. T. Pearson, Esq., Osidge, Southgate.

The class for six blooms of any one variety brought six competitors, and here Mr. J. W. Springbett,

Holly Nursery, Cheshunt, was placed 1st with six faultless blooms of Princess of Wales; Mr. C. J. Salter being 2d with Lord Wolsley, very fine; and Mr. H. Shoesmith 3d, with Empress of India.

CUT FLOWERS: JAPANESE.

These were not only numerous, but so marvellously fine, that visitors clustered about the stands admiring the rich colours and varied forms.

There were ten competitors in the class for forty-eight blooms, not less than twenty-four varieties; and not more than two blooms of any one sort, and here Mr. C. Gibson was 1st with superb examples of Madame Carol, Mlle. Lacroix, Japonaise, Grandiflora, Brno de Prailly, Comtesse de Beauregard, Boule d'Or, Maiden's Blush, Meg Merlees, Glorioso, Jeanne Delaux, Fernand Feral, Thunberg, Roseum pictum, Elaine, Golden Dragon, Mons. Brunet, Val d'Andorre, White Dragon, L'adorable, Comte de Gerniny, Mons. Astorg, Duchess of Albany, Hiver Fleur, Album striatum, and Marguerite Marrouch. 2d, Mr. J. Ridout, gr. to T. B. Hayward, Esq., Woodhatch, Reigate, with very fine examples of Val d'Andorre, Peter the Great, Mons. Ardenne, Mons. Astorg, Grandiflora, Japonaise, John Laing, Criterion, Dormillon, Jeanne Delaux, Marguerite Marrouch, Flamme de Ponce, Madame Rendall, Jupiter, Soleil Levant, Boule d'Or, Fair Maid of Guernsey, Madame de Sevin, Madame Feral, and Mlle. Lacroix.

In the class for twenty-four varieties, distinct, there were seven competitors; and here Mr. J. Child, gr. to Mrs. Slade, Claygate, Esher, was 1st, with a very fine lot of blooms, consisting of Comtesse de Beauregard, Mons. Astorg, Baron de Prailly, Thunberg, Val d'Andorre, Mlle. Lacroix, Galathée, Fair Maid of Guernsey, Fernand Feral, Incomparable, The Daimio, Boule d'Or, Fanny Bonchariat, Mons. F. A. Davis, Mons. Delaux, Duchess of Albany, Japonaise, Album plenum, Hiver Fleur, Madame de Sevin, Peter the Great, Jupiter, and Napoleon; 2d, Mr. H. Shoesmith, with large and well developed blooms of Fernand Feral, Marguerite Marrouch, Madame G. Sand, Bertha Rendall, Hiver Fleur, Fair Maid of Guernsey, Triomphe du Nord, Mons. Ardenne, Golden Dragon, Japonaise, Elaine, Flamme de Ponce, Madame J. Laing, &c.

The best twelve blooms brought fourteen competitors, and they were very good throughout. Mr. Fred. Moore was a good 1st with admirable blooms of Fair Maid of Guernsey, Mons. Astorg, Ceres, Baron de Prailly, Thunberg, Triomphe de la Rue des Châlets, Soleil Levant, Comte de Gerniny, F. A. Davis, John Laing, Criterion, and Mons. Delaux. 2d, Mr. W. R. Strong, Wellington College, with Maiden's Blush, Soleil Levant, Marguerite Marrouch, Meg Merlees, F. A. Davis, Fanny Bonchariat, Belle Poule, &c.

In the class for six white blooms, one variety, Mr. G. Duncan, gr. to Mrs. Lucas, Esq., Warnham Court, Horsham, was 1st, with wonderful flowers of Fair Maid of Guernsey; 2d, Mr. H. Shoesmith, with Mlle. Lacroix; 3d, Mr. J. R. Wildman, with Elaine.

The best six of any other colour were Yellow Dragon, very fine indeed, from Mr. C. Bick, gr. to P. Narborough, Esq., Summerfield House, Elstree; Mr. G. Duncan was 2d with Japonaise; and Mr. H. Shoesmith 3d, with Jeanne Delaux.

In the class for six varieties for those not having in any previous year taken a prize for cut blooms of Chrysanthemums, there were eighteen competitors, and here Mr. C. Bick was 1st with capital blooms of Belle Poule, Mons. Astorg, Madame J. Laing, Mlle. Moulis, Thunberg, and Jeanne Delaux; 2d, Mr. J. Hewitt, gr. to H. B. Mackesson, Esq., Hildiside House, Hythe, Kent, with Madame C. Audigier, Marguerite Marrouch, Grandiflora, Triomphe de la Rue des Châlets, L'adorable, and Mons. Ardenne.

Mr. G. Stevens, St. John's Nursery, Putney, offered special prizes for the best six blooms of Chrysanthemum, Maiden's Blush, and here Mr. P. Sadler, gr. to C. Lambert, Esq., Oak Hill Place, Streatham, was 1st with some excellent flowers; Messrs. W. & G. Drover, Fareham, being 2d; and Mr. J. Wright, Middle Temple Gardens, 3d.

REFLEXED CHRYSANTHEMUMS.

In the class for twelve bloom, not more than two varieties of each variety, there were seven competitors, and some charming blooms were staged; the best stand came from Mr. F. Moore, gr. to W. C. Ekershill, Esq., Blenden Hall, Bexley, who had very fine Hugh, Christine, Golden Christine, Felicity, Cullingford, very fine; Dr. Sharpe, and Phidias; 2d, Mr. E. Wills, with Cloth of Gold, Mrs. Forsyth, King of Crimons, Chevalier Dmoage, Cullingford, and Phidias.

ANEMONE-FLOWERED CHRYSANTHEMUMS.

In the class for twelve, large-flowered varieties, Japanese forms excluded, Mr. F. Moore was

1st with Laing's Anemone, very fine; Acquisition, Mrs. Pethers, Lady Margaret, Fleur de Marie, King of Anemones, Glück, Minnie Chate (?), Sunflower, Empress, Princess Louise, and Georges Sand. A protest was entered against the 1st prize being awarded to this stand, on the ground that it contained a bloom of double Chate, a Japanese variety, but it was overruled by the judges, on the ground that they were not at all certain that it was the variety named. 2d, Mr. Sullivan, gr. to D. E. Chapman, Esq., Dowanite House, Roehampton, with fine blooms of Lady Margaret, Mrs. Pethers, Fleur de Marie, Glück, Laing's Anemone, Georges Sand, Empress, and Prince of Anemones.

There were three stands only of six blooms of Japanese Anemone-flowered varieties, not less than three varieties, and here Mr. J. J. Hillier, 43, Priory Road, Wandsworth Road, was 1st with Triomphe du Nord, Katapil, Madame Cabrol, Madame Clos, and Sœur Dorothe Souille; 2d, Mr. A. Ives, with Madame Berthé Pigny, Minnie Chate, Sœur Dorothe Souille, Duchess of Edinburgh, and Souvenir de l'Ardenne.

There were six collections of Anemone-flowered pointers, three flowers in a bunch, and here Mr. R. Whitty was 1st, Regulus, Mrs. Wynne, Astoria, Miss Nightingale, Antonius, Madame Chalonge, Rose Marguerite, Magenta King, Astrea, Mons. Astie, Perle, Marguerite du Coi. 2d, Mr. M. Butcher, gr. to W. G. Cousins, Esq., The Priory, Hadley, with a very good lot also, but owing to the deficient light they were unable to obtain the same.

POMPON CHRYSANTHEMUMS.

Shown in stands of twelve bunches, three flowers forming a bunch, these were very pretty in bed, and the stands competed. The best came from Mr. J. Gore, who had Black Douglas, Toussaint Marriot, President Frey, Marabout, Prince of Orange, Golden Mlle Marthe, Adele Presette, Mons. Hoste, Glück, Mlle. Marthe, and Madame Victor. 2d, Mr. Butcher, with Golden Mlle. Marthe, Fimbriatum, St. Michael, Prince of Orange, President, Sœur Melaine, Adonis, La Vogue, Charles Drake's, Marabout, Cendrillon, and Mlle. Marthe.

NEW CHRYSANTHEMUMS.

A Silver Medal was offered for the best stand of two blooms of new Chrysanthemum, in 1886, not less than six distinct varieties, and this was awarded to Mr. G. Stevens, St. John's Nursery, Putney, who had, in good form, Maiden's Blush, Madame la Marquise de Mun, John Stevens, St. d'Angele Amiel, Lady Matheson, Mlle. Marie Clos, and William Stevens, all Japanese varieties. Five other stands competed.

A large number of these were submitted to the Floral Committee of the National Chrysanthemum Society during the day, E. Sanderson, Esq., President, presiding.

First-class Certificates of Merit were awarded to Mr. F. A. Davis, Chrysanthemum Nursery, Camberwell, for hybrid pompon Sanspareil, golden-bronze with lemon centre, large and good shape, with broad petals and a distinct incurved form; pompon Seapen, pale chestnut flushed with magenta, large, full, and somewhat reflexed; Japanese Snowstorm, a white variety with a few red veins; the Great, slight sulphur centre, large and full, appears a new decorative variety; also to Mr. Ives, gr. to E. C. Jukes, Esq., for the same; for Anemone-flowered La Marguerite, purplish-magenta with golden centre, good colour and shape; and Cressus and Chardonnet, two reflexed varieties with handsome fimbriated petals, appearing as if they were the commencement of a new race—the former pale chocolate-brown with yellow centre, the latter dull red-rose-purple. The same award was made to Mr. Jones, nurseryman, Lewisham, for Mrs. H. J. Jones, a golden spott from the Japanese, Ethel, the flowers pale gold, and very handsome. To Messrs. Henry Cannell & Sons, nurserymen, Swanley, for hybrid pompon Egyptian Gem, light magenta-purple, full, and of excellent form; and Japanese Anemone Katapil, reddish-brown, with orange centre, distinct and good. To Mr. William Holmes, Hackney, for Japanese Conquete de Castle, delicate pink, dwarf in growth, very pretty as a decorative variety. To Messrs. James Veitch & Sons, Royal Exotic Nurseries, King's Road Chelsea, for reflexed Chrysanthemum, Madame Vivand Morel, very like a Dahlia, with broad white petals, and a sulphur centre; to St. Angele Amiel, a white Japanese, with full flowers of narrow petals; and Paul Dutoit, white, with lilac base—a beautiful Japanese variety.

The following were Commended—1—Pompon Osiris, pink, tipping with cream, and pale golden centre, good shape, and very pleasing. Mr. Wright, Temple Gardens; and Hybrid pompon Aureole, soft pinkish-lilac, with large reflexed flowers—from T. S. Ware; Mrs. Cannell, an incurved Japanese ivory-white, with sulphur centre—from Messrs. H. Cannell & Sons, which the committee would like to see again. The best arranged epergne of single or semi-single Chrysanthemums came from Mr. W. Brown, St.

Mary's Grove Nursery, Richmond; 2d, Mr. E. Chadwick, gr. to E. M. Nelson, Esq., Ealing; and 3d, Mr. H. J. Jones, Hope Nursery, Lewisham.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, NOVEMBER 10, 1886.

MANCHESTER HORTICULTURAL IMPROVEMENT SOCIETY.

The annual meeting of the Manchester Horticultural Improvement Society was held on Thursday, Nov. 4, in the Memorial Hall, Albert Square. Mr. Bruce Findlay, the President, was in the chair.

Mr. Robert Tait, the honorary treasurer, submitted his financial statement for the past year. He was pleased to find the Society had a small balance, and he hoped the new session would end with a larger amount than it had now.

The statement was adopted by the meeting. Mr. Bruce Findlay was unanimously re-elected President for the coming year; Mr. Robert Tait, treasurer; Mr. W. B. Uppohn, honorary secretary; and the following gentlemen again form the committee of the Society: Messrs. William F. Briddell, J. F. Robinson, J. S. Butterworth, and E. G. Hughes.

The President then delivered an address. He took as his subject Horticulture, which, he said, whether regarded as an art, a science, pursuit, or a profession, now occupies more of the attention of the educated classes than at any previous period. Horticulture is the parent of agriculture inasmuch as it determines on a small scale the value of those principles upon which a more extended cultivation of the soil depends. It essentially consists in subjecting living organisms to the wants, tastes, and caprices of man, who obliges the plant he wants, or admires in its natural condition, to live where he pleases, however far from its native haunts; and who requires the plant which he does not want or admire in that condition to change its form, colour, or habits, and assume such as will render it valuable to him or beautiful in his eyes.

The tendency to produce a variable offspring is inherent in the constitution of every plant, and is indeed a necessity of its existence. There is no such thing as an absolute repetition of the parent in the progeny. Nature supplies the gardener with varieties, and all he can do is to exert his skill in deciding which of them is best suited to his wants, again selecting from its progeny which is still better suited, and so on till his wants are satisfied. It is to this inherent power of variation and its apparent universality that the attention of horticulturists is now directed in a very marked manner. Every gardener knows how difficult it is to keep the progeny true to its parents, that the same garden variety does not originate in two independent nurseries, and that the race of a plant raised in Belgium differs from the race of the same plant raised in France, Holland, or England. There can be no doubt that vegetables as well as animals and plants are liable to an almost unlimited diversification, regulated by climate, soil, nourishment, and new mixtures of already formed varieties. Mr. Findlay referred briefly to the state of horticulture at the present time in this country. He could go back for a period of thirty-five years, and he was bound to say that in some branches of plant culture little or no progress has been made. Where are the magnificent collections of Cape Clapham that used to be exhibited by Fairbairn of Clapham, Kollinson of Tooping, Bancroft of Exeter, and Barrow of Camberwell? They are not to be met with in these days. Where are the magnificent specimen Azaleas that used to be the glory of our exhibitions? They do not exist. Then, again, there were the New Holland plants formerly shown by Mrs. Lawrence of Easing Park, Mr. Collier of Dartford, and several other exhibitors. One seldom sees well-grown specimens of this class of plant now. One reason for this is, that the attention of gardeners has been directed into other channels, and another, no doubt, is that, owing to the commercial-depression, the class of plants to which he referred have not received that special attention accorded to them in former days. He believed on the whole that horticulture has made rapid strides in this country during the past fifty years. Next year is the jubilee year of the Queen's reign, and a paper on the progress of horticulture during that period would be a subject pregnant with interest. He hoped that the subject would be taken up by some member of the Society.

By a vote of thanks was passed to the President for his address.

Obituary.

MR. THOMAS GIBBS.—It is with deep regret we have to announce the sudden death of Mr. Thomas Gibbs, head of the well known firm, Thomas Gibbs & Co., Seedsmen by Royal Warrant to Her Majesty the Queen, and by appointment (April 3, 1844), to the Royal Agricultural Society of England. The deceased was but fifty-eight years of age, and within an hour of his death was in his usual health. He will be succeeded in the business by his only son, Mr. Arthur Gibbs.

- Nov. 4.—Fine and bright; cloudy night.
- 5.—Wet and generally overcast; fine night.
- 6.—Rough and stormy day, with frequent squalls.
- 7.—Mist in early morning; generally overcast.
- 8.—Fine and bright throughout.
- 9.—Fine till 11 a.m., wet and dull afterwards.
- 10.—Rain till afternoon, fine but dull afterwards.

LONDON: Atmospheric Pressure.—During the week ending November 6, the reading of the barometer at the level of the sea decreased from 30.16 inches at the beginning of the week, to 30.07 inches by the afternoon of November 1, increased to 30.33 inches by the morning of the 3d, decreased to 29.87 inches by 1 P.M. on the 4th, increased to 29.90 inches by the afternoon of the same day, decreased to 28.97 inches by the morning of the 6th, and was 29.26 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.83 inches, being 0.34 inch lower than last week, and 0.13 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 61° S. on October 31; the highest on November 6 was 46°. The mean of the seven high day temperatures was 54° 5'.

The lowest in the week was 33° S. on November 3 and 6; the lowest on November 1 was 51° 2'. The mean of the seven low night temperatures was 43° 1'.

The greatest range of temperature in one day was 16° S. on November 3; the smallest was 7° 3' on the 1st. The mean of the seven daily ranges was 11° 4'.

The mean daily temperatures were 55° 3' on October 31, 54° 3' on November 1, 50° 9' on the 2d, 45° 9' on the 3d, 45° 8' on the 4th, 49° 5' on the 5th, and 41° 5' on the 6th. These were well above their averages with the exception of the 6th, which was 0° 6' below, by 8° 9', 8° 1', 4° 9', 0° 1', 0° 2', and 1° 1' respectively.

The mean temperature of the week was 49°, being 0° 7' lower than last week, and 3° 2' above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 104° 5' on November 4. The mean of the seven readings was 72° 8'.

Rain.—Rain fell on five days to the amount of 1.20 inch.

ENGLAND: Temperature.—During the week ending November 6, the highest temperature was 61° 8' at Blackhead, 61° 5' at Cambridge, and 60° at Truro, Sheffield, and Leeds; the highest at Newcastle was 55°, at Liverpool 50° 9', and at Sunderland and Preston 57°. The general mean was 58° 9'.

The lowest in the week were at Wolverhampton 52° 5', at Nottingham 33°, and at Truro and Sheffield 35°; and the lowest at Brighton was 40° S. at Preston and Newcastle 40°. The general mean was 37° 2'. The greatest ranges of temperature were at Nottingham 26° 5', at Wolverhampton 26° 1', and at Cambridge 25° 5'; the least ranges were at Newcastle 15°, Preston 17°, and at Liverpool 17° 7'. The general mean was 21° 7'.

The mean of the seven high day temperatures was highest at Truro and Plymouth 56° and at Leeds 55° 2'; and lowest at Newcastle 51° 1', and at Sheffield and Sunderland 51° S. The general mean was 53° 7'.

The mean of the seven low night temperatures were highest at Brighton, 46° 9', at Plymouth, 46°, and at

Truro and Bristol 44°.4; and were lowest at Wolverhampton, 38°.7, at Hull 40°.6, and at Sunderland 41°.7. The general mean was 43°.1.

The mean daily range was greatest at Wolverhampton, 14°.7, and at Nottingham and Leeds 12°.4; and least at Brighton, 7°.9, at Preston 8°.2, and at Newcastle 8°.6. The general mean was 10°.6.

The mean temperature was highest at Plymouth, 50°.4, at Brighton 50°.2, and at Truro 49°.5; and was lowest at Wolverhampton, 45°.3, at Hull 45°.9, and at Sunderland 46°.7. The general mean was 47°.8.

AINN.—The latest falls were 2.39 inches at Sunderland, 2.18 inches at Truro, and 2.14 inches at Liverpool; the smallest falls were .43 inch at Sheffield, .50 inch at Nottingham, and .80 inch at Cambridge. The general mean fall was 1.34 inch.

SCOTLAND: Temperature.—During the week ending November 6th, the highest temperature was 50° at Perth; the highest at Edinburgh was 53°.5. The general mean was 56°.

The lowest temperature in the week was 31°.5 at Perth; the lowest at Paisley was 37°.8. The general mean was 35°.7.

The mean temperature was highest at Greenock, 47°.4; and lowest at Dundee, 44°.9. The general mean was 46°.5.

JAMES GLAISHER, F.R.S.

Errata (in week ending October 30).—The general mean greatest ranges of temperature, for 53°.8 read 16°.7; and the general mean daily range of temperature, for 6°.5 read 7°.8.

Enquiries.

"He that questioneth much shall learn much."—BACON.

HAUTOBUS STRAWBERRY.—Can any of the readers of the Gardeners' Chronicle inform me if the old-fashioned unutilised Hautobus Strawberry is still in cultivation; if so, where it can be had? There is one variety here, but not what is wanted. It is of a greenish-grey colour when ripe, and very little flavour with it. The name of it is not known here. P. J. B.

Answers to Correspondents.

NOTICE.—Owing to pressure on our space several reports of Chrysanthemum Shows are deferred till next week.

ADDRESS OF MR. R. CUTLER, SECRETARY TO THE GARDENERS' ROYAL BENEVOLENT INSTITUTION: J. C. No. 50, Parliament Street, Westminster, London, S.W.

BOOKS: W. M. Mushrooms for the Million, by J. Wright, published at the office of the Journal of Horticulture, 171, Fleet Street. Price 1s.—Y. Darwin on Movements of Plants, and on Insectivorous Plants, are to be had from John Murray, Albemarle Street.

BROCCOLI: W. W. The name of the place where the photograph came was so indistinctly written that we must be pardoned for making the mistake in the spelling of it.

CHRYSANTHEMUMS MRS. FORSYTH AND CULLINGFORD: Enquirer. According to the National Chrysanthemum Society's ruling, these are reflex varieties.

CINERARIAS ROTTING: A. Z. The decay may be caused by over-rich soil combined with too much water. We noted the drainage of the pots might have been better; and a little sowing of sulphur and powdered charcoal, dusting the plants round about their base, and do not let the stream of water, when watering them, strike the rootstock, but pour the water at the side of the pot.

CORAL PLANT: W. M. P. & Co. Several plants go under this name, but we think you mean the Coral-reef, a variety of which (Crista galli) is used in sub-tropical and other styles of bed planting.

ERGOI: C. P. This is caused by a fungus which attacks the grain. It is a poison to cattle and to human beings if taken in quantities. We do not know how to prevent it, but all the specimens that can be got at should be burned.

EUCHARIS: G. F. W. Name from eu, something special; and charis, charm. The proper name is E. grandiflora. It is a native of New Granada, where it was originally discovered by M. Triana. It was first described by Messrs. Planchon and Linden in vol. ix. of the Flore des Serres. See Gardeners' Chronicle, December 8, 1855, p. 804.

GALLS OF ABIES NORBILI: T. These are the result of the attack of a cocculus-like insect, akin to that which produces American Blight on Apples. You will find an account, with figures in our number for July 22, 1882, p. 109. Paraffine emulsion applied with a spray-producer will kill the insect.

HERBACEOUS NO-O? J. C. The Iberis of which you send such fine flowering specimens is certainly not a herbaceous plant.

INSECT: J. T. Next week.

NAMES OF PLANTS: H. W. 1, Asplenium Trichomanes; 2, A. Cystopteris, probably C. fragilis; but the specimen is not in condition for a herbaceous plant. Its Trietris hirta.—A. S. M., An Sclanum, but we do not know the species.—A. W., Escher, Cotoneaster frigidula.—R. E. H. Probably Aceris virens.—F. T. A pale form of Cattleya Gaskelliana; will probably develop into a good thing.—A. B., A very distinct and pretty variety of Odontoglossum crispum.—J. H. M., Cyprripedium javanicum, Coleogyne fimbriata.—A. C., Odontoglossum tripudians.—R. K. H., A very fine specimen indeed of Lælia autumnalis var. atro rubens. The Cymbidium is C. Martiana.—O. J., A variety of Ficus edulis. A native of New Caledonia.

LELIA CRISTA—LEAF DISEASED: J. H. Probably caused by excessive moisture, and little air.

MEALY BUG ON VINES: Old Subscriber. You may get rid of it by using the paraffine emulsion on the Vines in winter, washing all the woodwork, walls, &c. with the same; and shovelling out the top soil. Then paint the woodwork and limewash the walls. Use methylated spirits in the summer time if bug should appear.

ROSES TO GROW OUT-OF-DOORS FOR MARKET: Viridis. The following, or any of them, could be used for the purpose in the South, but the Teas would not be suitable north of York.—Anna Alexieff, H.P.; Beauty of Waltham, H.P.; Celine Forestier, Noiset; Charles Lawson, H.P.; Desvossis, Tea; Général Jacquemin, H.P.; Gloire de Dijon, Tea; Hortense, Tea; La Boule d'Or, Tea; La France, H.P.; Souvenir de la Malmaison, B.; Madame Falcot, Tea (fine bud); Maréchal Niel, T.N.; Marie Baumann, H.P.; A. K. Williams, H.P.; Captain Christy, Wood; Niphotes, Tea (the best white); Mrs. C. Wood, H.P.; Marshall Prevost, H.P.; Senateur Vaisse, H.P.; Victor Verdier, H.P.; Marie Ducher, Tea; and Innocente Pirola, Tea.

COMMUNICATIONS RECEIVED.—J. Carter & Co., T. I.; E. H. J. Cooke, T. W. S. W.; J. J. F. W. S. W.; Wilkinson—N. E. B.—W. S. W. J. J. D.—H. J. R.—J. L. A. D. W. J. V. & Sons—T. F. W. E. H. T. W.—W. E. W.—Subscriber.—H. K. W. F. (next week)—William Whitt. Force Ironstone, Birmingham.

RICHARD SMITH & CO., WORCESTER.

Extract from the "Lady's Pictorial" of 23d Oct., 1886.

"Most of our readers are already familiar with the beauty and merit of the **Darlington Dress Fabrics** Manufactured by Messrs. **HENRY PEASE & Co.'s Successors, at the Mills, Darlington.**

"The Novel Patterns and Designs especially prepared for the present season are exceptionally successful, both as regards colour and texture, and we can thoroughly recom-

vince our readers that they deserve the highest praise.

"It is impossible to over-estimate the immense advantages of obtaining goods in this manner direct from the original manufacturers, since there remains literally only one man, and therefore only one profit, between the wool-producing animal and the person who eventually wears the woollen goods. Where there is only one profit to be made, as in this case, it is clearly evident that the purchaser must benefit largely, since there is no middle man to swallow up the intermediate gains. This being so, our readers will do well to make the most of their opportunity, and write at once for Patterns, which are naturally greatly in demand at the present season of the year.

"We must mention as specially appropriate just now the Darlington Cross-warp Serges, the all-wool *foules*, and the Gold Medal Cashmeres, for these materials, together with all the other Darlington Dress Fabrics, are fine and soft in texture, artistic in colouring, and entirely novel in design."

mend these goods to the notice of our readers as being entirely suitable for autumn and winter wear. Large Boxes of Patterns will be sent immediately upon application at the above address, and the novelty and beauty of the fabrics will quickly con-

HENRY PEASE & CO.'S SUCCESSORS, DARLINGTON. [Established in 1752.]

All Parcels are Carriage Paid, and any Article can be Changed within Seven Days.

Boulton & Paul, Horticultural Builders, Norwich.

Boulton & Paul's CUCUMBER FRAMES are always in stock, ready to be sent away on receipt of order. They are made of best, sound, red deal, sawn from the best trees in the forest to our special requirements, and seasoned in a proper manner. The **FRAMES** are of 1½ in. boards, 24 in. high in front, bolted at the corners, and easily taken to pieces if required. The **LIGHTS** are 2 in. thick, with iron bar across and one handle at the top, and the whole painted four coats. The **Glass** is ENGLISH, 21-oz. weight. **PACKED** and sent, **CARRIAGE PAID**, to any station in England and Wales, to Dublin, Belfast, Londonderry, Cork, Glasgow, and stations equivalent. Cases are allowed in full when returned.

FAWKES' Slow-combustion HEATING APPARATUS.
—Most efficient and cheapest in existence. Requires no sunk stokehole and no brick setting. Will last all night without attention. Will burn house cinders, therefore costs next to nothing for fuel. Any one can fix it. A domestic servant can stoke it.

Boilers Delivered and Carriage Paid FROM £2 10s

Numbers in use all over the country.
Only Slow Combustion Apparatus of the kind.

Beware of inefficient incomplete apparatus which will not last all night.

Full particulars and Prices of every sized Apparatus, and numerous Testimonials for last three seasons, showing enormous success, sent free on application.

CROMPTON & FAWKES,
CHELMSFORD.

THE LOUGHBROUGH GREENHOUSE HOT-WATER APPARATUS.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stoke-hole, and no hot-water filter for fixing. The Boiler stands in the Greenhouse, the front only being outside, so that the whole of the heat from the Boiler itself is utilised. It burns over twelve hours with ut attention, at a nominal cost.

Price, as engraving, with Boiler, open feed system, 12 feet of 4-inch hot-water pipe, and patent 1/2 inch complete, £4 4s. Delivered free to any station. Discount for cash. Cost of apparatus complete for Greenhouses as below, delivered free with pipes cut and fitted ready for fixing—
10 x 6 feet .. £4 14 0 20 x 10 feet .. £7 0 0
12 x 8 feet .. 5 1 0 25 x 12 feet .. 12 6 8

JAMES T. ANDERSON, 149, Commercial Street, London, E.

HILL and SMITH'S BLACK VARNISH
for Preserving Ironwork, Wood, or Stone.

Oil Paint no Longer Necessary.
This VARNISH is an excellent substitute for oil paint for any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used to the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manuactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
From ALBERT LOWE, Esq., *The Rectory, Albury Lodge.*
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.
Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.
Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

Send your Name and Address, and mention this paper, and receive, per return, postage, sample and particulars of

SMITH'S-COLCHESTER

LIVE-LONG CANDY, THE BEST DIGESTIVE.

No household should be without this valuable and Palatable Stimulant so highly spoken of by the great Duke of Wellington. A small piece taken after a meal has an insalubrious effectual PREVENTIVE effect against INDIGESTION, Heaviness or Burning on the Chest and Fulness after Meals; or, taken at bedtime, by its warmth-giving and Stomachic properties, PROMOTES SLEEP. A small piece dissolved in the mouth when exposed to damp and cold, WARMS the GIBBET, and prevents those injuries which arise from Chills. It is invaluable to all SPASMATICS, and is recommended by the Duchess of Beaufort, the Marquis of Waterford, &c. Price, 1s. 6d., 2s. 6d., and 4s. 6d. of all Chemists. Be careful to buy SMITH'S-COLCHESTER LIVE-LONG CANDY, PREPARED BY

THE GREAT DUKE OF WELLINGTON RECOMMENDING SMITH'S-COLCHESTER LIVE-LONG CANDY.

SHENSTONE (Late Smith & Shenstone), CHEMIST, COLCHESTER, &c. Cheapest prices of WATSON and SCULL, 90, Lower Thames St., London, E.C. To Nurserymen, Seed Merchants, and Florists. J. BLACKBURN and SONS are offering J. Archangel MATS lower than any other house in the Trade. Also Petersburg MATS and MAT BAGS, RAFFIA FIBRE, TOBACCO PAPER, and Shading Materials. Prices free on application.—4 and 5, Wormwood Street, London, E.C.

BEESON'S MANURE is the best for all Horticultural Purposes. Sold in tins, 1s. 2s. 6d., 5s. 6d., and 10s. 6d. or cwt. bags, sealed, 12s. each. By all Nurserymen or Seedsmen, or direct from Carlrook Bone Mills, Sheffield. Also pure CRUSHED UNBOILED BONES, any size, and guaranteed of the best quality. PEAT and SAND.—Light Brown PEAT for Nursery and Greenhouse Work, in four ton trucks of 10 yards each, at ros. per yard. In bags, at 2s. 6d. per bag. Rhododendron and American Plant Beds, at 15s. per ton. Orchid Peat 2s. per bag; Fresh SPHAGNUM, ros. 6d. per bag. SILVER SAND, coarse or fine, 12s. per ton. WALKER and CO., (Farboro' Station, Hants.

K E L P — K E L P — K E L P — This powerful and stimulating Ash, made from the sundried plants of Laminaria digitata and other selected seaweeds, is especially rich in Potash, and Phosphoric Acid. Mixed with three times its bulk of dry soil, its effect on Vine Orders, Tomato Plants, and nearly all Pot Plants, is marked and beneficial, while no better dressing exists for Potatoes, Peas, Strawberries, and Celery. It is an excellent Renovator for Old Garden Soil, and exhausted and Moss-grown Lawns. Price (for cash with order only), 8s. per bushel bag, bag included. Cheap through rates 2/6 Southampton or Weymouth. J. E. FERRY, La Poudreterie, St. Martin's, Jersey. N.B.—The Seeds of the Sundried Plants can only be harvested during the spring tides of the four summer months, and then at some distance from the mainland, the supply is necessarily limited, and Orders will therefore be executed in strict rotation.

E P P S'S SELECTED PEAT AND GARDEN REQUISITES.

WANTED, a sharp active young MAN, for a Seed and Florist's Establishment—one with a few years' experience, another with none.—State age and salary required to THOMAS HORSMAN, Ilkley.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 43, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

SCOTCH GARDENERS.

—JOHN DOWNIE, Seedsman, 144, Pines Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engage-ments. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

TO FLORISTS, or FRUITERS and GARDENERS.—A young man, as above. Thoroughly experienced. Good references.—T. C., 5, High Street, Kensington, W.

HOLLOWAY'S PILLS.—Wrong made Right.—Every day that any bodily suffering is permitted to continue renders the system liable to become chronic or dangerous. Holloway's purifying, cooling, and strengthening Pills are well adapted for any irregularity of the human body, and should be taken when the stomach is disordered, the liver deranged, the kidneys inactive, the bowels torpid, or the brain muddled. With this medicine every invalid can cure himself, and those who are weak and infirm through imperfect digestion may make themselves strong and stout by Holloway's excellent Pills. A few doses of them usually mitigate the most painful symptoms caused by unclean food, from which they thoroughly free the alimentary canal, and completely restore its natural power and action.

FOSTER & PEARSON, HORTICULTURAL BUILDERS, BEESTON, NOTTS.

THE "CHILWELL NURSERIES" BOILER
REGISTERED

EXPLANATION
 WATER PASSES THROUGH THE RETURN PIPE INTO THE BOX A, THENCE THROUGH PIPES BBBB TO BOX C, THENCE THROUGH PIPES DD TO BOX E, THENCE THROUGH PIPES FFFF, FFF TO BOXES H, THENCE THROUGH PIPES IIII TO BOXES KK AND THENCE INTO BOX L.

THE BEST BOILER FOR GREENHOUSES.

WHAT THE NURSERYMEN SAY:-

From Messrs J. R. PEARSON & SONS, Chilwell Nurseries, Notts.

"The 'Chilwell Boiler' has given us amplified satisfaction from the first, being the most powerful and economical we have yet tried. The draught is so good that we can burn any kind of fuel, and get up the heat in less time than with any other boiler, while it is at the same time under perfect control."

From Mr. EDWIN COOLING, Mile Ash Nurseries, Derby.

"I am very pleased with the new Boiler. It does its work admirably, and heats the water in less time than any boiler I have ever had. Your boiler is doing the work of ten fires, and doing it much better, with less than a quarter of the labour in stoking. It has been severely tested during the late hard weather, and proved

quite equal to its work. We find it easy to manage, quick in its action, and very economical."

N.B.—This is a 12-foot Boiler, heating 5000 feet of 4-inch pipe.

From Messrs. W. BARRON & SON, Elvaston Nurseries, Derby.

"The 12-foot Chilwell Nurseries Boiler is very satisfactory. It heats seven houses, containing 3000 feet of pipe, which formerly required three boilers, thus effecting a considerable saving in labour and fuel. The water heats and circulates much more quickly than from a saddle boiler, and the fire can be banked and left for hours without further attention. During the late severe weather we have never touched the fire between 10 P.M. and 10 A.M."

SPAN FRAME on Iron Standards, 5 feet wide.

ONE GOLD, THREE SILVER
MEDALS,
LIVERPOOL SHOW,
All First Prizes.

The "LIVERPOOL" BOILER.

Price Lists on application.

RICHARD SMITH & CO.,
NURSERYMEN AND SEED MERCHANTS,
WORCESTER.

BAUMFORTH'S SEEDLING RASPBERRY.

THIS new and splendid Raspberry has now so thoroughly established itself a popular favourite with the Growers for Market, the Gentleman's table, and generally the Exhibitor, throughout the Kingdom, that it is almost superfluous now to make a repetition of its merits in detail. Suffice it to say, during the time I have had the pleasure of introducing it, I have been favoured with orders for over 150,000 plants, which are distributed over all parts of the World and the hundreds of voluntary testimonials received in its favour fully confirm my previous description of its sterling properties, and entitle it to be classed the most popular and finest variety of Raspberry in cultivation, alike for its production, size, despatchment, colour, quality, and strong robust constitution.

I am offering Canes this season at the following reduced prices:

Planting Canes, 15s. per 100. 3s. per doz.
Fruiting Canes, 22s. 6d. per 100. 4s. per doz.

Price to the Trade on application.
EARLY ORDERS RESPECTFULLY SOLICITED.

BARR'S BEAUTIFUL HARDY DAFFODILS.

BARR & SON, 12, King St., Covent Garden, W.C.

BARR'S NEW OR RARE HARDY DAFFODILS For pots, culture, &c. Full description in the Gardeners' Chronicle, October 30; or send for B. & S.'s illustrated Daffodil Catalogue, free on application.

BARR'S INEXPENSIVE HARDY DAFFODILS In Beds, surpass in beauty and effect all other spring flowers, and for Masses in Flower Borders they have no equal.

When all at once I saw a crowd, A host of golden Daffodils; Beside the lake, beneath the trees, Fluttering and dancing in the breeze.

The culture of the Daffodil is simple, growing in all soils and all situations; no amount of frost or unfavourable weather will injure the bulb or flower.

For Naturalisation, plant in grass or by lakes, streams and ornamental water, in a fine rose what Wordsworth saw when he penned the following:— "I wander'd lonely as a cloud That floats on high o'er vales and hills, When all at once I saw a crowd, A host of golden Daffodils; Beside the lake, beneath the trees, Fluttering and dancing in the breeze."

The culture of the Daffodil is simple, growing in all soils and all situations; no amount of frost or unfavourable weather will injure the bulb or flower.

For Naturalisation, plant in grass or by lakes, streams and ornamental water, in a fine rose what Wordsworth saw when he penned the following:— "I wander'd lonely as a cloud That floats on high o'er vales and hills, When all at once I saw a crowd, A host of golden Daffodils; Beside the lake, beneath the trees, Fluttering and dancing in the breeze."

NOW READY.

THE GARDEN ANNUAL ALMANAC and ADDRESS BOOK for 1887.

This is the most complete and accurate Yearly Reference Book for the use of all interested in Gardens ever published. The Alphabetical Lists of all Branches of the Horticultural Trade have been corrected up to the end of October. The Lists of Gardens and Country Seats have been very carefully and extensively revised, and are admitted to be the most complete ever published. The "Garden Annual" may be ordered through all Booksellers, Nurserymen, and Seedsmen.

PRICE, ONE SHILLING; POST-FREE, ONE SHILLING AND THREEPENCE.

37, SOUTHAMPTON STREET, COVENT GARDEN, LONDON, W.C.

MESSRS. JAMES VEITCH & SONS

ARE NOW SENDING OUT THE

TWO UNDERMENTIONED NEW FRUITS:—

APPLE, "BISMARCK."

A very large and handsome oblate fruit, slightly undulating on the surface, and generally longer on one side of the axis than the other; skin yellow, flushed and striped with red on the exposed side. A fine Culinary Apple that keeps well and retains its flavour to the end of April.

First-class Certificate, Crystal Palace, September, 1885.

Price 5s. each.

STRAWBERRY, "WATERLOO."

The fruit is large, roundish, with a smooth, dark vermilion-red skin. It is of excellent flavour, solid, juicy, deep crimson-red, and travels well when packed. The plant is of upright habit, with a deep glossy green foliage which is not liable to Red-spider.

First-class Certificate at the Royal Horticultural Society's Gardens at Chiswick, in the summer of 1885.

Price 6s. per dozen.

**ROYAL EXOTIC NURSERY,
KING'S ROAD, CHELSEA, S.W.**

THE COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

The best varieties in cultivation, including many kinds of our own raising, of superior merit. Also, choice Hybrid Seedlings, in all sizes. For description and Price see CATALOGUE.

AZALEAS.

An immense stock of Azalea mollis Seedlings; fine bushy plants, covered with bloom-buds, 8s. to 9s. per dozen, 50s. to 60s. per 100. Also, Azalea pontica, well-budded plants, 4s. to 6s. per dozen.

GENERAL NURSERY STOCK in the finest condition for transplanting. CATALOGUE on application.

ISAAC DAVIES & SON,

NURSERYMEN, ORMSKIRK, LANCASHIRE.

PAUL & SON'S

Great "Hardy Plant" Nurseries,
THE OLD NURSERIES, CHESHUNT.

Station Great Eastern Railway, 13 miles from London.

THE NEW EDITION OF ROSE

and Fruit and Ornamental Tree Catalogues are carefully prepared and worth consulting by Planters.
Post-free on application.

PAUL & SON'S CHESHUNT ROSES

have maintained the 50 years' reputation of Paul's Firm.

PAUL & SON'S FRUIT TREES.

Unquestionably the finest standard Apples, Pears, and Plums in the Trade, 50,000 for Sale. Large planters should come direct to the producers.

PAUL & SON'S ORNAMENTAL TREES.
Particoloured, Avenue, or Shelter Trees in almost unrivalled variety.

PAUL & SON'S SHRUBS & EVERGREENS
Hollies—8 acres of the finest Gold and Silver kinds. All evergreens so frequently transplanted as to be safe to remove.

PAUL & SON'S AMERICAN PLANTS.
Rhododendrons, and Azaleas smothered with bud. Grown in loam at the High Ditch Nursery.

PAUL & SON'S HERBACEOUS & ALPINE PLANTS.
An immense variety at the new Brookbourne Nursery specially devoted to these plants.

PAUL & SON,
THE OLD NURSERIES, CHESHUNT,
were the continuous exhibitors at the Colindriens.

BE CAREFUL IN THE ADDRESS.

HELLEBORES,
OR
CHRISTMAS ROSES.

I am very pleased to be able to offer a magnificent lot of Christmas Roses, probably the finest lot in the trade. All the varieties now offered are strong Home-grown Clumps, full of Flower-buds, and I would advise Early Orders to secure them, as I know the stock of fine Clumps is very limited this season.

NIGER CAUCASICUS.

An intermediate form between *major* and *maximus*, having dark mottled stems and dark green erect foliage. The flowers are large and very conspicuous, pure white when flowered in a cold frame or even where protected by shrubs, but when fully exposed the outside of the petals are slightly tinted with rose. It is one of the most vigorous of the Christmas Roses, and one which will succeed where some of the ordinary varieties fail.

Fine Strong Clumps full of Flower-buds, 1s. 6d. and 2s. 6d. each, 18s. and 24s. per dozen.

MADAME FOURCADE.

This is a gem: variety of medium size, snow-white, and produced in the greatest profusion, the very smallest plants flowering; the foliage is light green, of a spreading habit, and a very robust grower, quite distinct.

Strong Flowering Clumps, 1s. 6d. and 2s. 6d. each, 18s. and 24s. per dozen.

MAJOR.

Although this plant is frequently offered, it is seldom to be obtained true to name, owing to its great value for cutting purposes. The flowers are pure white under glass, but have a slight rosy tinge in the open; it is the greatest favourite among market growers, producing flowers from December to January. It is a grand variety for potting, the foliage is so close and compact, and the flowers abundant.

Fine Strong Clumps, full of Flower-buds, 1s. 6d. and 2s. 6d. each, 15s. and 24s. per dozen.

MAXIMUS.

A robust variety, the largest of the group, and very ornamental as a foliage plant. The blossoms are large and white, shaded with rose on the exterior, and generally produced in twos, but if shaded or a glass placed over the plants the flowers are then pure white. By shading, the flowers can be retarded even to December. It is the most vigorous of the section, and succeeds where many of the others fail to grow.

Extra Strong Flowering Clumps, 2s. 6d., 3s. and 4s. 6d. each; 24s., 30s., and 48s. per dozen. Smaller but still flowering, 1s. and 1s. 6d. each, 10s. 6d. and 15s. per dozen.

RUBRA.

One of the most distinct and novel of this group, a variable red Christmas Rose. The flowers are large, produced about the end of January, and are of lovely rose colour. It is a robust grower, very free blooming, and a decided acquisition for cutting purposes.

Strong Flowering Clumps, 2s. 6d. each, 24s. per dozen.

NIGER.

COLLECTED PLANTS.

I have just received a very heavy consignment these, which are really fine healthy stuff, full of flower-buds—I think the finest batch of imported Hellebores which ever reached me.

THOMAS S. WAIE,
HALE FARM NURSERIES,
TOTTENHAM, LONDQ.

P.S. Trade Prices may be had upon application.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 20, 1886.

TOMATOS.

IN Messrs. Sutton's trial grounds at Reading eighty-five comparisons of Tomatos were made this year, the plantation being undoubtedly one of the finest in the country. Numerous so-called varieties, which are not really distinct, are included every year in various lists which are put before the public, but they are all tested here so as to ascertain their actual merits and distinctions. Sixty-five of these varieties were planted side by side this season, and I have lately had the satisfaction of comparing them together—good, better, and best, as the case may be. It is needless to mention the worst, or to explain that the firm named above will only include in their catalogues next season a limited number of distinct varieties, such as they have proved to be the best.

But the best varieties indoors and under the protection of glass are not the best everywhere; and this is a point to be carefully considered. President Garfield, for instance, is the most popular Tomato out-of-doors in Germany, while in this country, with its cooler and shorter summer, it proves too late for outdoor cultivation, though it is a capital sort—and the largest under glass. In comparing it with Sutton's Earliest of All on September 29 only a few of its earliest fruit were ready for picking, and most of the crop was not in a condition to ripen; while the other variety, which is probably the earliest Tomato in cultivation, had commenced ripening August 8, and carried, at the date just given, a most abundant crop in heavy bunches. Tomatos in this climate must be early, three most essential points in their cultivation being early maturity! early maturity! early maturity!

In regard to their shape, the principal types of Tomatos are—1, flattish-round; 2, globe-shaped; 3, oblong; and there is a Pear-shaped variety. In addition to the various hues of red, scarlet, and crimson which distinguish the ripe fruit, Messrs. Sutton have a yellow Tomato of peculiar appearance, which is not found, however, among the twenty-one distinct sorts in their catalogue, or in the *Annals of Horticulture*, 1886.

As there is very great variety in size, shape, and character among Tomatos, and very great differences in the quality of the fruit and its flavour—as much difference as in a Williams' Pear in perfection, and the same when "sleepy" and flavourless—I propose noticing some of the best sorts which we cut open, and in many cases tasted, during an interesting inspection—and partook of freely, too, with satisfaction, and without after-smart or any unwelcome pinch. I shall describe such characteristics as were obvious to sight and taste, relying necessarily upon my able informants on the spot for such hidden qualities and intrinsic merits as one cannot detect at a glance.

The Earliest of All is the earliest Tomato in cultivation, remarkably productive, perfectly smooth of surface when grown under glass, and not much corrugated even in the open air. It is, therefore, a most valuable variety for outdoor cultivation, growing and ripening perfectly in these trial grounds in an open border, without a wall, trained to sticks 3 feet 6 inches high, two plants to each stick, and each pair of plants one yard distant in every direction from the neighbouring pair. The fruit is solid, and juicy quite to the skin when ripe, differing therein from those inferior varieties in which the juicy pulp occupies only the middle of the fruit leaving a hollow cavity between that central part and the skin or rather the fleshy shell which the skin envelopes.

Chiswick Red bears large clusters of fruit of oblong shape and vermilion shade of red. It is very prolific, bearing several great clusters of fruit to each plant, and we found that some of the clusters were composed of as many as fifteen or twenty and even twenty-five ripe Tomatoes. Eat it, ye vegetarians, as salad or sauce and train it, ye gardeners and amateurs, under the rafters of your "housen," where it will supply you all through the winter with fresh, ripe fruit of medium size, needing less heat than the larger sorts, and proving almost as ornamental and more useful than Japanese Chrysanthemums. It was raised at the gardens of the Royal Horticultural Society in 1853, took a First-class Certificate, Royal Horticultural Society, and was introduced by Messrs. Sutton last year. How much society owes the seedsmen! Why, then, should brewers only be raised to the peerage at the rate they have been lately—Guinness, Allsopp, Bass? They deserved their honours, doubtless, but I think some gardeners and seedsmen should be promoted too.

Powell's Early is a second early, with large, flat-tub, round fruit, borne in large bunches. Fruit rather corrugated, and therefore not so suitable for exhibition as some varieties. Next to early maturity, the attainment of a smooth surface has been the greatest improvement accomplished for Tomatoes, not that mere smoothness would add much to their value, but for reasons easily appreciated in cutting open the fruit of corrugated sorts, as well as those that have been improved. There is correlation of growth between outside and in, and smoothness is accompanied by a skinful of juicy pulp, while corrugation implies waste, owing to the large extension of the surface-skin, and a liability—from Powell's Early is not free—to crack in the centre. It is a good sort, too, and very productive, but I think perhaps a baronetcy would sufficiently reward the raiser.

Vicks' Criterion is a very good sort, Plum-shaped, quite smooth, and distinct and novel in its colour, which is bluish-crimson, instead of the usual scarlet.

Reading Perfection is the handsomest variety in cultivation; fruit perfectly smooth, and flat-tub-shaped in shape; juicy to the outside skin; no waste, as the fruit is not at all corrugated. More suitable for indoor than for outdoor treatment, although with care a satisfactory return may be made by planting in the open. This is the finest type of exhibition Tomato.

Cluster, a very ornamental variety—not only excellent for decoration, but most useful to those who like a small Tomato for the table. The fruits are perfectly round and smooth, about the size of a marble, and are produced on long handsome racemes.

The next batch we inspected was an improvement on Cluster, with much larger fruit and even longer racemes. There is another Cluster variety with small fruit in shape like the old Jargonelle Pear.

Red Cherry is a very appropriate name for another variety, and Red Currant is another well named and most remarkable sort. The fruits are scarcely larger than a red Currant, and are produced on racemes 2 feet in length, often bearing as many as forty-five to fifty fruit.

Maincrop is a handsome sort, and, as its name implies, is a main crop variety. It is quite distinct from any other sort, the leaves being very much larger, and more like those of the Tobacco plant. It is wonderfully productive, and ripens well on an open border, and still better under a south wall. Flavour delicious. Jean Jacques Rousseau, sent to bed supperless as a little boy, said to the hot joint upon the table, "Good-bye, roast meat!" and I could almost have said in quitting the Tomato grounds, "Good-bye, Maincrop!" but then there is such a difference between feeling full, or famished.

H. E.

New Garden Plants.

PASSIFLORA WATSONIANA,* *Mast., sp. n.*

This is a species which, if devoid of the special attractiveness of some others, is nevertheless endowed with much grace and elegance. For our knowledge of it we are indebted to the Director of the Royal Gardens at Kew, and Mr. Watson, under whose charge the plant is, has been good enough to supply us with specimens for figuring. Its native country is not known, and there is, so far as we can ascertain, no specimen in the herbaria. We have, in consequence, named it in complement to the able and obliging superintendent of the indoor department at Kew. As a species it belongs to the *Granadilla* section, differing, however, from the great majority of that group by the presence of very minute fugacious bracts, instead of the usually leafy and more or less persistent organs. It is nearly allied to *P. Raddiana* (the *Kermesina* of gardens) and to *P. picturata*, but differs materially from both, not only in the bracts but also in the arrangement of the corona, and in other particulars.

This species has cylindrical wiry purplish stems, with (for the genus) rather closely set leaves. The leafy stipules measure about half an inch in length and rather less in width; in form they are reniform,

FIG. 126.—SECTION OF *PASSIFLORA WATSONIANA*, SHOWING ARRANGEMENT OF PARTS. (SEE TEXT.)

slightly toothed. The petioles are about 1 inch in length, cylindrical, provided about the middle with two mite stalked glands. The blade of the leaf measures about 3 by 2½ inches, is deep green above, violet beneath, broadly ovate in outline, cordate, subpetalate, diving to the middle into three oblong-acute lobes, with a few glands in the intermediate sinus. Pedicels axillary, 1-flowered, twice the length of the adjacent leaf-stalk. Bracts scattered, setaceous, fugacious. Flower-buds oblong, cylindrical, slender. Floor about 3 inches in diameter. Flower-tube about a quarter of an inch long, dilated at the base, umbilicate at the attachment of the stalk, deeply

* *Passiflora* (§ *Granadilla*) *Watsoniana*, *Mast.*, sp. n.—Glas, ramis cy induratis tenuibus rigidis; stipulis 1½–1½ mm, longifoliceis reniformibus denticulatis; petiolo graciliter 2 cm. long. glandulis stipulatis parvis 2–3 minutis; foliis 5–6 cm. 7–8 cm. lat.; superiore viridibus subpurpureo-crenatis subulatis palmatis 3-nerviis, trilobis, lobis oblongo obtusis sinus inter lobos lata glandulis sessilibus proclatis; pedunculis axillaribus solitariis, 1-floris petiolo duplo longioribus; bracteis diis setaceis caducis; flore diametro 7–8 cm., tubo brevi venoso basi intruso apice valde constricto; sepalis oblongis obis dorso sub apice leviter corniculatis; petalis conformibus sepius equilongis albidis seta pallide violaceis; corolla faucibus e his numerosissimis erecto-patentibus conflata, filis extimis peti sequantibus violaceis basi albidis-fasciatis, filis intus dimo brevioribus purpureis capitellatis, corona media membrata erecta tubulata supra medium circa gynophorum conca, margine in fila erecta numerosissima purpurea divisa; core intra mediana annulari; corona basiliati tubulata basi cymophoro conerescente superiore libera cupuliformi; stam. n. rubro-maculatis. ovario oblongo ovoido glaucescente stylophoro maculato superato; fructu ingoto. Fœtra milii ince versatilibus Brasilia meridionalis. Specimina viva in Palto horti regii Kewensi examinavi.

constricted above. Sepals linear, oblong, obtuse, with a small horn near the apex, green, with a whitish margin externally, white flushed with violet within. Petals as long as the sepals or nearly so, somewhat narrower, of a very delicate lilac tint. Corona of many rows of threads, the outermost nearly as long as the petals, violet with narrow transverse bars of white below the middle. To these succeed numerous slender capitellate threads half the length of the foregoing, and of a deep violet colour. The membranous corona or innermost of the faucial series consists of a purple membranous tube, narrowed towards the upper end and dividing into a number of erect purplish filaments pressed up against the column. The infra-median corona is a fleshy rim projecting from the inside of the flower-tube below the middle. The basilar corona is conerescent with the base of the column for about one-third of its length, above which it expands into a shallow fringed cup. Column purple-spotted, glabrous. Filaments and styles spotted. Ovary ovoid, oblong, glaucous, much shorter than the style. *M. T. M.*

VANDA DEAREI, n. sp.*

This new Vanda flowered in September last in Baron von Schröder's celebrated collection, at The Dell, near Staines, where it was grown by Mr. Ballantine. It was obtained from Colonel Deare, and is of Sondaic origin. Its *debut* at the Royal Horticultural Society, on September 7 and 8 last, was honoured by the award of a First-class Certificate.

My knowledge of the plant is based on a leaf and dried flower. My coloured sketches of the fresh flower were made at Kew. It is decidedly very similar to *Vanda tricolor*. The leaf is very sharp, bidentate, and measures 1½ inch in breadth. Some say the yellowish-green colour is characteristic of this species, but I do not believe it. The chief peculiarities of the flowers consist in the shortly stalked sepals and petals with large blunt laminae without undulations. The median sepal is unusually large. The lip is of a brighter yellow colour than those organs. I think there was a kind of tessellation of darker yellow blotches on a brighter ground. I did not put these details in my sketch, because my yellow paint was not bright enough. I noticed, however, that the lip was gamboge-yellow. That organ is as broad as that of *Vanda tricolor planiflavis*. I hope that the little callus over the anterior part of the conical spur may be distinctive, if it always appears as it did in my flower. It is rounded sulcate, very short, while the callus in *Vanda tricolor* is longer, broader, and very widely channelled. There are a few hairs beneath the callus. At all events it is a very interesting plant. I hope to obtain eventually richer inflorescences, and become better acquainted with it. *H. G. Rehb. f.*

ODONTOGLOSSUM CONSTRICTUM (Lindl.) PALLENS, n. var.

Mr. F. Sander kindly sends me this. It has light sulphur-coloured sepals and petals, and a whitish column and lip, the last with a lightest yellowish hue. It may be an extraordinary rarity, but both the genuine Lindleyan type, as the *C. castaneum*, also sent by Mr. F. Sander, in November last, are far superior. *H. G. Rehb. f.*

MASDEVALLIA GLAPHYRANTHA x, n. hybr. Veitch.

This is a new and elegant member of the smaller types of the *occinea* group. It has a flower as large as those of *Masdevallia Barlaeana*, but the tube is rather short and wide, pale outside, and bordered by the reflexed overlapping margins of the free lacinia, which are of an exceedingly warm and clean purple. Their free bodies are triangular, widely surpassed by the yellow tails, which are neatly reflexed as one sees sometimes in *Masdevallia infraeta*. Petal, lip, column, are of nearly the same length, included in the tube. Petals ligulate, emarginate, retuse at the top, with a spreading angle at the base looking to the lip. Lip ligulate, with reflexed anterior top, purple at the base, with two purple stripes in front. There is an obscure tumour at the top. Will this tumour prove constant? I scarcely believe it.

This *Masdevallia* is declared as of doubtful origin by the kind sender, Mr. Harry Veitch. Mr. Seden has no record of its descent. Mr. Harry Veitch thinks of a descent from *Masdevallia Shuttleworthii* in. Seden remembers experiments with *Masdevallia* in-

* *Vanda Dearei*, n. sp.—Aff. *Vandae tricoloris*: sepalis tepalibus breviter unguiculatis, lamina ellipticis brevis obtusis; petalis marginibus maculatis, lobis quadratis parvis, lacinia antica transverse pandurata lata, calcaris conico subacuto, callo brevi rotundato sulcato supra ostium in labelli base. Flores flavo-stenosis rufis in lacinis lateralibus quasi asteris in basi laciniae anticae. Ins. Sondaic. In coll. ex. Baronis de Schröder, floruit September, 1886. *H. G. Rehb. f.*

fracta. At first sight I thought of this both on account of the short tube and of the rolled tails. *Masdevallia Barleana* may be the other parent.

Doubtful as this little gem is in its origin, it is doubtless a lovely thing, that must procure good friends among all Orchidists who see it. It has a great shortcoming—there is but one plant of it. *H. G. Rehb. f.*

ORCHIDS IN FLOWER AT MR. B. S. WILLIAMS'.

IN spite of those who proclaim the scarcity of Orchids that flower at this season, a visit paid to this

numbers of *C. Trianae* that make up the bulk of the plants in the house give plenty of promise of a full harvest of flower later. In the next house visited were *Cattleya Dowiana aurea*, its colours still bright and rich, notwithstanding the blotted-out sun and indifferent light; *Oncidium obryzatum*, a distinct small-flowered yellow variety with a much branched spike; *Cattleya maxima*, the rich brown and yellow marked *Odontoglossum Inseayii* and *O. Rossii* were all found more or less in flower; and *Sophranites grandiflora* formed a grateful patch of fiery red amongst the tamer tints.

Miltonia candida in several examples was in bloom,

named *C. S. magnificum*, a very handsome flower; *C. Lindleyanum*, slight, yellow, and tall, but nearly always in bloom; *C. Harrisonianum*, also showing varying depths of colour and degrees of waxiness; *C. insigne Mooreanum*, a light-tinted, bold flower, semi-transparent, and long-stalked; *C. Sedeni*, an enormous plant of which was bearing a great number of blooms; *C. S. superbum*, *C. S. cardinale*, *C. ciliolare*, *C. Roezlii*, distinct and tall; *C. chloroneurum*, an improved *venustum*; *C. Haynaldianum*, *C. longifolium*, and *C. biflorum*, a *Warneri* in growth and flower, but with the habit of bringing twin blooms. In the *Cypripedium* division other plants were found

FIG. 127.—PASSIFLORA WATSONIANA: COLOUR PALE LILAC, LEAVES PURPLE BENEATH. (SEE P. 64S.)

nursery always reveals many still in flower to delight the *connoisseur*. In the first house entered was a suspended plant of *Ceologyne Massangeana*, going off somewhat but still with its four long racemes pretty thickly studded with bloom. Near by *Oncidium tigrinum* was seen in several examples with sprays of its long-enduring blooms; *O. Jonesianum*, small, but rarely out of bloom; the lovely orange and yellow colours of *O. Marshallianum* brightened up the little group by the door. A few *Lycaste Skinneri* in various colours, and some *Cypripediums*, as *Maulei*, *Chantini*, *Acrides Rohanianum*, a form of *A. suavisimum*, with pale yellow enduring flowers, and a specimen of *Cattleya Trianae* were also in flower in this house. The great

as were *Laelia Dormaniana*, with the rich purple lip and half closed sepals; *Laelia elegans brassiata*, sepals and petals of green, suffused with purple faintly, lip of purple; several forms, all showing minor differences of colour of *Laelia Perrini*, *Oncidium varicosum*, the rare *Lycaste Skinneri alba* with one bloom expanded, and lastly, a *Cattleya gigas* of two spikes—a fairly good form of the variety. In this house was a flower-stalk of *Peristeria elata* furnished with the unusual number of three lateral branches.

The *Cypripedium*-house proper contained a number of species and varieties that were bearing flowers, viz., *C. Spicerianum*, in various forms, the best being one

in flower, as *Vanda tricolor insignis*, which is a very constant species; *Phalenopsis amabilis*, *P. rosea*, a constant bloomer also; and *Vanda cerulea*.

The small *Odontoglossum*-house contained some plants of *O. Alexandre*, *O. Andersonianum*, *Oncidium Forbesi*, so rich in colour; *O. bracteatum*, a long flower-spike, densely set with quite minute flowers, yellow as to the lip, and spotted with brown on sepals and petals. A good piece of *Mesospinidium vulcanicum* had two flower racemes, massive for this species; another plant in flower was *Oncidium incurvum*, with flower of violet-rose.

Dendrobium superbiens in numbers were in flower, also *D. bigibbum album*, which is not album at all,

but bluish coloured; *D. Dearei*, just coming into flower; *Cattleya Walkeri* (dolosa), *A. Masdevallia* troglodytes, with bell-shaped flowers, and tails that stretch out horizontally, the inner colour of the flower being red-brown, and the outer pale brown. This is a most peculiar flower, and is, owing to the position in which the bloom is held, seen best from below. A small plant of *Angræcum Leonis* was carrying one of its handsome white flowers, and *Warsceviczia* discolor, several of the latter plant being in a suspended pan. *Trichocentrum albo purpureum*, differing from the type in the richer colour of the lip; and *Phalænopsis antennifera*, of a light rose colour, were in flower in small specimens; the latter is a very constant flowerer.

Of other than Orchids we noticed *Hemanthus Catherineæ* superbus, bearing a glowing scarlet corymb of bloom, a fine plant at this season; *Amaryllis* Mrs. W. Lee, *A. Comte de Germiny*, and *A. Mrs. Garfield*, useful late-season varieties. The pretty *Sonerilas* are well done here, and are not coddled in any way, therefore the more useful.

BOTANICAL RAMBLES IN SOUTH CHINA.

(Continued from p. 647.)

On the same island I found a fine arborescent *Rhododendron*, with dark green coriaceous leaves and large heads of beautiful blue-pink flowers. Dr. Hance, a short time before his death, noted its affinities and found it to be near *Rhododendron arborescens*. He intended to publish it in the *Journal of Botany* under the name of *R. photiniflorum*, but I do not know whether his description had been sent to England before his death, if not it will no doubt be found amongst his manuscript notes. The tree grows at a height of 3000 feet, and might stand a temperate climate, as in its native soil it is exposed to very variable climatic conditions. In the spring it is enveloped in a dense mist, which keeps the vegetation saturated for weeks. As the summer advances it is occasionally exposed to the fury of the Chinese typhoon, and in the winter to the dry cutting winds and prolonged drought that dries up the watercourses and bakes the soil quite hard.

Growing near this *Rhododendron* I found a curious *Arisema*, pronounced by Dr. Hance to be new, and near *A. Tartaricolum*, from Peking. The yellowish-white spathe curves over the short club-shaped spadix and tapers off into a thin caudate filament about 12 inches long. I was greatly interested a short time after finding this *Arisema* in finding another Aroid on Tai Mo Shan, with the same remarkable development of "tail," but the "tail" in this case, instead of being a prolongation of the spathe, was a prolongation of the spadix. In both plants this curious appendage bends down and touches the ground, and may, as Hooker says, serve as a kind of staircase for insects to crawl up and assist in fertilisation. If this be so, the coincident variation of two distinct organs is very remarkable and interesting. Another handsome Aroid, probably an *Amorphophallus*, was also found growing on Tai Mo Shan in rocky niches. The foliage of this one exactly resembles that of *A. variabilis*, but the spathe is greenish and heavily blotched with purple and is considerably shorter than the spadix, which is long, smooth, and of a chocolate colour, while in *A. variabilis* the spadix is white, roughly pilulose, and shorter than the spathe. Dried specimens will have reached Kew by this time, where the specific characters will be examined.

One sweltering hot day late in the spring I went up a steep ravine and reached an elevated plateau where three streams met; and the tops of the surrounding crags closed inward in one corner and formed a cool shaded retreat. Looking round I noticed a tunnel-like gully formed by the bed of a small stream. The rocks on both sides were covered with the scabrous rosulate *Drosera Loreuxii* and the slender *Utricularia bifida*, *Begonia laciniata*, *Arisia pumilifolia*, and the beautiful blue-berried *Ophiohypogon spicatus*. The passage was filled with *Salix flexos*, the gay-flowered but prickly *Cesalpinia naga*, and other spiny plants. Here, in an open space exposed to the sun, I found the gem of my collection—an *Aristolochia*, now described by Mr. Hemsley in the *Journal of Botany* for September, 1885, as *A. Westlandii*. It was straggling over the face of a large boulder, and was covered with broad fleshy flowers as large as a man's hand. The

shape and colour is difficult to describe. It resembles *A. longifolia*, recently figured in the *Botanical Magazine*, but is much larger. The leaves are lanceolate, and vary from 6 to 10 inches long and 1½ inch broad. The flower, and, in fact, the whole plant, is decidedly handsome. The original plant, which I took up, and which is now at Kew, had thick jointed tubers about 9 inches long.

Higher up the hill, in an adjacent ravine, I was delighted to find another new species of this genus, also described by Mr. Hemsley in the *Journal of Botany* for September, 1885. This has a very modest flower compared with the other one, and belongs to an entirely different section of the genus. It sends out long shoots that crawl negligently over the rocks, or climb up the shrubs in its vicinity. The flowers are reddish-brown, trumpet-shaped, with a globose swelling at the base, and about an inch long. The leaves are cordate acuminate, bright glossy green, with a network of raised veins on the underside, which make the plant rather striking as a creeper, and although it may not be of much horticultural value, it is very interesting botanically; it has been named *A. Fordii*. In the same ravine I discovered another new *Rhododendron*, but, as Dr. Hance remarked when he saw the flowers, "It is not likely to be awarded a gold medal at a flower show." The flowers are scarlet, and exceedingly small—50 minute, in fact, that it is difficult to see them on the plant without very close inspection. This plant has the habit of *R. indicum*, but the leaves are much narrower, and, on the young shoots, much longer.

Near the top of this mountain the fragrant *Daphne odorata*, the rare *Vikstrœmia monula*, and fine stony plants of *Rhododendron indicum* and *R. Fareuse* can be found in quantity. Some of the rocks at this elevation (3000 feet) are covered with patches of *Peperomia reflexa*, and another species of *Peperomia* which has not yet been submitted to an authority for determination. The first mentioned species has a very wide distribution, but has not, I am told, been found in China before. Here we likewise find *Torenia Fordii*, *Chirita sinensis*, *Strobilanthes Champolivi*, *Danella ensifolia*, *Arisia chinensis*, *Melastoma repens*, several species of *Rubus*, and thick beds of *Eichynanthus bracteatus*. *Dichroa febrifuga* and *Ilex viridis* and *I. menziesii* are also common at this elevation.

Sheltered nooks that had once been cultivated and afterwards abandoned, are covered with wild *Banana* and *Colocasia indica*. Farther down the long flat valleys are studded with villages and Rice fields. In the distance the numerous islands of the China Sea appear like outposts guarding the shores of a great continent, and the harbour of Hong Kong with the city behind it form a fine panorama. Looking west a far-off island dotted with white specks, rises dimly in the distance; this is the island and holy city of Macao, one of the first advance posts of commerce and christianity in this distant region, and the place where the unfortunate Luis de Camoens wrote his great poem the *Lusiad*, some time previous to the year 1569. The commercial prosperity of Macao is almost a thing of the past, and it seems hard to reconcile the exemplary morality of this "holy city" with the fact that the bulk of its revenue is derived from the Chinese gambling halls. Farther round to the north, the ocean is stained with a thick yellow current issuing from the mouths of the rivers that converge near the famous city of Canton. The water is alive with ships, that give a peculiar foreign character to the scene.

The bare exposed appearance of the landscape would lead one to expect a hard drought-loving type of vegetation capable of withstanding the extremes of drought, heat, and cold to which it is exposed, but at present the bulk of the plants may be said to be strictly moisture lovers. Bentham, when he wrote the *Flora Hongkongensis*, was struck with the tropical character of the great majority of species. He specially mentions the affinity of the flora with the tropical Asiatic flora and plants from the hot wet hill regions of Khasia and Assam, and notes the absence of plants pertaining to the dry parched regions of Western India. That the now bare hills of southern China were once more thickly clothed than they are at present is tolerably certain. The geographical affinities of our flora above-mentioned would seem to substantiate the supposition that it is but the lingering fragment of a great flora that had been devastated in the first instance by the swarming inhabitants of the coast and the inland valleys, and afterwards weakened by the adverse

climatic conditions. There is, it is true, a fair proportion of plants peculiar to this region, but I do not think that there is any evidence to show that the present nature of the climate and other physical features of the locality account for their limited distribution. The fact (which Bentham remarked) of "the comparative number of monotypic genera being far greater in the Hong Kong flora than in that of any other flora of similar extent," supports the conjecture that a number of the species of these monotypic genera have died out or have been destroyed.

No one who is unfamiliar with the peasant life of this part of China can realise how rapidly the ancient endemic flora is disappearing. Nearly every accessible tree and shrub that may be dried and burnt is cut down with avidity; even the modest herbage of the hill sides is shaven off and dried for the same purpose; and when the intense drought of the winter has dried everything up, the villagers periodically set fire to the grass, so that the charred remains may fertilise the succeeding crop. It is a fine spectacle on a dark night, to see the distant hills lit up with long lurid bands of flames illuminating the gloomy heights and tinging the skies with the glow of the far-stretching conflagration. But the fire, unfortunately, is not confined to the grass slopes; it extends to the wooded ravines and withers up the vegetation of the steep crags that would be inaccessible to the ordinary wood-cutter.

How long these and other agencies have been working wholesale destruction would be difficult to estimate, and when we still meet with such a varied flora despite the many adverse conditions, we cannot help being impressed with the wonderful tenacity of plant life.

What would it have been under more favourable conditions, when even now on a barren-looking island, 8 miles long and 4 miles broad, we find upwards of 1100 species? It is painful to think of the number of plants that must have been swept into oblivion unrecorded by science, and, what is more important, their economic properties undeveloped and lost to the modern world; and yet China with her industrial resources, her ancient learning and her thousands of years of so-called civilization remains indifferent to the fact that the work of destruction is still going on, and it is not likely that she will awake to a realisation of the fact till a vitiated climate refuses to supply the wants of a surplus population.

In these desultory rambles I have collected eight plants new to science, and seven plants new to the flora of China, and this within a comparatively small radius. These results give but a faint idea of the richness of the field for botanical research. When we consider that the hills of continental South China and the country connecting these hills with the Cochinchinese coasts, with Barmah, Sihat, and Assam is still botanically unexplored, we can anticipate the amount of novelty they contain.

But very little can be accomplished in an occasional journey in the cool season up the rivers or across a small tract of country, and this is all that has been done as yet—not for want of will to do more, but because ways and means have not admitted of more extended research. Much good work has nevertheless been done in this way; but in order to get a satisfactory idea of what this broad continent contains it would be necessary to remain in the country collecting and noting everything of interest in a thorough manner. An energetic collector who could journey in the interior for a few years would, I am convinced, do more towards establishing a knowledge of what this mysterious country contains than the present desultory journeys are likely to do for the next fifty years. The financial outlay would not be very great, and the advantage of making an early examination of this fast fading flora cannot be over estimated or too forcibly urged. *A. E. Westland, Botanic Gardens, Hong Kong.*

DIOSPYROS KAKI.—Canon Ellacombe has long been known as a magician—we do not for a moment insinuate that he practises the black art, but he certainly does succeed in getting things to flower and fruit in the warm corners of his Gloucestershire garden that other people cannot do. A day or two since we received from him fruits of *Diospyros* more than half ripe, taken from a south wall. No doubt, if kept in a warm place, they will "blot" into something toothsome. From past experience we advise none of our friends to taste these fruits before they are well blotted.

MESSRS. JACOB WRENCH & SONS' TRIAL-GROUNDS.

ONE hundred and thirty-six years since—that is, in 1750—the business so long and so honourably known in the seed trade as that of Messrs. Wrench & Sons, was originated in Lower Thames Street, City. In the counting-house of the present premises in King William Street there hangs a picture of Old London Bridge, with all its quaint houses and shops, and certainly this memento of days long past was in fit accord with the early Thames Street shop or store in which the business of the firm was then carried on. But the destruction of the old bridge, and the erection of the noble, broad structure which now spans the Thames, doubtless impelled the enterprising members of the house, some fifty years since, to establish themselves in the street formed by the new bridge, at that time the most important thoroughfare in London.

Here in the present unassuming, but admirably placed business premises, an excellent illustration is afforded of the way in which space is utilised in the City of London, for whilst there are beneath the front of King William Street level two large floors, and again large dry cellars beneath those, there are above this level four other large floors all devoted to storage and business purposes. In addition to the above-mentioned, the firm holds waterside premises at Duxhead for the unloading and warehousing of seeds which are sent up by barge, hoj, or steamer. During all these years of trade life and activity the nature of the area of that trade has changed more or less according to changed conditions in gardening or agriculture, but it has not decreased—indeed, and in spite of the competition in the seed trade which exists, the old house has always maintained its position, doing its best to adapt itself to the spirit and requirements of the age. Finding the place crowded with Dutch bulbs we inquire whether the sales are as good now as before the institution of bulb auctions, and learn that the trade has increased tenfold within the last twenty years. In some instances sales may have affected some customers, but it would seem as if they rather had created new ones. In any case the half trade in King William Street has annually increased. The chief trade of the house is in agricultural seeds for producing root crops, the great cattle food agents of the day, and in vegetable seeds for market gardeners, among whom Jacob Wrench & Sons have always held a very high reputation. The association of market gardening with farming, which is found so widely prevalent now, especially in Kent and other of the home counties, has very naturally increased this market seed trade, and even beyond the responsibilities which attach to the private garden trade is it of the first importance that a house dependent so largely upon the confidence of farmers and market growers should supply stocks that are absolutely reliable. When we hear of growers putting down very large breadths of land under such crops as Cabbage, Cauliflower, Brussels Sprouts, Peas, &c., it is evident that any mistake in the stock supplied, or neglect in fully proving it, or in maintaining its high quality and correctness, would be productive of an irreparable loss to the grower. The same would happen to the farmer whose Swedes, Mangels, Carrots, or other root stocks were bad. No house can exist in the seed trade if it be negligent on this head. Hence it is of the first importance that every stock should undergo the severest ordeal of trial under the eyes of the responsible heads of the house, and to that end a suitable trial ground is essential. This interesting spot—because full of elements of interest to the gardener—we found adjoining the North Kent Railway, some mile or more beyond Lee station, and to be of several acres in extent. The soil is naturally deep and good, very friable at one end, and strong and adhesive at the other; thus admirably enabling stocks to bear the tests of such diverse soils. It is worthy of remark that the firm tests its own stocks and not those of other houses, hence we were saved from these depreciatory remarks which too often disfigure visits of this kind when trials include stocks not solely from a firm's own growers. Of course in such businesses as the one under notice, seeds are grown not merely in many places in this country but in others; hence it is needful that trials of all stocks grown for the firm should have the fullest testing.

Dealing first and briefly with farm roots, we found some sixty rows of Mangels on trial, several rows

being devoted to one kind, and each one representing stocks from different growers. So handsome and massive are the samples, on the whole, that we could almost wish Mangels were good garden roots. What can be more attractive than the rich orange-red golden Tankard, so handsome, clean, and even; or the Champion Yellow Globe, so stout, true, and free from toes or side roots? Bulbs such as those grown here in soil of moderate quality exhibit the true average character of the stock, whilst being grown closer than is the case with big roots on highly manured soils, the produce per acre is enormous. The Yellow Intermediate is also a capital kind—handsome oval shape, and perfect in form throughout; the Mammoth Long Red, a form perhaps less widely grown for stock feeding than are the yellow kinds, yet here it is so clean and handsome that the roots might be taken for huge Dell's Beetroot, so good are they. By way of contrast to these limited selections from so many, we are favoured with a review of some German kinds, one of which shows a globe form, but when pulled the bulbs are found to be hollowed out at the base almost like the bottom of a champagne bottle, thus proving very deceptive as a standing crop. It is evident that England has not a rival yet in the production of fine clean stock-feeding roots. Swedes, again, are very largely grown, and come up not less handsome. Wrench's Standard is a handsome short-necked stock, and has a very deep purple top. We are not expert in the variations of Swedes, but we can aver that the samples presented in this trial ground seemed to be of the very best. Kohl Rabi and white Belgian Carrots are also valuable stock-feeding roots, and the samples of these again are good, and will bear comparison with any others. With regard to garden or market Carrots, Albrocham and Long Sarey are the longest forms, both being very clean and true. In the sandier portion of the ground these roots, though only of fair size, come out very clear indeed, and bright coloured. Next come the scarlet Intermediate, differing in a very inappreciable degree from the new Intermediate; and James' Intermediate comes next for length, whilst the two former are the more massive varieties. Naturally the prejudices of the market must be studied, but it would seem as if no Carrots could excel these Intermediates for bulk or shape. French Forcing, Nantes Early, and Dutch Horn—the latter, a dwarf little kind—furnish the earliest and shortest samples. Beets, too, are numerous, Dell's being represented by many rows as, perhaps, the most popular Beet of the day. It is remarkable to see how many so-called Beets on a trial resolve themselves into Dell's Carrot; all the samples are good and true. The most noticeable, on account of the smallness of its top, is Frisby's Beet. The Covent Garden shows an excellent form, with rather dwarf even tops, colour reddish metallic, and roots good. The Pine-apple is stronger with spreading tops, and Dewar's Short-top seems to be identical with Nutting's Beet. Whyte's Black is an old and very robust kind, the roots large and having flesh almost black. It is noticeable that some have greenish leaves, yet the roots of these commonly produce the darkest flesh.

Parsnips also merit notice, as the roots, though long, come out so clean and good. The firm's chief stock is what is known as Elcombe's improved form of the Hollow Crown, and it is certain that the stock is a first-rate one. The roots show a rounded and somewhat elevated shoulder, with a hollow crown, and this distinction is most marked. The Jersey Parsnip is not so good as is the first named.

Onions of many kinds had previously been harvested, having ripened early, but of Lecks there was a good trial, the Musselburgh and the Lyon being the best, of these two the former seemed to be the hardiest and strongest, and could barely be excelled for all ordinary uses. This kind is the most acceptable for the market grower.

Of ridge Cucumbers the best stocks are Stockwood Ridge and Esford-hire Champion, although none seem to excel the former when carefully selected.

A big lot of dwarf Beans included Pale Dun, Canadian Wonder, Falmer's Early, Osborne's Forcing, Monster Long-podded Negro, with many others, all capital samples, and very true.

Of Runner Beans the firm's Gigantic Runner—a good scarlet stock, well selected and very prolific—was the best, the pods long, straight, and of a rich green hue, much like the new Ne Plus Ultra.

Farsley afforded a capital trial, and specially good, because so finely curled and deep in colour, is the Champion Curled. No wonder that such a good

thing is in great demand by market growers, as it is excellent in quality.

Members of the Brassica family now comprise the chief elements of our notes, and of these the trial of Cabbages, Kales, Broccolis, &c., is a very extensive and useful one. Most Cabbages are proved twice over, viz., from autumn and from spring sowings, so that the completest testing is given. Red picking Cabbages show the huge Red Drumhead, Red Dutch, and Early Dwarf Red, all capital stocks; but for hardiness and colour none can exceed the Red Dutch, the hearts being very firm, and in colour deep metallic crimson. Of white Cabbages, specially good is the firm's pretty Little Pixie, here so distinct, small, and solid; it is a perfect small garden or early Cabbage. Pigmy is another small hearting kind, very even and pretty. The colonial old Early York is in capital form; so is the East Ham, a favourite market kind, producing large solid heads with little outside leafage. Atkins' Matchless, London Defiance, and Wheeler's Cocoa-nut, are all capital forms, and true throughout. Leddy's Market, Enfield Market, and the Rainham, are all noted fine market kinds, having excellent reputations, and here are first-class. Gilbert's Chou de Burghley, with its tall sugar-loaf hearts, is again in perfect form, and is most highly praised for its quality when cooked. It ought to become a first-rate winter market Cabbage. Nonpareil Dwarf is a perfect dwarf green Cabbage, of great value for small gardens. Wheeler's Imperial and Shilling's Queen both present very fine Cabbages. The French Etampes resembles the Early Nonpareil. The Drumhead forms of Cabbage are very fine, one of the best being Flat Dutch, or Gibson's Drumhead, whilst the Glen Dwarf, a Scotch selection, is also a capital early kind. The stocks of Rosette and Hardy Green Coleworts are good, as also the various Savoy Cabbages, the Dwarf Um and Little Pixie, the latter rather unfavourably named by another firm, are charming selections, true and good. Green Curled and Dwarf Drumhead are also really first-rate, so even and true throughout. Brussels Sprouts are in good form, the bulk sprouting well on strong stems. The first is shown in a fine robust stock of Wrench's King of the Market, a fine selection of the firm, producing large solid Pear-shaped Sprout of delicious quality. The old London Market kind seems beside the former quite useless. Aigharth is fair in form, but the Wroxton, though not robust, is very even, producing an abundance of small Sprouts. Kales are plentiful, the Dalmeoy, Cotter's, and Bada, being fine free growers; whilst a beautiful green curd is the Selected Tall Curled, the heads very compact and massive. A pretty kind for winter garden decoration is the Dwarf Purple, of a deep metallic hue. Variegated Kales are also beautifully coloured and true.

A very large area is devoted to Broccolis of many kinds, but of course not at present in condition for remarks. Eclipse and Autumn Giant Cauliflowers were excellent—indeed, remarkably fine, the first-named being somewhat quicker in turning in from spring sowings, and thus helping to create a longer season. Not only are the stocks here first-rate, and producing wonderful heads, but they are exceptionally true—a matter of the first importance to growers. Early Cauliflowers had been largely tried, the Snowball proving the earliest and best.

The Rosery.

AUTUMNAL ROSE SHOWS, &c.

"WILD ROSE" writes so charmingly on Roses generally that it is unfortunate that any divergence of view should disturb his equanimity. Still rosarians may surely agree to differ, thus drinking in charity as well as fragrance from their favourite flowers. As to autumnal Rose shows being a "miserable failure" (that is rather an appeal to the imagination, and would hardly be indorsed by Mr. Findlay in the case referred to. It is also doubtful if August 28 was the best time for an autumnal show. Certain it is that the Roses at the Edinburgh International Show in September were not failures, and that I have seen not a few twenty-four in September equal or superior to those shown in June. But the best season for autumnal shows, like a good many other things, has to be determined by experience. And the fact that one autumnal show of the

National Rose Society did not come up to "Wild Rose's" expectations affords no valid reason for dismissing all future attempts as "kite flying." Even the latter occupation would have the merit of convincing "Wild Rose" and all whom it concerns that the current of public opinion had set in strongly in favour of ever-blooming Roses. Such being the case, the National Rose Society will fail in its duty to its constituents and to its sovereign if it fails to do its utmost through the holding of autumnal Rose shows, or otherwise to meet and satisfy the craving for good Roses all the year round. What if its first great experiment did not come up to its high pitched expectation nor pay? Has "Wild Rose" forgotten the nursery rhyme—"If at first you don't succeed, try, try, try again"? That would be far more sensible advice than to wait for any patent method of producing twenty-four good blooms in the autumn, as advised by "Wild Rose," p. 587. Surely this writer's experience of the scarcity of good autumnal blooms must be unique, if he considers any patent needed for their production. Good Roses have been common as Blackberries this season, right up to the last fortnight in October; and if such choice cuttings in plenty are possible now, they will become more numerous as well as more perfect as Teas are greatly multiplied and further improved, and the numbers of other perpetual blooming Roses are increased.

I certainly understood "Wild Rose" to mean that Tea Roses were rendered hardier by being worked on the seedling Brier, and am much obliged for his courteous explanation on this point. I wish, however, it had not been needful, as I fear we must not look to the seedling Brier stock as affording us any protection from frost. As to Lady Mary Fitzwilliam, I still claim it as a Tea, though, of course, I am well aware where it stands in the catalogues. But in bloom and foliage, it is almost wholly Tea. Did any doubt remain, its tenderness as against frost would set it among Teas. But these are matters of opinion, and of course those who merely follow the catalogues, or can trace any verisimilitude between Baroness Rothschild and Lady Mary Fitzwilliam, will assert that the latter is not a Tea. Well, well, it is, I am sorry to add, tender even on the Brier stock, and that was my only point *apropos* to the subject in hand.

I heartily endorse "Wild Rose's" remarks on the effects of soil and climate on Roses and other plants. These not seldom drag them down or raise them up quite out of their normal character. Probably sufficient allowance is not made for these disturbing forces in assessing the quantities of Roses grown at different seasons as well as in widely separated districts. Still I fancy I have seen Aberdeen and Darlington Roses—to take two Northern examples—almost if not a match for Cheshunt and Colchester flowers; and it cannot be truly said of Roses as of some fruits, the further North the worse in colour and quality. I am not careful to defend myself from the charge of ignorance of the National Rose Society and other matters. Full justice will be found done to it and its doings in my previous letters—see especially p. 526. But still much more remains to be done. Prize essays, for instance, might be offered for certain modes of curing such maladies as red rust and mildew. No doubt the free and full discussion of such matters in the *Year Book* is useful. I am also perfectly conversant with the methods of judging Roses, and for this reason was rather surprised at the revelation of judging by phalanxes. Possibly "Wild Rose" is about right concerning the profits of Rose showing, but then I am hardly responsible for its introduction, but those who condemned the holding of autumnal shows because they did not pay. If they are useful in stimulating new or strengthening old methods of fostering and developing continuity of blooming among Roses they ought to be held by our National Rose Society whether they pay or not.

But all this will be condemned as unpractical kite flying. Well, so is everything—such, for example, as locomotive steam-engines, railways, telegrams, telephones, new and fresh arrangements of Rose boxes, say in threes, sixes, or dozens of a sort in the higher numbers—until they are tried. But neither of these innovations, or others that might be named, could prove more unpractical than the sweeping statement of "Wild Rose," that the very best Roses for garden decoration are those contained in our exhibition lists. If this be so, why and wherefore has the National Rose Society made a separate list of garden Roses, and also offered prizes for them? But that it is not so I will prove by putting two witnesses forward as

fairly representative, and in such a case two are as good as two hundred—A. K. Williams and Gloire de Dijon. D. T. F.

GARDEN PALMS

(Continued from p. 491)

METROXYLON, Rottb.—There are about half-a-dozen species in this genus, which is confined to the Malaya regions, and which is famed as the source of sago, being largely cultivated on that account in certain parts of the East Indies. The word sago, according to Seemann, signifies bread in the language of the Papuans, among whom it is a staple food just

foliage. *M. vitiense* attains a height of over 40 feet in about fifteen years, whilst *M. laeve* is said to grow to a height of 20 feet in from seven to eight years. When full grown the inflorescence is developed from the summit of the stem, and is an erect panicle, 12 feet high, pyramidal in form, with the lower branches as much as 8 feet in length. The flowering and fruiting terminates the life of the plant, or rather of the stem that bears it, for in the *Metroxylons* we have the same habit of developing young plants from the base of the stem as is seen in the genus *Calamus* and *Plectocomia*, to which the *Metroxylons* are allied. In *M. laeve* the leaves are unarmed, but in the others they have clusters of long flat blackish spines on the petiole,

FIG. 125.—NANNORRHOPIS RITCHEIANA, SUPPOSED HARDY PALM. (SEE P. 653.)

as corn is with us. The sago is obtained by splitting the trunks of full grown trees of *Metroxylon*, and extracting the soft pulpy interior, which is then thrown into water. The starch which comes away with the water when it is drawn off, is then allowed to settle and afterwards washed several times to purify it and form sago. A tree fifteen years old is said to yield from 600 to 800 lb. of sago. Pearl sago is made by soaking the flour and allowing it to cake; it is then broken into pieces, sifted and rolled about in bags before it become quite dry, and again baked till it assumes the granulated appearance it has in our shops. Sago is also obtained from several species of *Cycas* and other Palms.

The appearance of the *Metroxylons* is somewhat peculiar. They have large and sometimes tall trunks, surmounted by a crown of pinnate

especially on the lower sheathing portion. In *M. vitiense* the spines are arranged in long sinuous lines, running more or less transversely around the petioles, giving them a singular appearance. The pinnules are dark green, 3-4 feet long by about 3 inches broad, and they are arranged in two straight rows along the rachis. The seeds are globose, slightly pointed at each end, 3 inches in diameter, the husk composed of numerous diamond-shaped scales, lightly overlapping, light shining green in colour, and forming a hard bony covering to the globose kernel, which is smooth, and formed of hard white albumen. *M. americanum* has the largest seeds. The species flourish only in hot swampy places, and under cultivation in stoves with us, they must have abundance of heat and moisture, and be planted in a rich soil. I have never seen

plants raised from seed sown at Kew, and according to Bennett they are seldom propagated from seed in their native homes, the seed being generally unproductive: but as the offsets are freely produced by large plants, and as the process of fruit-bearing uses up all the starch in the stem, it is probable that the natives seldom allow healthy trees to reach the fruiting stage. The plants at Kew are at present only about 4 feet high, and are stemless, but they are graceful in habit, and quite as ornamental as the broad-leaved Calamuses, which they resemble somewhat. In the museum at Kew (No. 2) there is a very interesting collection of the products and peculiarities of this genus of Palms.

M. vitiense, Wendl. (*Sagus vitiensis*, Wendl.)—Fiji Islands.

M. amicarum, Wendl. (*Sagus amicarum*, Hort.)—Friendly Islands.

NANNORRHOPS, *Wendland and Drude*.

This is one of the six genera comprised in the dozen or so species of Palms which are popularly known in gardens as members of the genus *Chamærops* (see vol. xxiii., p. 410). The only species is *N. Ritchieana*, Wendl., which has been described by Griffith and others as one of the hardiest of Palms. Seemann wrote of it in 1856 as a small Palm, with a creeping trunk, and a much branched panicle. It grows in masses on the barren hills and passes below 5000 feet, leading up to the tableland of Afghanistan and Beloochistan. Its geographical area is from Baluchistan, through southern Afghanistan, the Kohat district, across the Indus, through the Salt-range, and beyond the Jhalum river, as far east as the Sivaliks Mountains near Dhimbur in Kashmir territory. It is supposed to be at least as hardy as *Chamærops humilis*, which it also resembles in its habit of forming tufts of erect-stalked, fan-shaped leaves. But there appear to be no large plants of it in European gardens, nor can I find any record of its having been properly cultivated in England till recently. It is to Dr. Aitchison, who accompanied the troops under General Roberts to Afghanistan in 1878, that we are indebted for additional information, and to Mr. Udney, B.C.S., Deputy Commissioner at Kohat, for the large quantity of fresh seeds lately received of this very interesting Palm. These seeds have been distributed from Kew among numerous botanic and private gardens and nurseries in England and elsewhere; it may be well, therefore to give here all the information we possess relating to this Palm. The accompanying figures (figs. 128, 129), copied from those given by Dr. Aitchison in the *Journal of the Linnean Society*, were drawn from a tree growing in the Botanic Gardens at Saharunpore.

Brandis refers to this tree in his *Forest Flora* (1874). He says:—"N. Ritchieana is generally stemless, the tufts of leaves arising from a creeping underground rhizome; but a stem grows up sometimes. Dr. Stewart records a specimen planted in the Saharunpore garden from seeds brought from Kohat more than twenty years ago, with a trunk 10—12 feet high." Dr. Aitchison speaks of its dwarf, stunted appearance on the higher hills as compared with its growth in the open valley, where it develops into a bush of from 5 to 7 feet in height, close masses of it extending for miles across the open plateau. Frequently, too, he says it may be seen occurring in sheltered places as a branching tree of from 15 to 25 feet in height. The greatest use it is put to, and in which its chief value consists, is in supplying the material for the manufacture of sandals, not only for the inhabitants of the country where it grows, but it is largely exported to surrounding tribes, with whom it is a regular article of trade. Europeans make a rope from it, and employ it for matting. Probably we shall find this Palm hardy enough to grow out-of-doors in the sheltered parts of England; it is certain to be happy in the South of France, Italy, &c., seeing that in the Kuram Valley, where it was found in such abundance, it is exposed to extreme cold and snow; in all probability in England it may, whilst young, require to be protected during spring from the bleak damp cold.

The stem is unarmed, as also are the petioles—a character which at once distinguishes it from *Trachycarpus* and *Chamærops*. The leaves are about 3 feet long, the petiole being half as long as the palmate blade, which is very stiff and leathery in texture, and of a whitish hue, owing to the fine powdery substance which covers it on both sides. Segments from eight

to fifteen, about 1 foot long, induplicate, deeply bipartite. Inflorescence erect, and paniculate. Fruit a roundish berry, covered with an edible pulp when fresh, and therefore eaten and called by the same name as Dates in Afghanistan (Aitchison). Seeds variable in size and shape—some round and large as bullets, others egg-shaped and smaller; surface smooth, dark brown, albumen horny, solid (probably hollow in dried seeds, as Brandis says they have "a large central cavity"). Seedling leaves erect, ensiform, rigid, glaucous. Judged by the plants at Kew this Palm is a slow grower when young.

In the museum at Kew there is a branching stemmed specimen of this Palm, which was brought from Afghanistan by Dr. Aitchison. The branching he

FIG. 129.—NANNORRHOPS RITCHEIANA: SHOWING BRANCHING STEM AND FLORAL DETAILS.

attributes to the arrest of the large inflorescence. The branches occur all along the stem, just as in an ordinary tree—say a Pear tree. I am indebted to Dr. Aitchison for supplying information as to the conditions in which this Palm grows wild, and the area over which it is distributed.

NINGA, *Wendl.*

The one species known, *N. pumila*, Wendland and Drude (syn. *N. Wendlandiana*, W. and D.), is a graceful little Palm, found in the Malay islands, and recently introduced as a decorative stove plant. It is described as having a tall, thin, annulated stem, bearing a terminal tuft of graceful pinnate leaves, with a three-sided short petiole, and has the general appearance of a *Geonoma* or *Ptychosperma*. When young the leaves are irregularly pinnate, and on the plants at Kew, which are only 2 feet high, there are basal clusters of offsets with bipartite leaves,

and the plants have the habit of the dwarf tufted *Geonomas*. The seeds are small, egg-shaped, reddish-yellow when fresh, smooth, with a fibrous husk, and a rumiated albumen. Seedling leaves bipartite. As a bright green, healthy-looking, graceful little Palm, which does not require much space, this *Ninga* is worth a place in stove collections. It likes liberal supplies of water and a rich soil. *H. Watson, Kew.*

FRUIT REGISTER.

SEA EAGLE PEACH.

This is the best all-round late Peach that I am acquainted with for outdoor culture. It is constitutionally a strong, healthy grower, and with me it never fails to set and swell an abundant crop of large and well-flavoured fruit. I picked my last dish of it from a tree on a wall having a south-west aspect on the 18th ult. Intending planters should make a note of this. Salway is undoubtedly the latest variety of the Peach in cultivation, and where a long season of Peaches is desired—and there are few places where they are not so desired, and fewer still where the accommodation is provided for the production of such a supply—a house should be planted with the Salway. It is a grand fruit when grown under glass, with sufficient fire-heat at command to thoroughly ripen the crop. Thus grown, the fruits—which when the trees are not over-cropped and are liberally supplied with liquid manure at the roots when swelling their crops, a taint to great size—are full of flavour, and highly coloured, being suffused with a rich golden hue; but when grown out-of-doors it is very seldom that fruits of this noble-looking Peach ripen satisfactorily, even in the most favoured districts, in which case the fruits should be gathered as soon as they became a little mellow, and be placed on the trellis over the front pipes, near the ventilators in a late vineery, to put flavour in them. *H. W. Ward, Longford, Salisbury.*

OUTDOOR GRAPES.

On an open wall, with a warm south aspect, here, several kinds of Grapes are grown, including Muscat of Alexandria, Black Alicante, Madresfield Court, and Frankenthal; all have fruited more or less; none bloomed more freely than the first named, indeed the Vine was quite a picture when in bloom, but of course it set badly. If any one would cross Sweet-water with Muscat of Alexandria perhaps a really good outdoor white Grape would be found. After seeing the samples of Grapes exhibited at South Kensington the other day from Hungary, I think that we could produce almost as good here in average seasons from open walls, but we should find them lacking in the flavour these Grapes displayed unless we could have Vines specially raised and fairly hardy. But whilst Muscat of Alexandria sets so badly, Black Alicante sets splendidly, indeed the bunches are dense clusters and colouring well. Next comes Frankenthal, and then Madresfield Court. Alicante, judging by the way in which it sets and colours here and in soil that is very poor and dry, seems as if it were well worthy of greater cultivation as an outdoor Grape. I am disposed to think that Vines for this purpose should not have indoor treatment, much less be raised or struck in heat. From the first they should be treated solely as hardy trees struck from cuttings in the open air, and so thoroughly seasoned to endure our summers, and encourage the production of hard ripe wood. I hope shortly to be enabled to show how Alicante sets and fruits outdoors here. *A. D., Bedford.*

PINE-APPLE GROWING EXTRAORDINARY.

Calling, on October 28, at the gardens of C. W. Lea, Esq., Parkfield, Hallow, Worcester, I found there the most meritorious lot of Pines I had ever seen, although by no means the first lot of good fruits seen there. I noticed a Smooth Cayenne recently cut, a perfect model of what a good fruit should be, with a crown of nice medium size, and which weighed 11 lb. 3 oz., whilst there were at least a score of others approaching ripeness, equal in beauty and size to this one, and others in various stages. All these younger fruits were on stems so stout, and the plants so stocky that they cannot fail to finish up as luscious, heavy fruits. A large proportion of the plants are Smooth Cayennes and Charlotte Rothschilds. These results were

obtained from plants of less than eighteen months in age, but the fine suckers were rooted into 8 inch pots, and shifted on immediately when ready into 12 or 14 inch pots. The compost was a good fibry loam, with a little bone-dust and soot, using liquid manure as a stimulant to growth. The Ficus are not the only hobby of the gardener, or the only instance of good culture on the place; on the contrary, everything is done well—notably Orchids (of which there are thousands), Grapes, Figs, Peaches, Bananas, stove plants, and Chrysanthemums. The gardens in every part are in excellent order, and reflect credit on the owner; and were it not for the unpretentious manner in which Mr. Brockington carries out his employer's wishes we should more often hear of the interesting things so well done at Parkfield.

P.S. It will be seen the above fruit beats by 7 oz. the weight of the supposed best on record: 7 cwt Welford Park, p. 584. *W. Crump, Madresfield Court.*

PEAR MARIE LOUISE.

We gathered on November 8 our last lot of this most useful variety, which will carry on the supply for some few weeks. I have gathered about five dozen weekly for some few weeks past, but owing to the sharp frost on the date mentioned above the remainder had to be gathered in. I generally rely on other varieties for the earlier supply, and am using at present Pitmasdon Duchess and Thompson's. The earliest batch of Marie Louise are just beginning to ripen, and are always with us most appreciated late in the season. Trees of Knight's Monarch grown in the orchard have carried enormous crops of large fruit this season here. *Edward Ward, Howell Gardens, Bromsgrove.*

Orchid Notes and gleanings.

CYMBIDIUM MASTERSII.

WITH the advent of the sunless season comes a number of the species of Cymbidium, keeping up a succession till spring, when *C. eburneum* makes its appearance. In several respects this species is comparable to the one under notice with regard to the shape of the sepals, petals, and the fragrance of the flowers. The fragrance of *C. Mastersii* is delicate and agreeable—at least during some of the stages of the flowers, and is generally considered to resemble that of *Almonds*. There is a figure of the species in the *Botanical Register*, xxxi., 50, where it was considered to be a native of the East Indies, from whence it was introduced in 1841. It is now supposed to come from Assam. The sepals and petals are rather narrow, and assume an ascending direction, giving the flowers a very distinct appearance from those of *C. Hookerianum*, with which the colour might suggest an affinity. The latter, however, is closely allied to *C. giganteum*, if not merely a white variety of it. The labellum of *C. Mastersii* is generally white, with the exception of the median ridge or lamella, which is yellow, and a few rosy spots. A specimen now flowering at Sir George Macleay's place, Pendell Court, under the charge of Mr. Ross, exhibits numerous rosy purple spots all over the interior of the lateral segments, together with the usual ones on the middle segment. Good rough peat, sphagnum, and sharp sand forms a good compost for this species, and it must not be allowed to get dry even in the resting season, although a considerably smaller quantity will then suffice.

J. F.

CYPRIPEDIUM SAUNDERSTANUM.

When I was at Mr. Lee's, in the most agreeable company of Mr. Day, we saw a splendid *Cypridium* of unknown parentage obtained from Mr. W. Bull. It was indeed the first flower. The peduncle was not long, the bract not well developed, yet the plant looked as if in very good spirits, and no doubt it will prove to be an uncommon beauty. The one parent was probably *C. Schlimii*, or *C. Sedeni*, but the other one?

Leaf like that of *Cypridium Sedeni*. Stalked ovary 5 to 6 inches long, velvety. Mauve purple flower grand, equal to that of a good *Cypridium villosum*. Median sepal oblong-triangular, whitish, with purple and green stripes. Body of united lateral sepals broader, wavy, white, green at the top. Petals

broad, ligulate, acuminate, undulate, incurved, falcate, fine purple. Lip shorter than the lateral sepals, very hemispheric in front, with some furrows at the anterior border of the mouth, full of asperities in front, fine purple-spotted on a white ground of the two lobes involved in the mouth. Stamens nearly square, bearded outside.

This may one day be a favourite with Orchidists provided more specimens appear. I look forward to its improvement in future.

I felt very pleased that it should be associated with the name of our lamented friend, a wonderful man in his ardent love of Nature and its treasures. *H. G. Rehb. f.*

CATASPTUM LONGIFOLIUM.

There is a figure of this handsome and remarkably striking species in Lindley's *Scutum*, t. 31. It is one of those Orchids that appear and disappear for more or less lengthened periods of time, but which for that very reason are all the more appreciated when they do present themselves in our hothouses. The inflorescence is cylindrical, many-flowered, and pendent, resembling in that respect some of the *Acinetas*. The sepals and petals are broad, the latter almost orbicular, overlapping one another, and all directed upwards so as to leave space for the remarkably pouch or bag-shaped labellum. The former are deep brown externally and much paler internally, forming a striking contrast to the deep orange interior of the labellum. The latter, strange to say, is deep brown externally, like the sepals, so that this organ must possess two layers of colour. The fringed auricles a little behind the orifice of the wide-open labellum is a very characteristic feature of the flower, and is suggestive of the mouth of some animal. The narrow grass-like foliage of the Kew plant is pendent, and 18 inches to 2 feet long, while in its native country the leaves are said to attain a length of 6-8 feet. The species occurs on the Eta Palm (*Mauritia flexuosa*), where that grows in marshy ground, often occupying extensive tracts on the river Demara, to the exclusion of other kinds of vegetation. It nestles on the trunk, where there are considerable quantities of decaying vegetable mould, and succeeds best with basket culture, hung up near the light, using a compost of peat, sphagnum, and charcoal. A specimen now flowering in the cool Orchid house at Kew is a curious and interesting object.

LÆLIA AMESIANA.

A lovely hybrid raised in Messrs. Veitch's establishment between *Cattleya crispata* and *C. maxima*. The leaves are evergreen, the flowers measure about 4 inches across, and have the sepals white with a pale flush of purple, and the lip a rich crimson, with a yellow throat. The plant flowers at various seasons. *Orchid Album*, t. 253.

LÆLIA ANCEPS PERCIVALIANA.

The flowers of this fine variety measure more than 4 inches across, the sepals narrow, lanceolate; the petals obovate, lanceolate, pale pink; the lip 3 lobed, basal lobes erect, reflexed in front; anterior lobe flat, spreading; magenta coloured, with a yellow throat. *Orchid Album*, t. 256.

CYPRIPEDIUM SELLIGERUM.

This was raised in Messrs. Veitch's establishment between *C. philippinense* and *C. barbatum*. The prevalent colour is reddish, the lateral petals are long, with tufts of blackish hairs. The plant blooms at various times of the year. *Orchid Album*, t. 255.

ODONTOGLOSSUM LUTEO-PURPUREUM.

The flowers of this fine variety are in racemes, and measure nearly 4 inches across. The segments are lanceolate, coarsely toothed, yellow with bold chocolate blotches. The lip is oblong, whitish, with a chocolate blotch and a yellow keel. The front of the column is fringed. It is a native of *Quindiu* at an elevation of 7000-8000 feet. *Orchid Album*, t. 254.

MASDEVALLIA RACEMOSA VAR. CROSSII.

Several varieties of this pretty cool-house Orchid, which was illustrated by us at p. 737, vol. xxi., are in bloom with Messrs. Shuttleworth, Carder & Co., of Park Road, Clapham. The term "little gem" is now rather a hackneyed one, but if ever there was an excuse for using it, it is in this case. The plants are neat, and of a peculiarly pleasing reddish-green, and the flowers vary in tint from reddish-scarlet to

crimson-orange. If Cross, Chesterton, and Carder, who separately ventured after the plant, could give us a recital of their discomforts while engaged in collecting it, every Orchid grower would buy a plant from pure sympathy. *Pleuronthallis macroblepharis*, the singular "midge Orchid," and many other good things are in flower in the same nursery.

CŒOLOGNE MASSANGANA.

Of this remarkably beautiful species there is at present a very handsome plant in flower in the nursery of Mr. B. S. Williams, Upper Holloway. It had on it five very vigorous spikes dependent from the Teak basket in which it was growing; one spike had on it twenty-six flowers. This is a vigorous-growing species, and where a few plants of it can be suspended in a corner of the warmest house, it may be had in flower at all seasons, and the long drooping spikes have an excellent effect. *J. D.*

The Flower Garden.

THE sharp nip of frost and the downpour of rain have almost cleared the trees of leaves. A general clean-up, therefore, should now take place. It is a common practice to rake out all the leaves from beds of American plants and shrubberies, and then dig them over. This is a great mistake, for a rake, fork, or spade should not disturb such beds. The majority of such plants root close to the surface, and the leaves that accumulate under the plants afford both protection from frosts and from drought. If the leaves be covered at this time of year with a couple of inches of soil to prevent them blowing about the plants annually receive a suitable top-dressing which is ample to sustain them in vigour. All lawns, verges, and walks should be thoroughly swept and rolled. Where moss exists on lawns and where lime is cheap the best possible eradicator is available. Slack the lime until it becomes a fine dry powder, and then give a liberal dressing. The next best plan is to rake over the lawns with an iron-toothed rake; this is best done twice, allowing an interval of ten to fourteen days to elapse before the second raking. A good top-dressing of sifted soil should then be applied, and some fine lawn grasses be sown in spring. This may be undertaken at once, but of course the lawn will look little better than a newly harrowed field and where this is objected to, by all means defer the work until spring.

Where inequalities exist, they should be seen to; remove the turf, at the same time also as much of the good soil as is deemed necessary, so that the growth of the grass afterwards may be equal. Then remove the subsoil from the high places to the requisite depth and cover what is required to make the deficiency at the low place; replace the good soil and relay the turf. The formation of new grounds may now be undertaken as well as alterations of existing ones. Continue the removal of all kinds of deciduous trees and shrubs when the weather is favourable. Where it is necessary to provide shelter in exposed situations, a hedge is preferable to a wall; a gate of wind will sweep over a wall in unbroken force, or eddies will be created; with a hedge there are no eddies, the wind is completely broken up—the hedge, serving as a filter, completely destroys its force. It may be objected to on account of its formality; it need not be stiff or formal—a series of wavy lines may be introduced here and there, or beds of Dahlias or Hollyhocks: the most serious objection is that whatever you plant near it always extracts its share of nutriment. Old tree stumps and decaying trees may be made objects of interest as well as beauty by planting various kinds of Ivies and Ampelopsis to cover them. This serves to give an air of antiquity to a place. *Ampelopsis tricuspidata* Veitchii is by far the best subject for this sort of work; Honeyuckles are also most useful. *W. M. Baillie, Luton Hoop Gardens.*

PRESERVATION OF GRAPES. — M. Paul Sagot describes the plan adopted by M. Salomon for preserving the Chasselas Grapes from one year to another. The bunches are cut in the ordinary way with a portion of the stem, which is inserted in a bottle of water, and the bottles are then placed in a refrigerating chamber wherein the temperature is kept low by the evaporation of methyl chloride; the light is also excluded.

THE ORCHID HOUSES.

PLEIONES.

SOON after the flowers have faded this Orchid should receive attention as may be required either by repotting or top-dressing. If the roots from the new growth advance much before this be done, they are easily damaged. I make it a rule to shake the plants out once in two years, and at other times clear the surface only, and shake some decayed leaves over and top-dress. For potting, equal parts of fibrous peat and green sphagnum, to which a few lumps of loam and some half-rotten Oak leaves that have been broken rather fine or rubbed through a half-inch sieve has been added, suits them very well. They should be suspended or placed near the glass at the warmest end of an intermediate-house. For some weeks the plants will require very little water, only just enough to keep the surface moist, but after they have made plenty of roots and foliage, water can be given freely. See that the old bulbs are clear of scale, for these insects will soon attack the new growths.

THE PHALENOPSIS-HOUSE.

During the last few weeks this house has been looking gay with *Dendrobium bigibulum*, *D. superbiens*, *D. s. Goldiei*, *D. Phalenopsis*, and *D. formosum giganteum*; the large white flowers of the latter making an agreeable contrast with the other bright colours. As the plants finish up their pseudobulbs they should be placed in a cooler and drier house until spring. If *D. formosum* shows no sign of shrivelling they will not receive any water during the winter.

ODONTOGLOSSUMS.

Odontoglossum grande, *O. Islayi* and its varieties, should be kept almost dry as soon as the pseudobulbs have finished up; a house a few degrees warmer than that for cool Odontoglossums will suit them best.

In badly constructed houses in the warm division, drip will be very troublesome through the cold season, and although this might not prove injurious to Cypripediums, there are many species of Orchids, such as *Acerides*, *Saccolabium*, *Vandas*, &c., which retain the water, often causing the centres to rot, that greatly disfigures the plants through having to make a new break at the side. Constant dripping on the potting material of any Orchids during winter, might at first improve the appearance of the plants, but in the end the roots generally die. The growing sphagnum is often a good guide, so that those whose duty it is to water the plants should take particular notice, for if any of the moss should appear extra fresh and green, and the plants never require any water, they may conclude that drip is helping the sphagnum but not the plant. Where bars and rafters are not properly grooved, a simple way to prevent drip is to have some strips of zinc a little wider than the bars and rafters, with the edges slightly turned, and screw these tight to the underside. *C. Woolford, Downsville, Leatherhead.*

PLANTS AND THEIR CULTURE.

PELARGONIUMS.

THOSE plants intended to bloom early should now be put into their blooming pots, using turfy loam well enriched with manure, and avoid over-potting—8 or 9 inch pots will be large enough for growing good specimens. In potting the soil should be rammed harder than most plants need—it should get no water for two or even three weeks, so as to allow the roots to penetrate somewhat the new soil. Be particular in having the balls moderately moist before potting. All plants required for specimens should now have the shoots tied out horizontally, this will give the proper foundation for a bushy form, but for ordinary decoration purposes alone, no more sticks should be used than will preserve the plant in form. The fancy and decorative varieties do best in a temperature a little warmer.

HERACEOUS CALCCEOLARIAS.

The earliest of these may now be put into their blooming pots; if the plants are bushy and strong they may be put in, from 9 to 11-inch, and in these, large size specimens can be grown. If *Calceolarias* are grown in rich soil, and given manure-water

occasionally, and plenty of pot-room be given, the trusses of bloom as well as the foliage will be much increased in size. The best soil for these is a fibrous loam, with one-fifth of coarse leaf-mould, one-third of rotten manure, adding enough coarse river sand to render the compost porous.

PRIMULAS.

The first potted plants will now be showing bloom; in all sowings there are some which are much superior to others, and these if selected as seed bearers should have the blooms pinched out, as it is much too soon for them to form seed freely. Apply manure-water at every alternate watering.

CYCLAMENS.

should be introduced into heat from the reserve pits; seeds which ripened in July, and were sown at once, will now have made nice young plants, requiring to be potted off into small pots and placed in a gentle heat. In this way they are kept growing freely from the time the seeds germinated until that of flowering, and good plants should be obtained in sixteen months, from start to finish.

CINERARIAS.

Plants which were raised late should now be shifted into their blooming pots, for if these are left to get pot-bound, they will not move freely afterwards.

VIOLETS.

Roots of these which were taken up early last month are now blooming freely, and care should be taken to dispel damp by ventilating freely; and if too many runners appear, they should be reduced in number, and the plants should be well looked over for decaying leaves. Those plants which were potted up must be kept near the light and air.

Where sweet-scented flowers are in request, a regular supply can be kept up from the following—*Heliotrope*, *Mignonette*, *Aloysia citrodora*, *Myrtle*, and many species of *Cape Pelargoniums*, as the *Rose*, *Peppermint*, and *Nutmeg* scented.

CARNATIONS.

in pits should have occasional applications of manure-water; air should be admitted freely on favourable days, and as plants are taken out for finishing purposes; refill from the frames or the reserve. Old plants which are not of symmetrical shapes will be found useful as affording a quantity of bloom very suitable for buttonhole flowers and the like uses. *A. Evans, Haslemere.*

FRUITS UNDER GLASS.

VINES IN THE EARLY HOUSE.

THE Vines in this house, if not already attended to as recommended at p. 431, should be seen to at once—that is, if ripe Grapes are expected by the end of April or early in May next. In most cases the Muscat Vines will have shed their leaves, so that the sooner the bunches of this excellent Grape are cut with a good length of wood attached for inserting in bottles nearly filled with water, and having a few small pieces of charcoal in each to keep the water sweet, the better it will be for the Vines and the Grapes too, providing there is a suitable room in which to place the bottles on shelves at an angle of about 20°, and in which a dry atmospheric temperature of from 45° to 50° can be maintained throughout the winter and spring months. The bunches should be looked over frequently, removing any decayed berries. When the piece of shoot attached to the individual bunches of Grapes has been inserted in the bottles, the space left in the neck should be packed with cotton wool to prevent evaporation taking place.

Late varieties, such as *Lady Downe's*, *Mrs. Pince*, &c., which are still hanging on the Vines—where, for the sake of the Grapes, it will be advisable in properly constructed and managed houses to allow them to remain a few weeks longer—should also receive attention in the way of removing forthwith any bad berries that may appear in the bunches. Maintain a dry atmosphere in the houses in the meantime, and a minimum temperature of from 45° to 50° therein should be aimed at. After the Grapes have been cut in the Muscat house prune the Vines back to a good plump bud, removing at the same time any unsightly spurs that may be on the Vines, wherever young shoots of this year's growth from the main stem are procurable to take their place, and these

should be cut back to one bud from its base. The washing of the Vines, cleansing of the house, top-dressing of borders, &c., should then be proceeded with in the way advised in the *Gardeners' Chronicle* for October 2, p. 431, and an abundance of air should be afterwards admitted to the Vines until the time (New Year) for starting the Vines arrives. *H. W. Ward, Longford Castle.*

The Kitchen Garden.

GENERAL WORK.

DURING the present month all remains of summer crops that are done with, such as Peas, Beans, &c., should be cleared off, and either burnt on the ground, or otherwise disposed of, and the garden made as tidy in appearance as the season of the year and circumstances will permit; Pea-stakes that were new this season, will be available for staking the earliest spring sowings, and should therefore be looked over, assorted, tied up in convenient bundles, and placed in readiness. During inclement weather such requisites as stakes, labels, &c., likely to be required next season, should be got in readiness, prepared, sharpened, and the bottom ends dipped in creosote, to render them more durable and lasting. Seed Potatoes should be looked over, and all worthless and decayed ones removed; any showing undue excitement, must be more thinly spread and receive more air; early varieties, especially those intended for planting in frames and early borders, are best on end in shallow boxes, and stood in a dry airy situation secure from frost.

Onions.—These also will require overhauling and cleaning, removing all surplus scales and withered tops, samples of the Brown Globe section, intended for very late use, are best tied up in traces or bunches, and suspended in a dry airy shed. All stored roots should be occasionally looked over to ascertain if they are keeping in a satisfactory state, removing any that have become decayed and worthless.

Out-of-doors.—Trenching and digging should be done, whenever the state of the ground will permit. In light well drained soils this work can be proceeded with at almost any time, but in the case of stiff heavy soils, it is much better and necessary to await favourable opportunities, and until the soil has become freed of the surface water, and in a fit state. The surface of all newly turned-up ground is best left as open and rough as possible, and any plots known to be infested with wireworm, or other insect pests, should receive a good top-dressing of gas-lime, soot or salt, the latter being best adapted for light soils, and the former for heavy ones; these top-dressings should be allowed to wash in by the winter rains, thereby answering the double purpose of destroying and clearing the ground of insects, and also acting as a fertiliser for the next crop.

THE FRAME GROUP.

Methods for early Carrots, Radishes, &c., will soon be required, material for the purpose should therefore be got together as advised in a previous Calendar. The main object being to secure a steady continuous flow rather than a quick violent one, some labour and preparation beforehand, and also in the construction, will be necessary to ensure these very essential conditions. Leaves and dung litter in equal proportions make the best and most desirable mixture for the purpose. Presuming that these have been thrown together for a time, and prepared by being thoroughly mixed and turned on several occasions, the bed can be made up, having first marked out the required space, which should extend 2 feet on either side of the frame, the base should be formed with a foot of dung litter, and the bed built up and completed to the height of from 4 to 5 feet with the prepared material, raising it regularly by layers, and levelling and firming the surface as the work proceeds by the use of the fork only. When the bed is sufficiently high, lengths of stout stakes or poles should be laid crossways on the surface 4 feet apart, and extending far enough underneath to rest the frame on. The lights and frame having been placed in position, a few days should be allowed for settling, when, if necessary, a little more material can be added, the soil put in, and left in readiness for planting or sowing.

HERBS.

Any of these required for use in a green state should be placed in a gentle heat, and if not prepared beforehand by being grown through the summer in pots or boxes, must be lifted from the herb garden now, and prepared accordingly; these will comprise such useful kinds as *Spearmint*, *Tarragon*, *Sorrel*, *Chervil*, and *Farsley*; a few seeds also may be sown of *Sweet Herb Borage*, and *Knotted Marjoram*. *John Austen, Witley Court Gardens.*

Appointments for the Ensuing Week.

SHOWS, &c.

MONDAY, Nov. 22. Leeds Chrysanthemum (two days). Borough of Hanley Chrysanthemum (Oxford do.).

TUESDAY, Nov. 23. Royal Botanical and Horticultural of Manchester do. (two days). Liverpool Horticultural Association do. (two days). Birmingham and Midland Counties Chrysanthemum and Fruit do. (two days).

WEDNESDAY, Nov. 24. National Chrysanthemum Society Meeting.

THURSDAY, Nov. 25. Colchester and East Essex Chrysanthemum.

S A L E S.

Sale of Dutch Bulbs and Dwarf Roses, from France, at Stevens' Rooms.

MONDAY, Nov. 22. Sale of Dutch Bulbs and 5000 Lilium auratum Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Plants, &c., at the Ealing Dean Nursery, by Protheroe & Morris.

TUESDAY, Nov. 23. Sale of Dutch Bulbs, at the City Auction Rooms, by Protheroe & Morris. Sale of Imported Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, Nov. 24. Sale of Shrubs, Roses, Border Plants, and Dutch Bulbs, at Stevens' Rooms. Sale of Plants, at Protheroe & Morris' Rooms.

THURSDAY, Nov. 25. Sale of Established Orchids and 10,000 Bulbs of Lilium auratum, at Stevens' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, Nov. 26. Sale of Imported Orchids, at Protheroe & Morris' Rooms.

SATURDAY, Nov. 27. Sale of Shrubs, Roses, Border Plants, and Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

FOR the last two or three years, as we have on various occasions had to note, Messrs. SUTTON have been engaged in extensive experiments in crossing Potatoes. Apart from matters of scientific interest, Messrs. SUTTON have aimed at the production of new varieties of Potato which should, by their internal structure and conformation, and by their robust constitution, be in a position to resist the attacks of the disease better than ordinary varieties do. For this purpose they instituted a series of experiments in cross-fertilising what was supposed to be Solanum Maglia with the pollen of approved kinds, such as one of Mr. FENN'S seedlings, now known under the name of Sir Charles Douglas. The results of these experiments up to this time last year were duly recorded in our pages. The seedling varieties thus obtained were again grown this year, with results that we shall presently mention. In the meantime it has been discovered that the "Maglia" they supposed themselves to have been operating on is not really that species, but a form of the ordinary Solanum tuberosum grown at Kew for many years, without any special cultivation. The mistake is in one sense unfortunate, for as the Maglia or Darwin Potato is considered to be a distinct species, inhabiting the relatively cold and wet maritime climate of Southern Chili, it was hoped that, by breeding from it, seedlings might be obtained more likely to thrive in our own relatively cold, moist climate, than others the descendants as is supposed of a form or forms growing naturally along the Andes at greater elevations and in a drier climate.

A cross between two reputedly distinct species would of course result in a true hybrid, while fertilisation between two varieties or forms of one and the same species, would simply result in a cross. The difference is thus one of degree only, and not of kind. Messrs. SUTTON have been engaged in cross-breeding and not in hybridisation proper. From a practical point

of view, solely, Messrs. SUTTON are likely to obtain better, or at any rate more immediate results than if they had been operating with a real hybrid. From a scientific point of view, of course, the results are less interesting than they gave promise to be, but there is nothing to prevent Messrs. SUTTON from beginning *de novo* with the true Maglia, which is cultivated at Kew, and this we earnestly hope they will do, for although the attainment of any practically useful result will be probably slower, yet we can hardly doubt that in the long run it would be more important, even from a purely practical point of view. For the results of the experiments made in 1885 we must refer to our article on October 24, 1885 (p. 528), wherein the immense amount of variation in the seedling tubers in productiveness, size, colour, nature of haulm, and other points, is clearly brought out.

We have now to deal with the results of this year's experiments. Messrs. SUTTON planted the seedling tubers this year in the same way, and under the same conditions, as before, so that the only practical difference in the surroundings was that attributable to variation in the character of the season in the two years respectively.

Messrs. SUTTON have favoured us with a table giving the amount of produce in 1885 derived from each grain of seed, and side by side the amount of the produce derived from planting the crop of 1885 during the present season. Thus, taking No. 8 as an example, one grain of seed produced tubers in 1885 of the weight of 11 oz. These tubers have this year yielded 56 lb. 2 oz.

Results of Crosses in 1885 and 1886.—Percentage Seed-weight Potato, 5, 6 of Parent & Fenn's Sir Charles Douglas, Pollen Parent.

No.	Produce, 1885.	Produce, 1886.

Last year we were enabled to give also details as to height of haulm, roughness of skin, colour of tubers, &c., which we should have liked to have given this year also. No doubt Messrs. SUTTON'S records will supply the required data. The extraordinary difference in the results may be illustrated by example No. 5, which last year yielded 3½ oz., while this year the same variety yielded no less than 54 lb., and No. 17, which last year yielded 1 lb. 5½ oz., this year stands credited with 122 lb. 6 oz.

A second series of experiments were made by Messrs. SUTTON in 1885, by crossing the Kew tuberosum with the pollen of Reading Russett and by crossing tuberosum with the pollen of Victoria. The results as regards weight are far more promising than was the case where the male parent was one of Mr. FENN'S seedlings. A similar cross between tuberosum and WALKER'S Regent failed to give any result.

Varieties: Semi Wild Parent, Seed Parent & Reading Russett, Yellow Yew.

No.	Lb. oz.	No.	Lb. oz.
1	0 2	12	0 10½
2	5 15	13	0 8

27	5 8½
29	1 13

An interesting experiment was conducted with cuttings—interesting in itself and important, because it proved that what Lord CATHCART and Messrs. SUTTON had grown for Maglia was in reality tuberosum.

Mr. SUTTON took twelve cuttings from Lord CATHCART'S Maglia (the form of tuberosum grown at Kew without special cultivation), and twelve from the true S. Maglia. The cuttings rooted, and after seven or eight weeks Lord CATHCART'S plants died down, having produced small tubers, while the true Maglia cuttings are still growing, and showing their characteristic foliage, and have produced their elongated flower-stalks.

In spite of the unfortunate error above referred to, and for which neither Lord CATHCART nor Messrs. SUTTON are responsible, the interest of these experiments is very great. We trust Messrs. SUTTON will not only continue them, but continue to record as fully as possible all the details of their experiments. To arrive at an immediately practical result may demand a long period, but systematic experiment on a carefully thought-out plan, and with a definite aim in view, cannot fail to be productive of good results. It is where the unsystematic, happy-go-lucky experiments in which everything is left to chance, that useful results are slow in coming.

As an illustration of the great productiveness of some varieties, the following fact may be cited. From one seed (not tuber) of Magnum Bonum, sown on March 12 of the present year, a plant was raised which produced thirty-two tubers, of the aggregate weight of 6 lb. 9½ oz., the two largest weighing 1½ oz. and 1½ oz. respectively. Talk of causing two blades of grass to grow where there was only one previously! We were not wrong when, last year, we spoke of Messrs. SUTTON as the Magicians of Reading.

PANDANUS VARIEGATUS.—We are accustomed to see this plant making part of a group of stove foliage plants at our exhibitions, where its foliage, with bands of green and white, are very effective, but few of us have been privileged to see a plant of the size of that figured at p. 657 (fig. 130). This was planted at Kingston, Jamaica, in 1876, by our correspondent, Mr. HART, and has now attained a height of over 30 feet. The huge branches, each tipped with its spiral tuft of leaves, and the thicket of aerial roots set down from the stem as buttresses to support the weight of the crown, are very striking.

M. BERNARD.—We learn that our Belgian friends are in consternation at the death of M. C. BERNARD, Director of Agriculture, an office corresponding, we presume, to our permanent Secretary for Trade.

FLOWERS IN SEASON.—Although this is a dull time of year, there is a varied selection of flowers from which one may choose flowers according to taste. Chrysanthemums, of course, take a prominent place, and are followed closely by Heaths, berried Solanums, Marguerites, Pelargoniums, Chinese Primulas, Cyclamens, and Bouvardias. Flowers from the various bulbs are beginning to show themselves, the Paper-white Narciss, Roman Hyacinth, and small Tulips being plentiful in the shops round about us. Of choice flowers may be named Eucharis, Azalea, Lapageria, Gardenia, and several Orchids. A welcome arrival is white Lilac (from abroad, probably), which of course is forced. All the foregoing, with Camellias, Niphetos Roses, Allamandas, Cliveas, and Violets (the Czar and the Parma forms), constitute the chief flowers at present procurable. We notice, too, flowers which we hardly expected to see at this season, such as the blue Cornflower and the Sweet Sultan.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are informed by Mr. E. R. CUTLER, the Secretary of this institution, that Baron FERDINAND DE ROTHSCHILD, of Waddesdon Manor, M.P. for

the Aylesbury division of Buckinghamshire, has kindly consented to preside at the 44th Anniversary Festival of this Institution at the "Albion," Aldersgate Street, on Friday, July 1, 1887.

— **FAILURE OF THE WINTER SPINACH CROP.**—Winter Spinach is now very scarce, owing to the failure of the crop to a large extent, the leaves turning yellow and becoming worthless. One experienced grower attributes the failure to a great extent to grow-

— **TOBACCO.**—The crop of Tobacco grown by Messrs. CARTER & Co. is said to weigh three-quarters of a ton, and to be of the value of £42.

— **EUCALYPTUS.**—Mr. W. E. DIXON lately read a paper before the Scottish Horticultural Association on the Eucalyptus, in which he sketched briefly the characters and the botanical history of the genus, alluded to the species of greatest importance for timber, medicinal products, paper-making, &c.,

exhibition on April 30, 1887, and that the whole of the proceeds, after paying expenses, shall be devoted to the funds of the Leek Cottage Hospital.

— **CARTER'S PROVIDENT SICK FUND.**—The first annual meeting of subscribers was held on Monday, the 8th inst., at Messrs. JAMES CARTER & Co.'s, High Holborn, and was attended by about 200 members. The chair was occupied by the manager, Mr. C. H. SHARMAN. The report and

FIG. 130.—PANDANUS VARIEGATUS IN JAMAICA. (SEE P. 650.)

ing the crop in freshly manured ground. That winter Spinach needs rich soil to bring it to perfection there can be no doubt, but it is best to sow it on land that had been previously manured for a light crop of some kind.

— **THE SURVEYORS' INSTITUTION.**—The next meeting will be held on Monday, November 22, when a paper will be read by Mr. J. W. WILLIS BUND (Associate), entitled "The Extraordinary Tithe and its Redemption." The chair to be taken at 8 o'clock.

and mentioned the species that are cultivated in this country.

— **ROYAL MICROSCOPICAL SOCIETY.**—The next *conversazione* of the Society will be held at King's College, Strand, on Wednesday, the 24th inst., at 8 P.M.

— **LEEK AURICULA SOCIETY.**—The general annual meeting of the above Society was held on November 16 at Leek, when, after transacting the usual business, it was decided to hold the second

balance-sheet for the past year was read, adopted, and resolutions for amending existing rules were passed. During the twelve months of the Society's existence 268 members were enrolled, all of whom were employed in various departments of the business. By payment of a small weekly subscription benefits in case of sickness, varying from 6s. to 18s. per week, are secured, and it was considered highly satisfactory that after paying fifty-one claims for sickness and one for death the Society entered upon its second year with a very substantial balance in hand. After appropriating a suitable amount as a working reserve fund it was

resolved unanimously to make a donation of £5 to the Hospital Saturday Fund, and to distribute any surplus amongst the subscribers. The officers and members of the committee were re-elected, and the proceedings terminated with a vote of thanks to Messrs. JAMES CARTER & CO. for a further donation, which they had spontaneously offered upon seeing the satisfactory result of the first year's working of the Society.

— *CRATEGUS PINNATIFIDA* VAR. MAJOR.—We are desired by Mr. N. E. BROWN, to whom we are indebted for the description of this plant, to publish the following correction:—"In the description of this plant on p. 621, by a slip of the mind, I stated that both the typical form and the variety are natives of North America; this is wrong, it should read—both are natives of North China."

— GHENT "CHAMBRE SYNDICALE."—At a meeting held on the 8th inst. the following awards were made:—

First-Class Certificate.—To Mr. Hye-Lyenet, for *Cypridium curvandum*; to Mr. Arthur De Smet, for *Cypridium Argus* var. nigro-maculatum; and to Messrs. Vervaeck & Co., for *Phalaenopsis Lowii*.

Cultural Certificate.—To Mr. Lievin Spaevander Meulen, for *Cocos Blumenavia*; to Mr. Jules Hye, for *Cypridium Dominianum* and *C. caudatum splendens*.

Commendations for Novelty.—To Mr. Ad. D'Haene, for *Oncidium Forbesii* var. (for its habit and also for its colour); to Mr. L. Van Houtte, for *Tillandsia species nova*; to Mr. L. Spaevander Meulen, for *Cypridium Spicatum* var.; to Mr. De Smet-Duwivier, for *Dracena Briantii*.

Commendations for Culture.—To Madame Van Acker-Maenhout, for *Pavetta borbonica*, to Mr. L. Spaevander Meulen, for *Pandanus ornatus*; to Mr. Em. De Cock, for *Kentia Fosteriana*; to Messrs. Vervaeck & Co., for *Cypridium Selenei* x, and for *Dendrobium thrysiflorum*; to Mr. B. Spaevander Meulen, for *Vriisia heterophylla*; and to Mr. Jules Hye, for *Cypridium levigatum*.

— HOT WELLS.—The *Indian Agriculturist* for October 21 states that a remarkable example of the increase of temperature in the earth toward the centre has been presented at Pesh, where the deepest artesian well in the world is now being bored for the purpose of supplying the public baths and other establishments with hot water. A depth of 951 metres—3120 feet—has already been reached, and it furnishes 800 cubic metres—176,000 gal.—daily at a temperature of 70° C., or 158° Fahr. The Municipality have recently voted a large subvention in order that the boring may be continued to a greater depth, not only to obtain a larger volume of water, but at a temperature of 80° C.—176° Fahr. It is suggested that it is thus within the bounds of probability that the time may come when a brewer will obtain his water supply from a well of sufficient depth to yield "liquor at the mashing temperature."

— POTATO TRICENTENARY, 1836—1886.—The executive committee of this exhibition, to be held at 5, St. Stephen's Hall, Broad Sanctuary, Westminster, S.W., December 1 to 4, 1886, consists of the following gentlemen:—General Lord Alfred Paget, John Bertram, Esq., C. C.; T. H. Bolton, Esq.; Captain Moleworth, R.N.; A. Bevan, Esq.; H. Roberts, Esq.; Hon. Secretary, Mr. W. E. Wood.

— MR. DOUGLAS DICK.—A presentation to Mr. J. DOUGLAS DICK, superintendent of entrances at the recent Colonial and Indian Exhibition, was made on Thursday last. The presentation consisted of a handsome drawing-room clock, and was formally made, on behalf of the members of Mr. DICK's staff, by Sir PHILIP CUNLIFFE OWEN. Mr. DICK's colleagues desired to bear testimony in this way to his "kindness and courtesy during the series of Exhibitions held at South Kensington 1853 to 1886."

— MR. C. E. BROOME.—We greatly regret to have to announce the death, on the 15th inst., of Mr. C. E. BROOME, a very old correspondent of this journal, and the associate of Mr. BERKELEY in numerous publications relating to fungi. Mr. BROOME was in his seventy-fifth year.

— GARDENING APPOINTMENTS.—Mr. JAMES COCKER, for thirteen years Gardener to GEORGE URE, Esq., Wheatlands, Etonbridge, as Gardener to Sir WILLIAM WALLACE, Lochryan House, Cahirvan, Stranraer, N.E., Mr. A. SMITH's successor at Wheatlands.—Mr. SAMUEL TAYLOR has been appointed as Head Gardener to the Bishop of GLOUCESTER and BRISTOL, Palace Gardens, Gloucester.

FORESTRY

LIBODERUS DECURRENS.

THIS rapidly-growing gigantic tree, better known under its older name, *Thuja gigantea*, is fast coming to the front as a timber tree in Britain; and well it may, for its rapid clean growth in this country, combined with the valuable timber produced in its native wilds—good examples of which were to be seen at the Colonial Exhibition—place it in the first rank for commercial purposes. In this country the growth often exceeds 3 or 4 feet in the year. The tree is readily raised and transplants well; it is by no means fastidious about soil, and I cannot remember, even in a single instance, and when fully exposed to our fearful south-western winds, to have seen a leading shoot broken over or destroyed.

MISCELLANEOUS SPECIES.

Amongst other valuable trees we will notice very briefly *Abies Nordmanniana*, a fine, robust-growing species, and one that is easily managed in this country; *A. nobilis*, and *A. (or Picea) Menziesii*, both valuable trees for our soils and climate; and *Cupressus macrocarpa* or *Lambertiana*, that produces a fine, hard, clean-grained timber, and which is invaluable for exposed seaside situations. Many other valuable trees might be mentioned, but those given are, perhaps, about the best for the purpose at present under consideration. Hardwoods will receive future attention.

HOW TO PLANT.

This is another operation, connected with forest work, that has the usual multitude of ways being performed, all of which methods are perhaps good enough in their proper place; but herein lies the difficulty, viz., to plant young trees in such a manner as to be consistent or in keeping with their surroundings.

Notch-planting for mountain ground is just as much worthy of commendation as is pit-planting for low-lying land. The latter is an expensive method, but this first expense is soon repaid, for once the young plants get fully established their growth is rapid, usually more so than such as have been notched, even in soils of equal quality. In connection with notch-planting the expenses are low indeed—a man, and a boy as attendant for putting in the plants, getting over a considerable surface of ground in a day, and where the soil is shallow and small-sized plants used the method is to be commended, as these can be placed more firmly in the ground than if planted in pits; and another advantage is that the grass affords shelter to the young plants until they have started fairly away. From 23 to 3 feet is the usual distance at which notch-planted trees are usually placed, and the operation is performed as follows:—With an ordinary garden spade make two deep cuts upon the turf where the plant is intended to be inserted, and crossing at right angles exactly at where the plant is to be put in; press down the handle of the spade nearly to the ground and towards the planter, which will cause the slits to open and into which opening the plant is to be inserted by the boy in attendance; the spade is then removed, but not before the roots have been well spread out, and the turf will resume its original position, but to insure its doing so, and likewise to prevent the ingress of air, a firm tramp must be given where the cuts intersect each other. Great care should be exercised in notch-planting, for if the notch be not carefully closed the plants are sure to suffer by the admission of too much air and water to the roots.

In pit-planting the holes should be formed of such a size that the roots of the trees to be inserted can be spread out to their full extent, all cramping, twisting, and bending of these being carefully guarded against. Loosen well the sides and bottoms of the pits with a pick, and, if possible, have them opened for a few weeks previous to the plants being inserted, the freshly turned-up soil being much improved by exposure to the weather even for a few days.

Planting should next be carefully gone about, the trees being first placed erect, their roots spread well out, and equally around the stem, and all covered with soil, remembering to bring the soil and roots in contact, for vacant spaces left around the stems and roots are productive of anything but good. Trample the soil firmly but not too hard around the stem, and

do not insert the plant at a greater depth than it stood when it was in the nursery ground. For the ordinary ran of forest stuff, say Larch, Scotch, Silver, and Spruce Firs, of from 18 inches to 3 feet in height, the pits need not be made of larger size than 1 foot square, or, better still, circular, and 18 inches in diameter. By picking the soil around the pits, inclining the tool outward, a larger base, but with the original sized top, is made, and thus extra space is allowed for the roots of the plants. About 4 feet from pit to pit will be sufficiently close for the size of plants just stated. When dealing with the inserting of the plants we should have stated that it is wise policy to always incline the tree's head to the point from which the north winds blow, and to place on the opposite side a square of turf, which should be tramped firmly against the tree's stem, so as to prevent as much as possible rocking and its attending evil results.

Placing stones, as is too frequently done, against the young tree, cannot be too strongly denounced, for the bark thus becomes chafed and broken, when decay sets in and ruins the constitution of even the strongest specimen. *A. D. Webster, Penrhyn Castle, North Wales.*

RABBITS ATTACKING TREES OF PINUS LARICIO.

Permit me to express a doubt as to the experience of Mr. Archdale, Crook-na-Cruin, Ballinamallard, regarding the Corsican Pine (*Pinus Laricio*) being more liable to the attacks of rabbits than any other kind of plant. I have during a pretty extensive experience planted the *Pinus Laricio* very largely, even where rabbits were pretty plentiful, and I have always found in a plantation of mixed plants, say, Scotch Fir, Larch, Spruce, and hardwood, with the exception of Ash, the *Pinus Laricio* was generally the very last plant they would touch. On the other hand, the *Pinus austriaca* was generally destroyed first; in fact in some cases I have planted *austriaca* so as to save the other plants, by allowing the herbage time to rise in order that the main crop might be partially protected.

I am therefore inclined to think that Mr. Archdale must have planted *Pinus austriaca*, instead of *Laricio*, as they are very closely allied: it is just possible that the one might be mistaken for the other—if not, I must say that his experience does not accord with mine nor with the experience of many authorities on the subject. *C. S. F.*

THE ORCHARD HOUSE.

MISCELLANEOUS FRUITS.

AT this season of the year but little attention is required; in fact, none at all as regards the trees. Those who live in very wet districts will do well to leave their trees in the house. In dry, favourable districts I advocate as the result of twenty-five years' experience that they should be plunged out-of-doors in fresh cocoa-fibre refuse. The way in which the roots work in the pots when plunged shows how well this material agrees with them. The retopping and top-dressing should be finished by this time, and if it has not been done, see to it at once. Either operation is simple enough, and both have been explained in previous numbers. Scale is sometimes rather troublesome. Now is a good time to look over the trees to clear it all off, and well wash the places where it has been clustering with soapy water.

ORANGES.

In gardens where the luxury of an Orange house can be afforded, it is easy to maintain a supply of well-flavoured Oranges for a very long period. The trees are less trouble when planted out, but they are more manageable in pots. The fruits of the early Tangierine variety will now all be gathered, and the St. Michaels, with a few of the Malta blood, should be in season. It is very seldom indeed that the trees can be kept clean all through the summer and autumn months. Examine them now, and wash off all the scale with strong soft-soapy water. Any trees on which the fruit is not ripe should have now a temperature of from 60° to 65° as a minimum. The atmosphere ought to be only moderately moist. The plants should also be well exposed to light, and the ventilation be ample without exposing the plants to a draught. *Fas. Douglas.*

The Apiary.

SOME very curious and great mistakes are often made about bees in bar-framed hives as distinguished from bees kept in skeps. It seems almost a part of the modern beekeeper's existence to be suspected of crafty dealings by his less skillful neighbours. I have frequently determined to write a short piece about this for the benefit of the readers of the *Gardeners' Chronicle*, but other matters have had the preference. But a question asked last week by one of your correspondents caused me not to delay it any longer. I forget the exact wording of the question, but it was to this effect: "Do bees from bar-framed hives rob the bees that live in skeps, and thus double their own stores?" This reminds me of what cottagers have said to me. They have talked to me something like this: "You say your bees produce more honey than the bees in my skeps, and I know how it is done; they come and rob mine, so you have double and I have none. Ever since your new-fangled hives came up there has been no honey for us poor skepists." Now this is altogether a fallacy. I had occasion to find fault some time ago in the *Gardeners' Chronicle* with Dr. Watts, about the "busy bee," and now I must say something else against this insect, viz., that it is a thorough humbug. Busy it is, but so is an armed burglar. The answer to the whole thing is this, that the strong (bees I mean) for ever rob the weak. Put a strong stock of bees in a skep by the side of a weak stock in a bar-framed hive, and the skep will contain the honey from both hives; while if the conditions are reversed, the honey will be in the bar-framed hive. But inasmuch as the beekeeper who practises the modern system has so many opportunities of strengthening his bees which the skepist has not, the latter must change his tactics, for we cannot alter the nature of these naughty bees. Then, again, we of the modern school are thought to be crafty about the driving business. A little while ago I called on an old lady and found her grieved even to tears. Asking the cause, she said somebody had taken away all her bees. On further inquiry I found she had always brimstoned her bees, but now had allowed somebody to drive them; and although she had all her honey and wax she seemed to think she was better off with brimstoned bees and honey than the opposite. I suppose people will get wiser some day, but I frequently find people who would rather burn their bees than sell them for a trifle to "that there schoolmaster," meaning myself. The autumn altogether has been very favourable for our pets—though humbugs—and they have gone into winter quarters in a very satisfactory state. The weather is mild though wet, therefore if you wish to move your hives do not do so yet, as you might lose them on some fine sunny day. Bees cannot find their hives if moved whilst flying. *Walter Chitty, Peasey.*

NEW HORTICULTURAL PALACE.

YOUR article in the *Gardeners' Chronicle* of last week on the wasted opportunities of the Royal Horticultural Society in not making greater use of the chances now gone by in the several exhibitions we have had exactly echoes my ideas. If we are to hold our own against foreign competition the goods we grow and produce must be brought more prominently before the English public. The sale-rooms of well-known auctioneers are crammed every week with plants from over the "silver streak," most of which could be grown as well in our own country. Where, for instance, can Lilies of the Valley be grown to greater perfection under proper culture than in the fens of Lincolnshire and Cambridgeshire? I have seen and grown in my younger days as fine crowns as any from Berlin, producing magnificent sprays of bloom. It may not be known to many that roots and bulbs grown in our own country force better than foreign ones; no doubt the reason is they are more solid. An English bulb, size for size, is considerably heavier than those from Holland, showing a greater amount of stored-up sap.

It is the same with our Potatoes; the foreign will not bear comparison with our own, not even the Jersey Potato, which seems to store up water instead of starch. I believe nowhere in the world

can finer Gladioli and Tulips be grown than in many parts of England, yet how seldom do we see home-grown bulbs for sale in the sale-rooms. Now at last we are promised a Horticultural Palace. While I write the prospectus is before me, the contents of which, if carried out, I think, must be a vast benefit to our trade. It seems it is intended to make it the great central flower and fruit show of the world, in which they intend to roll India, Canada, New Guinea, Australia, all the other British possessions, as well as Kew and South Kensington, into one show, to be perpetually renewed with fresh supplies, home-grown and Colonial. Surely this will do much for horticulture and the love of flowers, which is rapidly growing amongst us. No doubt education and the annual display of flowers in our parks and open spaces has had a great deal to do with it; but what rather astonished me, when looking at the plans of our new Palace, was to be told that this and that position was already taken or bespoken by Belgian, German, and Flemish firms; actually more spaces being applied for by foreigners than English nurserymen. Where is the enterprise of the Britisher gone? Surely this ought to be chiefly a British and Colonial "possession," where our own wares could be presented to the world without an overwhelming mixture of foreign. The most pleasing sight I have looked on for many a day was the Chrysanthemum Show at the Aquarium last Wednesday, all home-grown. *Edward Collins.*

SUPPLEMENTARY LIST OF PERENNIAL ASTERS.

THE following is a descriptive list of a few Asters, most of which are new to cultivation, and not included in Mr. Baker's monograph of the genus which appeared in these pages a short time ago. So far as is known, it is complete, carrying the Asters up to the present date:—

ASTER PSEUDAMELLUS, *Hook. fl.* (SECTION AMELASTRUM).—Stems numerous, scabrous, 6 to 18 inches high, ascending from woody perennial stocks, simple below, much branched from about the middle, bearing a few corymbose heads; leaves 1-2 inches long, oblong acute or the upper obtuse, entire or toothed, and obscurely nerved on both surfaces; involucre half an inch high and as broad, hardly imbricated; bracts with broad reflexed foliaceous tips, the outermost oblong much larger than the inner; heads from 1-1½ inch in diameter, ligules bluish-purple, 8-16, and from ½-1 inch long, narrow; achenes pubescent, the pappus of few slender hairs rather longer, white or brownish.—Native of the Western Himalayas from 8000-13,000 feet elevation, Afghanistan. It is nearly allied to the European Aster Amellus, but readily distinguished by the much larger outer involucre bracts and invariably toothed leaves. Flowers August, September, and October.

ASTER ANGUSTUS, *Torr. and Gray.* (SECTION 12. CONYZOIDS, PRECEDING MACHERANTHERA.)

Stem 1-2 feet in height, spreading or upright, and branching, with numerous spicately paniced heads; leaves narrow; bracts of the involucre all linear acute, the corolla of the ray flowers generally reduced to the tube, and much shorter than the elongated style; sometimes with a rudimentary ligule.—Flowers August and September, inhabiting saline wet grounds, from Saskatchewan to Utah and Colorado, eastward to Minnesota, and now even extending to Chicago, also North Asiatic. (*Criogaria humilis*, Hook.; *Erigeron ciliatus*, Ledeb.; *Conyza altaica*, DC.; *Triplolium angustum*, Lindl.; *Drachyaetis ciliata*, Ledeb.) A plant more curious than beautiful, and not likely to appeal to florists.

ASTER PEREGRINUS, *Pursh.* (SECTION ERIGERASTRUM.)

Stems from 1-2 feet in height, from a thick creeping rootstock, tomentose or glabrous; lower leaves oblong lanceolate, upper oval lanceolate, closely sessile by a slightly clasping base, 1-2 inches long, entire or sharply denticulate serrate; involucre half an inch high, a little broader; bracts attenuate pubescent or villous; rays half an inch long, violet-purple. (*Aster unalaschensis*, Lees.; *Tilesii*, Wikstr.; *consanguineus*, Ledeb.; *salsuginosus*, Hook.)—Native of North America, flowering August and September. It has been confounded with *Aster salsuginosus*, Richard, now removed to *Erigeron* by Dr. Gray; the latter, however, has a viscidulous glandular, and not villous

involucre, and more numerous ray florets. A fine showy plant, useful for the rock garden.

ASTER STRACHEVI, *Hook. fl.*

Dwarf stoloniferous, with a rambling, often branching rootstock, pubescent or villous, and seldom more than 1-4 inches in height; radical leaves obovate-spathulate, with few or many distinct teeth; scape or stem leaves 1-2 inches long, coarsely and sharply serrate; one or few-flowered; involucre bracts few, scarcely imbricate, all about one length, linear-oblong, acute, or acuminate; ligules thirty to forty, about half an inch long, bluish-purple; achenes pubescent or silky; pappus simple, reddish.—Native of the Western Alpine Himalayas, Kumaon, Pindari, &c., 12,000-13,000 feet elevation; flowering early in summer. A most curious and unique little species, sending out runners or stolons from the original stock like a Strawberry, and capable by this means of being propagated, each runner forming a distinct plant. It appears perfectly hardy, and promises to make a fine rockery subject. *J. G. Baker.*

(To be continued.)

Florets' Flowers.

AURICULAS.

I WROTE last on the Auricula at p. 398, and the subject of the note was repoting, and the "woolly aphid." This pest is very troublesome during hot weather, but it is apparently not so hardy as the green species, which thrives on the leaves, and does ten times more harm to the plants. The greenfly will do harm even in winter, and should be destroyed by fumigating. The outer leaves continue to decay rapidly, and unless promptly removed the existence of valuable specimens may be endangered. The plants may all be kept comparatively dry at the roots now, and ample ventilation is best, the lights being still removed entirely except when it rains or if dense fogs set in. The atmosphere is sometimes so thoroughly saturated with moisture in November and December that it is prudent to keep the lights of all houses closed until the fogs clear off. All repotting should be delayed now until February.

ALPINES IN THE OPEN AIR.

The groups of alpine require to be looked over occasionally for slugs, as these are very troublesome—they do much damage to the tender leaves and other parts of young plants. Soot is the best material to strew on the ground round the plants. It not only kills the slugs or keeps them off, but does the same for worms.

CARNATIONS AND PICOTEES.

Reference was made at p. 398 to putting up the layers and saving the seeds; all this has now been done. The young plants are well established in the frames, so that if a sharp frost sets in the plants will not be injured thereby. Some growers state that the best time to pot up the layers is the end of October. I consider the beginning of the month is a better time. Ours have always been repotted during the last days of September and the early days of October; we finish in the first week of the month. If early frosts set in before the plants are rooted, they are checked in their growth. I never had any plants pot-bound owing to too early potting.

I may say here that the best head of border Carnations is obtained from plants that have been layered in the open ground, and are left to flower where they were layered, merely thinning them out where too much crowded. All plants now in frames should have plenty of air. Any weeds in the pots should be pulled out, decayed leaves removed, and greenfly destroyed. The plants must have a fair supply of water at the roots; allow none of them to become anything like dust dry.

PERPETUAL FLOWERING CARNATIONS.

Those who have taken the greatest care of their plants during the summer and autumn months, will now enjoy the fruits of their labours to their fullest extent. The delicately tinted pale rose and pink forms, the rich scarlet and crimson colours, the chaste white and soft sallow blended together, have a charming effect. The very early propagated plants in 8-inch pots are best for large bushes; smaller ones in 5 and

6-inch pots produce from six to a dozen fine blooms and are very pretty. Two-year-old specimens in 10-inch pots may be grown, and are well grown very handsome. They require a minimum temperature of 50° to 55° in order to develop the flowers to their fullest extent. They are easily kept free from insect pests; as I stated at p. 426, fumigation with tobacco smoke does not injure the most delicate Carnation bloom.

THE CHRYSANTHEMUM.

In the middle of the blooming season it may to some seem out of place to write about propagation for next season, but it is not so. Cuttings may be taken off any time after the middle of November, and be planted in small pots, one in the centre of each pot. Those who are anxious to grow handsome specimen plants for exhibition will find the right way to success by selecting them from amongst the tall stemmed examples that have produced the large single blooms. This must also be done now. Some of them are already producing shoots from the stem near the surface of the ground. Encourage those to grow that are from 2 to 6 inches up the stem; this must be clean cut over above the top shoot, and the plant itself must be shaken out, and re-potted, using good rich soil, and as a rule, the roots may be put into 6 and 7-inch pots. I like the 7-inch very well, as they go well out of these into 9-inch and afterwards into 11-inch, in which they produce their flowers. The best specimen pompon varieties are also produced from cuttings put in now. Root cuttings of course—that is, cuttings which spring up from the ground close to the main stem—when the cuttings are taken off from the stem itself, they have a greater tendency to run to flower prematurely in the month of May; they may be all right, but the chances are equal that they will be all wrong. I would also urge the importance of keeping the plants in steady, healthy growth all through the winter months. *J. Douglas.*

ZONAL PELARGONIUMS.

It seems almost superfluous to attempt to write anything about a class of plants so universally appreciated as zonal Pelargonium—I refer to that section generally grown under glass for decoration and cutting from. Probably no other class of plants rewards the labour bestowed upon them more generously than zonal Pelargoniums; with good cultivation they can easily be made to bloom profusely for three consecutive months, and that, too, in the depth of winter, when their brilliant colours are appreciated most highly. Thanks to the labours of enthusiastic raisers we have now a host of fine varieties greatly in advance of those cultivated ten years ago, especially as regards size of the flowers. One looks in vain amongst the older sorts for the beautifully compact massive and well nigh perfect circular outline of the individual pips that characterise the best varieties. There is also a great improvement in the size of the pips and trusses; many of the latter being like miniature bouquets when well grown. I venture to think they are not so well understood by some gardeners as their merits as winter bloomers deserve. There is one method of cultivating them which might be more generally followed with advantage especially to those who have to provide much cut blooms; it is as follows:—Take a batch of cuttings according to demands and convenience in February, and again in April, potting them up about the fourth week in May, the first batch into 32-size pots, the later batch into 40-size pots, having previously shifted them from the cuttings into 60-size pots. Use a compost consisting of three parts good loam, two parts well-rotted dung (cow-dung, if possible), and one part coarse, clean sand. Have nothing to do with poor, light sandy soil if the best results be desired, and place them on a bed of ashes in a perfectly open, sunny situation. Look them over regularly, and pick off all bloom and the points of the shoots. Continue this treatment, not forgetting to give a liberal supply of water till the end of September, when they should be housed. A house with a temperature of 60°, with an atmosphere rather dry, suits them best. All decaying blooms and leaves should be picked off once a week, as, by doing so, the blooming period is greatly prolonged. It is a good plan to keep a small cask bag of soot, burned earth, or cow-manure in the water-tank during the blooming period. This kind of cultivation will give vigorous, short-jointed bushy plants with abundance of bloom. The April batch must be kept clear of bloom till required to succeed the first batch.

The following varieties will be found to give every satisfaction, and as there are unfortunately many synonyms, it is quite necessary to take the oft-repeated advice, to have no other sorts than those asked for, and to see that you get what you ask for:—Single varieties—Mr. H. Cannell, crimson, white eye, very fine; Lord Chesterfield, magnificent trusses of magenta flowers; Cato, orange-scarlet; Mrs. Gordon, crimson, very distinct white eye; Commander-in-Chief, a grand winter-blooming scarlet. John Gibbons, a strong bedder, is far too good to be left out of a collection of winter bloomers; the same remarks apply to H. Jacoby. Another very good thing is Lord Wolsley; Gathorne Hardy must not be omitted from the list of scarlets; Dr. Denny is a purplish-violet, and very distinct; T. Todman is a grand variety, faultless in shape, very free and fine; Dante, deep magenta, very good and distinct; Edith Little, blush; Evening Star, a lovely gem for 60-size pots. The best salmon-coloured variety is Leviathan, but Lady Chesterfield and Fanny Catlin are both very good, and also of this colour. The best of the pink coloured ones are Mrs. Daniels, Eurydice, and Lady Sheffield; Lucy Bosworth is also worth growing; Queen of the Belgians and Eureka are among the best whites.

Amongst double varieties the following are worthy of a place:—F. V. Raspaill, Mr. H. Cannell, scarlets; Jules Simon, Rosa Bonheur, rose-coloured; the Lord Mayor, pink, very fine and good; light orange, Earl König; Lacena, purplish coloured, flowers very good; and the double Indian Yellow. Whites:—Le Cygne, and Madame Lemoine. All these varieties should be in every collection. *F. W. Sears.*

HINTS ON HOLLYHOCKS.

It is a fortunate circumstance that seedling Hollyhocks do not greatly vary from the form and colour of the parent flowers. It follows that, when the seed is obtained from plants carefully selected for their fine qualities, a good bloom may be expected by adopting the simplest and the cheapest method of cultivation. The seeds may be sown at any time from March to August; but early sowing is advisable, as the plants can be put out in time to make a free growth the first season, to prepare them for a strong bloom in the season following. As a considerable number of the finest named sorts, that were things of renown fifty years ago, are still in cultivation, the propagation by divisions and cuttings is still a matter of some importance. The time for this business is in the decline of the summer, or early in the autumn. It is an easy matter to detach from the base a short shoot or portion of the stool, and this being potted, and kept through the winter in a frame, will grow freely in the spring, and should be planted out as soon as the weather permits in April or May—the earlier the better, provided there is no particular danger of injury from frost. In places much exposed the planting must be later than in warm, sheltered situations. The requisites for the production of fine blooms of Hollyhocks are a deep, rich, moist soil; perfect drainage, to prevent injury by winter damp; and full exposure to air and light. In places much overshadowed by trees, or where much hemmed in by walls and fences, Hollyhocks do not prosper. They love sunshine and fresh air; they love good living, and in a hot, dry season may with great advantage be liberally supplied with water. *From "Familiar Garden Flowers" for November.*

FRUIT TREE PLANTATIONS, AND ARTIFICIAL MANURE.

APPLES on the Paradise stock will be a more profitable crop for the farmer of the future than standard trees. The orchard of dwarf trees can be planted, cultivated, and brought into profit while the standard orchard is struggling into growth. It is much less troublesome to surround a dwarf orchard with wire fencing than to protect every individual standard. I have found that rabbits are effectually prevented from burrowing under the fence by sinking a strand of barbed wire about 4 inches deep. The trees should be planted 9 feet apart row from row, and 4 to 6 feet in the rows, forming continuous hedges. The proper sorts to be cultivated are named in the catalogue. Owing to the extraordinary importations of Apples from America in the autumn, the planter should select early sorts which can be sold in July, August, September, and October. The soil should be surface-dressed with artificial manure if stable manure cannot

be easily obtained, as after a heavy crop the trees will require assistance.

In small gardens much trouble may be saved by the application of chemical manures to fruit trees. Bones, sulphate of ammonia, nitrate of soda, soot, superphosphate, sulphate of iron, fish manure, will replace stable manure, often difficult to obtain of good quality, and not so easy of application. An analysis of the soil would be of great use to the planter on a large scale, and would probably save valuable time.

The cultivation of Grapes with artificial manure will probably be more extended in the future than at present; but as different soils require different manures, it is necessary to discover the proper composition. White and black Grapes require studying as to the nature of the manures to be used. When this question is thoroughly understood less will be heard of shanking or failing to colour. Grapes may be successfully grown in perforated pots, the roots being allowed to penetrate into the soil surrounding the pot, which must be renewed every year, the roots being then cut off close to the perforations. The soil, supported by bricks, should extend about 2 feet from the pot, which is plunged up to the rim, and may be placed over hot-water pipes. This will be found a cheap method of making a Vine border. *T. F. Rivers, in List of Fruits for 1886.*

HOME CORRESPONDENCE.

Notes on Seedling Conifers.—I have just noticed a strange fact, that in the old genus *Picea* (now called *Abies*), *P. grandis* is the only member whose mode of growth in a seedling state is similar to that of the young plants of the *Abies* tribe, viz., that instead of the usual whorl of leaves produced in the *Picea* tribe (note *P. cephalonica*, *P. Pissapo*, *P. Nordmanniana*), *P. grandis* has an elongated stem, with the leaves placed, not in a whorl at the top, but regularly along it, similar to *Abies Douglasii*, *A. Menziesii*, or *A. excelsa* of equal ages. Seedling plants of *Abies grandis*, from seeds sown last season, are now 2½ inches in height; *A. Nordmanniana*, 1½ inch; *A. cephalonica*, 1½ inch; *A. Pissapo*, 1½ inch; while the *Douglas Fir* is 2 inches; *A. Menziesii*, 7 inch; *A. excelsa*, 1½ inch; and *Pinus sylvestris* and *P. Laricio* 2 inches and 2½ inches respectively. The latter *Pine* is remarkably bushy for its height, and grows with unusual rapidity, two-year seedlings being 6 inches high, and with leaves 4 inches long. The peculiar twisted foliage is very noticeable in the plants under consideration, the seeds having been carefully collected from the typical *P. Laricio*, which is readily detected by the peculiar twist near the base of each leaf. This form, I might add in passing, is the most valuable tree for commercial purposes. *Abies* or *Pseudo-Tsuga Douglasii* of two years old is fully 12 inches high; this tree grows rapidly even in the younger stages of its existence. How pigmy in size the twelvemonth old plants of *Menzies' Spruce* appear! these being only three-quarters of an inch in height, but remarkably bushy, if we may so speak, at the top. The *Cluster Pine* is 2 inches high at a year old, stiff and strong. These are the average heights of seedlings sown the same day and in the same seed-bed. How different in appearance they are! the foliage of some being of a light silvery-green, while that of others is of such a deep green as almost to approach black. *A. D. Webster.*

Ivy-leaved Pelargoniums.—As a supplement to my remarks on the above subject, I regard those of Mr. W. J. Ireland as a valuable addition, not affecting what I wrote, as I did not touch upon growing plants for supplying cut flowers alone. I wished to call attention to their great value for decorative purposes when grown in pots from 4 to 6 inches in diameter, for arranging among other plants for house or conservatory embellishment, or when shifted into larger pots, and trained to pyramidal trellises, they make nice specimens for placing in prominent positions. In regard to your correspondent's statement, that when trained in the way above indicated the shoots do not get sufficient light to enable them to flower satisfac-

torily during the winter months, I will mention that our own plants are at the present time completely studded with flowers and opening buds, which daily find many admirers. Where plants are grown for supplying cut flowers alone, Mr. H. Daniels' method is, without doubt, an excellent one, and he has done good service in calling attention to his practice, but as in the majority of gardens plants are wanted for using in the way I have described, it becomes necessary to grow them in smaller pots also, and train in the way most suited to the purpose for which they are required. *H. Dunkin.*

Mild Weather in Scotland.—Thursday, November 11, which in Scotland is called the gardeners' term. Being an ardent Dahlias grower I have been anxious for the last thirty years to show Dahlias blooms on the term day, but was always disappointed on account of the frost, till this season, when on that day I showed a very nice stand of blooms in my warehouse, many of which would not have disgraced an exhibition stand; and what pleased me most was to see the interest the young gardeners took in them. *John Davison*

Raising Potatoes and Peas.—I have no doubt whatever that your correspondent, Mr. Diver, in some recent observations on this topic, is not alone in holding the belief that Potato and Pea raising is a very profitable occupation. If I were to aver that the profit, if any is to be found, is rarely the raiser's, he would perhaps smile sceptically; but if I invite him to try for himself and see how much wealth he can extract from the raising of new kinds of these vegetables, he will probably shrug his shoulders and respectfully decline. It may be that gardeners who have their employers' gardens and labour to operate in can carry out much of the kind referred to profitably. I do not know, but I doubt very much whether, even then they find the game worth the candle, and in the case of those who have to pay rent for ground and find a livelihood from out of their own labours, I am certain that profit is all moonshine. Perhaps I might be asked, Why, then, do those who raise new kinds of these vegetables continue to do so? My answer is that they are under the influence of deep interest in what they have set about, an interest which is more potent than even the pursuit of wealth, for it possesses attractions which are to the true raiser irresistible. Those who raise seedling Potatoes or Peas find their interest increased with the extent of their operations; and it is well it should be so, for out of perhaps fifty or one hundred seedlings—each one of which saved needs a more or less space each year—it will be found that a score or more of sown the best will have to be cast aside each year, until the total number is weeded down to some half dozen, or even less. My advice to those who envy raisers their profits (?) is to turn-to and reap some of those profits for themselves. *A. D.*

Abnormal Cypripedium Spicerianum.—In the normal condition of the flower of an Orchid it is so complicated by cohesion, adhesion, suppression, and other modifications, that the morphology of parts as they occur in these vegetables generally is with difficulty recognisable. Notwithstanding the fact that there is less suppression in Cypripedium and its allies than in the other tribes, it is still a very complicated flower. In most species of Cypripedium the lateral sepals are connate into one piece, apparently for the support of the large pouch-shaped labellum, leaving no trace of their plurality of origin except two mid-ribs and generally two small apical teeth. *C.* Spicerianum is an exception to this, and has its lateral sepals almost free, almost to the base. An specimen of *C.* Spicerianum given me lately has the lateral sepals divided to the very base and enlarged on the contiguous sides and revolute there, giving them the same oblique appearance as occurs in *Phalenopsis amabilis*, *P. Aphrodite*, and *P. Schilleriana*. This extra development is pure white, like the greater part of the upper sepal, while the rest is green, as in the normal state of the flower. All the three anthers of the inner whorl of stamens are developed instead of two, and appear perfect in every respect. The third and unusual one, occurs immediately in front of, and below the stigma, which is bifid on that side, to accommodate the filament of the anther (an unusual phenomenon). The rest of the flower is normal excepting the labellum, which shows a tendency to lose its pouched condition, is rather deeply bifid in front, and has a green band extending along its middle throughout its length internally, with a purple band on each side of this, while the rest is spotted purple. The significance of the green and purple bands together with the fission of the labellum is not very evident. *J. F.*

Eucharis amazonica Planted Out.—I advocated the above system in these columns last January, after a fair trial of nine years, during the whole of which time I had been most successful in growing this most useful of stove flowering plants for cutting pur-

poses. I thought, perhaps, it might be of some interest to a few of the numerous readers of the *Gardeners' Chronicle* to hear what these have been doing since I sent my first few notes on the above subject. These have been in bloom twice since January, this last time for the past seven or eight weeks, and there are still some flowers ready to open. I have great pleasure in submitting specimens to the Editor, to show what large leathery foliage they make, and strong spikes of bloom they carry. I have gathered some hundreds of blooms from these plants growing in the 76 feet of bordering in the plant stove here, and many who have seen them lately can bear out my statement; some of the spikes have measured as much as 36 inches long. I have watched these very closely, and still have no hesitation in saying that the same bulbs have already bloomed thrice within the year. After this time of blooming I do not expect to have them in bloom again till next January. I have seen spaces in many plant stoves that could well be utilised for this purpose, either as borders or rockwork; the *Eucharis* will do equally well in one as the other. Distance from the glass is no object; some of these are 12 feet from the glass, and others 6 feet, and the compost for planting them in I would recommend a loam soil (when it can be got good), with some coarse silver-sand added. I have a good stock of pot plants, and with these and the planted-out ones I am scarcely ever without *Eucharis* flowers throughout the year, and where hard forcing would have to be resorted to for supply, no better bulbs could be procured for putting-up than those grown under the above system. I have lately extended this system by planting the back border 40 feet long, a house of planted-out *Camellias* I should state the hot-water pipes run along by the side of this border. They were very small bulbs when put out, and have only been planted twelve months; they have grown well, and if they only bloom once in a year they will repay the little trouble they have been. I have also put some out in a short length of border in a greenhouse, which I hope also to be successful with; the same border and return pipe heating one range of houses is by the side of this house. There is also an old plant of *Stephanotis floribunda* growing in this border, part of the roof of the house being covered with it, and which produces hundreds of blooms through the summer months; this plant is never troubled with mealy-bug or scale, as would be the case were it growing in stove temperature. The system of planting-out *Eucharis* is becoming more general, and to those who have only lately adopted this system I can assure them (after ten years' experience) that they will meet with the greatest success; and they will also find that the growth they make is far stronger than those cultivated in pots, and also a far greater yield of flowers for cutting purposes. *Edward Ward, Hessel Gardens, Bromsgrove.* [The bulbs, foliage, and flowers, sent with this communication, were of extraordinary vigour. Ed.]

Bradford School of Science and Art.—I wish to inform you that I am laying out the grounds for the school, and that Mr. F. S. Holmes has nothing to do with the work at all, it having been done by public tender. Having read the paragraph about the school in the *Gardeners' Chronicle* for October 30, I shall esteem it a great favour if you would kindly correct it. *Wm. Green.* [We regret having been misled, but the information we published, being taken from an official document, we were under the impression that it was correct. Ed.]

Narcissus viridiflorus in North Africa.—Three years ago we extended through the pages of the *Gardeners' Chronicle* the rediscovery of the long-lost *Narcissus viridiflorus* in the neighbourhood of Gibraltar, and yesterday I had the pleasure of confirming its reputed occurrence on the African side of the Straits of Gibraltar, and found it in fair abundance about 6 miles from Tangier intermixed with *Narcissus serotinus*. I also found several hybrids between *N. viridiflorus* and *N. serotinus*. The individual varies very much, the leaning in character towards one parent and some towards the other, one example being as nearly as possible intermediate in character between the two species. *George Mason, F.L.S.*

Chrysanthemum at Workop Manor, Notts.—When visiting the above gardens in company with a gardening friend the other day we were shown one of the finest collections of Chrysanthemum in bloom I may safely say in North Notts. About 150 varieties are grown of the most approved sorts, with several duplicates of proved varieties, as specimen or large blooms are the first consideration with Mr. Sutton (gr. to J. J. Cookson, Esq.), who most certainly he congratulated on his achievements in the culture of this plant. The best description I can give your readers of them is that they resemble large show Dahlias, and there are hundreds of them. The plants range from 18 inches to 7 feet high, fine healthy plants, and are arranged in one of the large vinerias.

Should any of our brothers of the craft be in the neighbourhood of Workop, they, like me, would not regret spending an hour inspecting this collection of Chrysanthemum. *J. Jefferson, Workop.*

Convolvulus mauritanicus.—The Mauritainian, or North African Convolvulus, by many taken for a Campanula, being amongst the freest flowering of what are known as hardy greenhouse plants, rarely receives a little the culture attending it so well deserves. Rarely is it met with amidst collections of plants, though frequently it enlivens by its beautiful light blue flowers (so abundantly produced) the window of the cottage. Blooming during the summer months, when show pot-grown plants are scarce, it seems to have double claims upon growers. The plant strikes very readily, and may be propagated by division, occupying very little attention or space during the winter; it makes a rapid growth in each spring, developing into a rare mass of bloom; and where grown it rarely has its growing capabilities passed beyond what 48-sized pots are capable of producing; whereas if 24 or 16-sized pots were filled with it the result would prove a gorgeous display, quite unique in the matter of colour, habit, and floral wealth. *Convolvulus mauritanicus* succeeds well planted out-of-doors during the summer months, protected up to wintered with ordinary cool greenhouse plants. *William Earley.*

Sonerilas.—Are the pretty silvery-leaved *Sonerilas* to be relegated to the category of neglected plants? There is danger of this, late being in store for them, and, as Mr. B. S. Williams observes in his book on *Chive Stove and Greenhouse Ornamental-leaved Plants*, they "are exceedingly attractive objects when laden with their bright-coloured although small flowers; but they are remarkable for the beauty of their leaves, heightened by their charming blossoms."

That Mr. Williams regards them as plants to be grown more for their silvery leaves than for their flowers—pretty as they are—is proved from the fact that he has classed the *Sonerilas* among the stove ornamental-leaved rather than among the flowering plants. It was about 1854 that Mr. Thomas Lobbs sent home to Messrs. Veitch & Sons from India the pearl-bearing *Soneria margaritacea*; it was shown by them at the November meeting of the Royal Horticultural Society in that year, and it was greatly admired for its low growth and free branching habit, forming dense tufts of foliage, bearing numerous flowers, stems of bright rose-colored flowers. From this, either by fertilisation with an older species or simply as seedlings, have sprung a group of several forms, and these I saw in capital condition at Mr. B. S. Williams' nursery at Holloway a few weeks ago—small, but charming plants, with their leaf character beautifully developed, varying both in the size of the leaf and character of the leaf marking. They were growing out freely in a stove-house, and appeared to be luxuriating in the warmth of the atmosphere surrounding them. I am unable to give the order in which the different varieties appeared in point of time, but the leading forms at Holloway are as follows, viz.:—*margaritacea* with medium sized leaves of a dark olive colour, marked with greyish-white oval spots, the reverse of the leaves rosy, with rosy veins; *Hendersoni argentea*, smooth clear silver leaves, with rosy midrib, and very slight dark green veins; *Hendersoni marmorata*, large leaved, silvery, having veins of reddish dark green; *Hendersoni metallica*, large leaved, olive-green ground, the veins having side spots and blotches of grey, the midrib slightly rose; *Madame Legrelle*, small leaved, shining pale grey in colour, with slight rosy-green veins; *Rita*, the olive-green leaves much spotted with small dots of grey especially towards the point, medium sized veins including small; and *Andra*, the small grey leaves with bright olive-green towards the point; the veins slightly rosy. Looking upon the group as they were growing together there appeared to be great diversity of character in size and marking, though silvery-grey predominated in all, excepting *margaritacea*. A class for six specimens of *Sonerilas* always finds a place in the schedule of prizes offered at the great Whitson show at Manchester, large and well grown specimens being produced. Occasionally they are shown in flower, when the Whitson season falls later than usual; but when not in bloom the tufts of foliage are very attractive. The leading exhibitor is Mr. A. Cole, gr. to Joseph Broome, Esq., Woodlawn, Midsbury, Manchester. There appears to be some difficulty in growing specimens on for two or three years, and so Mr. Cole finds it best to strike fresh plants every year. The difficulty appears to be in keeping the plants through the winter after they have done flowering. Mr. Cole states that their natural time for blooming appears to be in November, and as Mr. Broome likes best to have them in flower at that season of the year, he finds it the best plan to throw away the old plants and start afresh with new ones. Therefore he propagates every year by means of cuttings several of each form that he grows, and

pushes them on freely in a propagating frame in a brisk heat, keeping the foliage quite dry, taking off the lights each morning to dry up any damp that may have accumulated and settled upon the foliage during the night. By keeping these young plants continually growing and not allowing them to flower, they grow very freely, and make much finer foliage and better marked than by growing them without the use of the frame. The plants are kept in this frame until about three weeks before the Whit-sunday show, when they are exposed so as to bear the temperature of the large exhibition-house in the Botanical Gardens. Mr. Cole states that he does not confine himself to any particular soil, but generally uses a mixture of light fibrous loam, peat, leaf-mould, and a good sprinkling of coarse sand, keeping the plants rather dry at the roots. *K. D.*

Senecio macroglossus.—Two or three years ago a correspondent sent me cuttings of an elegant plant, the leaves and habit of which greatly resembled some varieties of *Ficaria*, but without the use of the roots, or of its woodiness. Though the leaves were less divided the resemblance to such forms of *Ivy* was very remarkable even as regards thickness, colour, and the white veins the above forms are known to possess. I grew and bloomed this plant, and find it to be identical with what the Americans name *Senecio macroglossus*, the flowers, which form upon young terminal shoots being similar in shape to the single-flowered *Jessamine*, and of twice or four times the size of pale yellow and also white colour. I do not find the plant catalogued by trade growers, though it seems a very desirable plant. I observe it occasionally called "German Ivy," though certainly not identical with the latter, a plant of which I also possess. *H. E.*

Dimorphism in Leaves.—Dimorphism is by no means of un-common occurrence especially in some orders, but when it becomes of everyday occurrence we are apt to overlook the fact or altogether disregard it. Cut of lobed leaves, as mentioned in the *Gardeners' Chronicle*, p. 471 of the present volume, in the case of *Morus nigra*, an exceptional, but has been recorded by London. Such has not come under my observation but in *M. alba* and some of its varieties there is a constant and well marked dimorphism at all times whether the tree has been subjected to severe pruning or not. In divided leaves the three-lobed is the commonest form, in accordance with the three strong basal nerves. *M. alba* has small undivided leaves, and the same applies to *M. a. var. pumila* with large leaves; while the large-leaved form, *M. a. Moretiana* occasionally exhibits more or less lobed leaves. On the other hand a variety known as *M. a. japonica* has large, habitually much divided leaves, exhibiting heart-shaped undivided ones only on the small lateral branches. Singularly enough in the specimen I have seen of *M. tatarica*, division only appears occasionally towards the tips of the exhausted branches, and on slender axillary ones where the leaves are also considerably below the average size. This is contrary to the usual rule, where the larger leaves are the most divided, and *Urtica dioica* refers belong to the same natural group as *Morus*, and produces not only its peculiar and characteristically lobed leaves, but occasionally heart-shaped, undivided, and other intermediate forms, and all these, it may be, on the same branch. The Jack-fruit tree, *Artocarpus integrifolia*, claiming affinity with the above, varies with entire or lobed leaves, and so does *Dorstenia contrayerva*, more rarely *Ficus Carica*. A more common, occurs sometimes on vigorous or rampant-growing shoots of *Ulmus campestris*. This also belongs to the great natural family *Urticaceae*, bearing its familiar unequal-sided leaves. A small leaflet sometimes appears on the part where the blade is normally cut away, springing from the midrib, more or less distinctly stalked, and practically constituting the leaf a compound one, with a large and a small leaflet. Dimorphism is also of frequent occurrence in the Olive family. The simple-leaved form of *Fraxinus excelsior*, grown under various names, produces simple, and occasionally tri- and quinque-lobed leaves. *F. rufa* may be cited as an instance of polymorphism, or heteromorphism. The leaves are mostly simple, and merely serrated, or variously incised. Occasionally a pair of leaves occurs with three leaflets, while of another pair one may be small and simple, while its companion leaf has many times the size, and consisting of three leaflets. Several species of *Jasminum* exhibit dimorphism, and *Forsythia suspensa* very frequently produces simple and compound leaves of three leaflets on the same twig. Dimorphism in the leaves of many of the *Leguminosae* is well known, but probably frequently overlooked on account of its frequency. The *Gleditsias*, spoken of at p. 404 of the present volume, might be instanced as a case of heteromorphism. Various forms of leaves also present themselves in *Acacia*, *Lathyrus*, *Oleis*, and other genera. On vigorous growing and barren shoots of *Mespilus Smithii* the leaves are deeply

incised, sometimes almost trifoliate, while those on the flowering shoots are narrower, and merely shallowly serrated. The variability of the leaves is more inexplicable and unexpected when it appears in such genera of the *Caprifoliaceae* as *Symphoricarpos* and *Lonicera*, where the leaves are not only undivided as a rule, but have very entire margins. On vigorous radical shoots of *S. racemosus* the leaves are often so deeply serrated that some botanists have mistaken the plant for a different species. The normally entire leaves of *Lonicera periclymenum*, *L. japonica*, and *L. brachypoda* are sometimes placed, especially in the latter, by sinuated ones resembling those of an Oak. Furthermore, in a batch of young plants of *Collisia bicolor* frequent instances occur of deeply three-lobed leaves—a remarkable deviation from the normally undivided form. *J. E.*

Humea elegans.—To succeed well, this peculiar form of the natural order *Compositae*, named after Lady Hume, and introduced by her from New South Wales, requires more than slip-bud culture. It is a biennial plant in the strict sense, and only requires attention for about eighteen months, or between the time the first seedlings show and flower-spikes are forming, can examples worthily representing the singular beauty of this solitary species be produced. This plant, with some others introduced from the same locality, requires very similar treatment to what New Holland plants receive, a treatment consisting of uniformity as regards temperate warmth, and care in supplying a moderate amount of moisture to the roots. Any extreme either way will tell against the stature and beauty of the future specimens, and if it does not disfigure them by loss of leaves, and from a peculiar disease, akin to what has been described as "spot" in connection with other forms of vegetation. With these reservations the culture of these plants may, nevertheless, be described as very simple. Seeds should be sown in pans or pots, and rich fibrous loam, with a liberal supply of silver-sand, and placed into a heat of not less than 65° about the first week in the month of May. So soon as the young seedling plants are large enough transplant them singly into 60's and similar soil. When root growth is renewed keep upon an airy shelf in full sunshine, giving water very regularly. Give another small shift as necessary, at all times potting somewhat firmly. Place the young plants out-of-doors after the middle of June upon a properly prepared einder-ash bottom, and on the most favourable site that can be found as regards freedom from sun-burn. Waterings must be given very regularly as needed. Any neglect in this regard, especially if the plants suffer from the want of water, will cause them to shed some of their lower leaves when housed again in the late autumn, and fine heads of bloom will not be possible. At the approach of cold weather re-house the plants, placing them in an airy light position, as such as will suit an *Eperis*. Water as necessary through the winter, and give a final shift into the blooming pots during the month of April following. The size of pot to be then used must depend on the size of plants and their healthful appearance, in the matter of retention of all their leaves, &c. Fine healthy leaves are an unfailing proof of the vigour of these peculiar plants and their capacity to make even better progress between then and the full blooming period. *H. E.*

Leeks.—I think that the taste for Leeks must be growing in this part of the United Kingdom, and that the people of England are beginning to appreciate it as much as the Scotchmen and Welshmen. That it is a good, fine-flavoured, wholesome vegetable there can be no doubt. It is said that "one reason of its fame in Scotland and the colder parts of Wales is its exceeding hardiness, for the severest winters do not harm the plant, and it may remain in the open ground until wanted, occasioning no trouble for storage." One mark of the growth of the Leek in popularity is shown in the fact that the London market gardeners are found growing it much more abundantly during the past few years than they formerly did. Last year, owing to the severe drought of the summer, the Leek crop was an almost entire failure; the growers still followed the old plan of growing their seeds in a bed, and then transplanting them to the open ground. Just as this had been done in 1885 a long spell of hot, dry weather followed, the plants made but little growth, and the crop was scarcely worth the trouble of marketing. Garden Leeks are put out during what the market gardeners call a "dripping time," they are very slow in getting into growth, for it is a succulent and moisture-loving plant. During the past year—probably in consequence of having profited by the experience of the previous one—one of the largest market growers of Leeks in my neighbourhood adopted the practice of sowing the seed in the open ground in drills, as in the case of Onions, things out in rows, and putting them as the plants were large enough, and roots them out in a plantation near at hand. What a change from last season is witnessed

this? Now there are plenty of Leeks; and such Leeks too! I saw a labourer digging them up the other day—very large, thick, fleshy plants, that are gathered up by women, trimmed and washed, and sent to market. The one sowing in the open has produced successive crops—first the plants that have remained undisturbed in the soil; secondly, the thinnings of the lines that were transplanted. The ground in which they had been growing is somewhat light and stony, but heavily manured, and a very valuable crop has resulted. I suppose there is a kind of prejudice against Leeks, for they are not often seen in private gardens in anything like quantity, and yet when properly cooked and served up with appropriate gravy they make a delicious dish. It is recommended, in order to grow fine roots or Leeks, that, when the ground is strong and fertile, they be planted out quite far apart; that, in planning the leaves should be shortened a little—only a little, then the dibber should be driven down deep enough to bury the plant to the base of the leaves, pressing the soil gently about the root. Liberal waterings are necessary as required; the ground should be occasionally stirred between the plants, and the tops of the leaves again shortened. Treated in this way very fine Leeks are produced. *D.*

Reports of Societies.

STOKE NEWINGTON AND HIGHBURY: November 4 and 5.

POT PLANTS.—This show was held in the hall of the Highbury Athenaeum on the above dates. It suffered somewhat because of its incapacity to fill the large area satisfactorily. Generally the exhibits were good—in some cases specially so; specimen plants being generally excellent, whilst the nine semi-pyramidal trained plants from Mr. Monk were far better than are usually seen. One of the most interesting features of the show was a collection of cut flowers, comprising incurved, Japanese, and pom-pom *Chrysanthemums*, chiefly from the open ground, and bouquet, *Cactus*, and single *Dolichos* from Mr. T. S. Ware, Tottenham. It is, indeed, a rare circumstance thus to see *Dahlia* blooms shown in such quantity and beauty on November 4, and well illustrated the mildness of the autumn. All the best single and *Cactus* forms were well represented, while the bouquet kinds seemed as good as at any time. The *Chrysanthemums* included many first-rate sorts.

Mr. Cochrane sent from Finsbury Park a couple of flat trained *Chrysanthemum* plants, somewhat cock-hat in shape, about 4 feet across at the base and 3 feet high—one Mrs. Dixon and the other G. Glenny—with some blooms of Mrs. G. Randle showing at the top in each case; these are screen or fireplace plants, and very effective. Mr. Cochrane also sent some good cut blooms.

Mr. J. M. Chard, of Stoke Newington, dressed the large platform with large Palms and groups of *Chrysanthemums*.

Only two groups of *Chrysanthemums* competed—the best, from Mr. Willey, Highgate Cemetery, was a first-rate lot of plants, finely bloomed, and not crowded; they ranged from 8 feet high behind down to 2 feet in front, with a run of 10 feet slope, and the dwarf plants carrying very fine single blooms of *Eline*, *Mad. Leroix*, and others were just what should be seen in the facing of all similar groups. Mr. Osborne, gr. to A. Larkin, Esq., Highbury, had the other group.

In the class for nine trained plants the lot from Mr. Monk, gr. to W. Fowler, Esq., Leytonstone, was exceptionally good, the exhibits consisting of semi-pyramids ranging from 3 to 4 feet in height, proportionally broad and grandly flowered. Dr. Sharpe had some 150 blooms, all good; Prince of Wales, Mrs. G. Randle, G. Glenny, Lady Hardinge, and Chevalier Domage of solid flowered kinds; and *Eline*, *Madame de Sevin*, and *Cosack*, Japanese. Mr. Bass, gr. to Miss Cotton, Leytonstone, came 2d; and Mr. Davey, gr. to C. P. Caine, Esq., Sandford Hill, was 3d. Both these lots were of the same style of growth and well bloomed, but lacked the fine quality found in the 1st lot.

The best four trained plants came from Mr. Gilbey, gr. to B. Booth, Esq., Clapton.

Standard plants were also excellent, some exceptionally so, the heads being masses of bloom. Mr. Gilbey was 1st.

Standard pompons were good, also such kinds as Mrs. Bayley, Marie Stuart, Sunset, Souci Melaine, and Fanny being finely bloomed. Mr. Gilbey was again 1st here.

Classes for foliated plants, Ferns, and table plants brought fair competition, especially in the latter class. Mr. Challis, gr. to H. Dore, Esq., Park Lane, had the best foliage plants, chiefly Palms; and the best Ferns, whilst Mr. Gilbey took 1st place with neat

medium-sized table plants, Mr. Chard coming next with others almost as excellent.

CUT BLOOMS.

The chief class was that for thirty-six incurved flowers, only two lots competing, the best coming from Mr. Bittsworth, gr. to R. Ewing, Esq., Chesnut; the flowers were of average quality, some being fair and others moderately so.

There was no competition in the class for twenty-four blooms, and but three lots of twelve blooms, the best flowers here being Prince Imperial, Prince Alfred, Prince of Wales, R. Ingleby, Mrs. Heale, Abbé Passaglia, Nil Desperandum, Jeanne d'Arc, Lord Wolsley, and Golden Empress. Mr. Monk was 1st.

Messrs. Davey, Osborne, and Saunders, took the prizes in the class for six blooms.

Some very good Anemone-flowered kinds came from Mr. Osborne, including several of the Japanese forms with their long flowers.

Pompons in bunches were rather small. On the other hand Japanese flowers were good.

In the class for twenty-four blooms one stand had the flowers elevated on tubes quite 6 inches above the stand; this gave to the other flowers a disadvantageous appearance. Certainly schedules should insist upon some uniformity in relation to height of flowers, as well as to dimensions of stands.

In the class for twelve blooms the competition was larger. Mr. Smith coming 1st. The best flowers here were very meritorious.

One of the best lots of blooms in the show was a dozen of incurved shown in an amateur's class by Mr. Bingham, Stoke Newington. They were clean, solid, and capably finished.

The best stand for dinner-table, of Chrysanthemum blooms, a very telling arrangement, came from Mr. Clarke, gr. to W. Broad, Esq., Wanstead Park. Mr. Clarke also was 1st in the bouquet class with one of pure white blooms; Mr. Chard being 2d, with a much larger arrangement.

The vases holding twelve blooms on long stems were good, Japanese blooms filling the 1st prize one—from Mr. Jones; and Mr. Clarke came close with the 2d vase.

NORTH OF SCOTLAND ROOT ASSOCIATION.

THE annual exhibition of this Association was held on Saturday, the 6th inst., at Inverurie, near Aberdeen. From various causes the total entries were not so large as they have been in the last few years, but the quality all over was remarkably good. The entries numbered 774, as compared with 854 last year, a falling off of eighty. The deficiency was partly accounted for by a new rule introduced into the Association, which restricts members to two entries in each class.

It would appear, too, that the Tarloir crop is not proving to be the success that was at one time predicted, and that Swedish Turnips, have not bulked well. The display of Swedish Turnips was, therefore, not so good as in some former years, and not a few of those who intended to compete failed to put in an appearance, the result of their examination of the crop being probably unsatisfactory.

The season has been reckoned a good one for Potatoes, and there appears to be very little signs of disease. Exhibitors at this show have paid so much attention to the cultivation of Potatoes, and their success has been so great, that they do not expect to be able to make very great improvements on the different varieties now. At any rate the exhibition of Saturday was said to be in respect of the quality, though the entries were slightly back, as fine as any of the previous shows. Field-grown Potatoes were exceedingly fine, particularly the kidney varieties, Grampians, and the collections in the department for garden Potatoes. Anything nearer perfection than Mr. Moir's plants of the Snowdrop variety could not be looked for. It is said that among the exhibitors who patronise the Association's show the favourite Potatoes, after the test of several years' experiments, are Yorkshire Hero, Bountiful, Dalmahoy, and Glenbervie; while for field produce the Grampians can hardly be beaten amongst coloured varieties. It is about eleven years since it was first introduced here, and it has proved an excellent Potato for good use. The Champion Potato takes a leading place in Potato-growing districts, and in a season when disease is prevalent it is nearly indispensable. There was a fine display of these and also of Donaldson's Victoria alba, which since it made its appearance has taken a pretty strong hold in Aberdeenshire. Mr. Greig, Lochgarth, exhibited several lots of seedlings, in which the judges awarded 1st prizes in their respective classes. Vegetables were well shown. The display of fruit was meagre, the entries being only about one-half when compared with last year. The cold weather which prevailed during May and June spoiled the crop, and taking this into account the quality was very good.

The splendid collections sent forward for exhibition

by Messrs. Ben. Reid & Co., and Messrs. W. Smith & Son, Aberdeen, were a source of great attraction to the many visitors present. They excelled any of the kind ever seen at the Association shows, occupying one whole side of the hall. The first-named firm exhibited a large and splendid collection of Potatoes, including all the old well known sorts along with those of recent introduction. Splendid examples of the following sorts were shown:—Clarke's White Forty-fold—said to be one of the heaviest croppers yet introduced, the firm having lifted 15 tons per acre as the produce from the above variety; Ingleston Fluke, Cromwell, Rosebery, Glaston, Keith Hall, Village Blacksmith, &c.; Fyvie Flower, a new kidney variety raised by Mr. Farquhar, to be sent out in spring by Messrs. Ben. Reid & Co. for the first time, was shown in fine condition, and is likely to prove a great acquisition. This variety obtained the First-class Certificate at Chiswick out of 100 varieties tried against it. A fine lot of vegetables were also exhibited.

Messrs. W. Smith & Son exhibited a fine collection of Potatoes, over 100 varieties, all correctly named, including several not yet in commerce, viz., Bon Accord, Sims' Improved Glenbervie, Turnerhall Seedling, California or Gold-leafed, &c.; they also showed an excellent lot of Sutton's Prize Green-top Yellow Turnips, originally sent out by this firm.

The weather during the day was cold and showery, but there was a large attendance of visitors. H. A.

SOUTHAMPTON CHRYSANTHEMUM: November 9 and 10.

AS usual, the Victoria Skating Rink was the scene of the annual exhibition, of which Chrysanthemums form the chief part. An excellent exhibition it was, comprising a great variety of gardening productions. Trained plants of Chrysanthemums were very fine indeed, the groups of the plants were good, and cut blooms were staged in large numbers; in the winning stands the quality was first rate, when we consider that the weather has not been of the best for the best for the development and safe keeping of the expanded blooms, owing to the number of wet days recently experienced. Fine shows in capital exhibition were, as they always are, of the highest merit. At shows of this Society we always expect to see the same excellent arrangements, the committee, with Captain Gibbs as chairman, and Mr. Fudge as secretary, having regulated everything so well that the meeting passed off without hitch of any kind.

PLANTS IN POTS.

For the best collection of Chrysanthemums arranged in a space 8 feet by 5 feet Mr. Allen, gr. to J. Bailey, Esq., Elmfield Hill, Southampton, was 1st; his plants were dwarf, with good flowers of both Japanese and incurved varieties.

For the best six plants, incurved or reflexed, Mr. W. Joy, nurseryman, Shirley, Southampton, was an easy 1st; his plants were large, evenly trained, and freely flowered. Mr. Wills was 2d, with good plants, although smaller in size.

Mr. Joy also supplied the best six specimens of Japanese, with plants 5 to 6 feet in diameter, each one carrying about 150 stems of good quality—Bouquet Form and Peter the Great were the best.

With single specimens of both Japanese and incurved, the same places were occupied by these two exhibitors, the former staging a grand plant of Lady Selborne, while Mr. Wills relied upon Hiver Fleur, which was in capital condition.

CUT BLOOMS.

The principal class was that for sixteen incurved or reflexed and eight Japanese. This brought six competitors, Mr. Wills, gr. to Lord Eversley, Lockfield, Winchfield, was 1st; his incurved was large, solid, and of neat finish, while the Japanese were full and fresh, the best of these being Madame C. Andiguier, Maiden's Blush, and Madame Laing. The best among the incurved was Golden Empress, Queen of England, Jeanne d'Arc, and Princess of Wales, very fine; Mr. Wills was 2d with an even clean lot, not quite so weighty as the others. His best were Barbara, Val d'Andorre, and M. Barnet.

For twenty-four blooms not less than eighteen varieties, Mr. J. Allen was 1st, with large blooms, some of them a trifle too coarse—J. Delaux, Japonaise, Lord Alester, and Queen of England as the best.

Mr. Wildsmith repeated his previous success by taking 1st prize for twelve incurved blooms with varieties similar in character and quality to those in his leading stand.

Mr. Ward, Longport Castle, turned the tables on his former opponents by taking 1st for twelve Japanese varieties, with great solid flowers, Triomphe de la Rue Chatelets and Val d'Andorre being the best.

Anemone-flowered varieties were capitally staged by Mr. C. Penford, gr. to Sir F. Fitzwigram, Leigh Park, Havant, who won the 1st prize, his best being Empress, Lady Margaret, and M. Bertha Piggy.

Mr. Allen was the winner in the class for reflexed flowers, twelve in eight varieties; his stand contained many excellent blooms.

Mr. Neville staged the best pompons, which were well deserving of the award.

Mr. Carter, St. Denys, took the 1st prize among the amateurs with good specimens.

MISCELLANEOUS PLANTS.

Mr. Osborne, gr. to J. Bachan, Esq., Wilton House, Southampton, gained the 1st prize for a collection of Orchids, staging a neat group of admirably grown plants, the best of which were Dendrobium formosum, Ocidium divaricatum, Cattleya maxima, and Calanthes of various species; Mr. Molyneux, Swanmore Park, Bishop's Waltham, had the best nine table plants, Mr. J. Reynolds exhibited the best collection of Primulas, and Mr. Budd the best Cyclamens.

FRUIT.

For three distinct varieties of Grapes, one bunch of each, Mr. T. Hall, gr. to Captain Davidson, South Stoneham House, Southampton, was 1st for Alicante, large in bunch, berry, an colour quite first-rate; Black Barbarossa, good bunch, the berries small, but of capital finish; the other bunch was one of Muscat of Alexandria, plump, and of good quality. Mr. Molyneux followed closely, his bunch of Barbarossa, weighing from 5 to 6 lb., large in berry, and fine in colour, was all that could be desired; the Black Alicante was of good shape and finish, while that of Trebbiano was likewise fine in every point. 3d place was occupied by Mr. C. Warden, gr. to Sir E. Bathurst, Clarendon Park, Salisbury, who staged good bunches of Muscat of Alexandria, Gros Colmar, and Black Alicante.

For three bunches of Black Grapes, Mr. Molyneux was distinctly ahead with Broussais, each weighing from 5 to 6 lb., large in berry, and thoroughly coloured; Mr. Hall followed with Alicante, large in bunch, finely coloured, but the berries were rather small; 3d, Mr. Ward, with Mrs. Pince.

The best three bunches of white Grapes were staged by Mr. Chalk, gr. to G. Read, Esq., Westwood, Wilton Road, Salisbury, which were very fine in every respect; they were also the bunches of Muscat of Alexandria which he put up.

For two bunches of black Grapes, Mr. Penford supplied the best, fine examples of Alicante; 2d, Mr. C. Warden, very fine in quality, although smaller than the preceding. The heaviest bunch was Barbarossa, 8 lb., belonging to Mr. Ward; while Mr. Molyneux ran this very close with the same variety, only 1 lb. less in weight.

Mr. Wildsmith staged the best Pine, a fairly good specimen.

Mr. Sanders was an easy 1st for four dishes of Peas with extremely large specimens—Pitaston Duchess, General Todleben, and Uvedale's St. Germain.

LAMBETH AMATEUR CHRYSANTHEMUM: November 8, 9, and 10.

TITTS prosperous Society held its twelfth exhibition on the above date, at the Bridge House Hotel, London Bridge, S.E. A very good display of both blooms and plants was made, and especially so when it is remembered that the exhibits must be grown within a radius of 1½ mile from the "Elephant and Castle," Newington. Among the cut blooms the Japanese varieties were best shown, though the incurved forms were not far behind in merit.

PLANTS IN POTS.

There were three large groups (80 square feet) of Chrysanthemums in pots, the finest being that of Mr. J. A. Howett. The incurved varieties, which were most numerous, were well shown, the large even blooms being such as might well be staged at more pretentious shows. Mr. Dixon, Mr. Rundle, and George Glenn, were especially noticeable. Mr. Haddon's group was 2d, with large numbers of well-flowered Japanese varieties.

Mr. Williams received the 1st prize in the class for six standards; the plants were nicely trained and well flowered. This lot also received the Silver Cup offered for the best six trained plants in the show. He was also 1st with three dissimilar standard plants.

Standard pompons were well shown by Mr. H. Ellis; the flowers here were very beautiful and clear; a very close 2d was Mr. Davison, while the best untrained specimens were from Mr. J. A. Howett; his plants were massive, with good bright flowers. The dwarf pompons of Mr. H. Ellis, who was awarded the 1st prize for them, were very good plants, of fine size.

A nicely arranged group of well grown plants was that of Mr. Wibley. This was not for competition, and comprised, amongst others, good plants of various Palms, Dracaenas, &c., and a few Chrysanthemums, which added to its elegance.

CUT FLOWERS.

The Japanese forms, as previously stated, were the best. In the class for twelve blooms, dissimilar, Mr. T. Childs was awarded the premier award; he had very fine blooms of Grandiflorum, Gloriosum, La Triomphe, Madame C. Audiguer, and Fair Maid of Guernsey: the whole lot were very fine and fully deserved the award. Mr. H. Ellis was a close 2d. The Cossack, Le Chinois, and Val d'Andorre being the finest forms.

For twelve incurved there was a good competition the premier award going to Mr. Haddon for a creditable collection, the best varieties were Prince Alfred, Nil Desperandum, Golden Beverley, White ditto, and Guernsey Nugget. Mr. J. A. Howett was a close 2d with smaller flowers.

The first twelve Anemone-flowered Chrysanthemums were from Mr. Clarke & Co.; all were finely grown and clean—Fleur de Marie, Gluck, Acquisition, being very fine. The chief prizes in other classes were also taken by the above-named exhibitors.

WILTS HORTICULTURAL SOCIETY'S CHRYSANTHEMUM SHOW:

November 11 and 12.

As the result of letters written to the Salisbury papers by Dr. F. W. Coates and a gardener in the neighbourhood a few weeks ago, a successful exhibition of Chrysanthemums and fruit was held in the Council Chamber, Salisbury, on the above dates, and notwithstanding the unfavourable weather, was well attended.

Messrs. Keynes & Williams, of the Castle Street Nurseries, made a fine display of fresh, well flowered plants of Chrysanthemums in the entrance hall, in which two well grown specimens of *Araucaria excelsa*, staged by the same firm, were very effective. Messrs. Brittain & Son, of the Waterloo Nursery, Salisbury, had two good and effectively arranged groups of Chrysanthemums in the barqueting-room, but, like Messrs. Keynes, Williams & Co.'s collection, not for competition.

GROUPS.

There were two classes provided for these in the schedule—one to consist chiefly of Chrysanthemums in pots, and the other group to be composed of miscellaneous plants, and these (eleven in all) were admirably arranged. In the former class Dr. F. W. Coates was 1st, with a very good arrangement of well grown plants, the flowers of which were large, fresh, and substantial.

Mr. E. L. Brown, Portland Place, Salisbury, had the best group of miscellaneous plants; Mr. John Curry, gr. to Colonel Pepper, Elm Grove, Salisbury, was 2d: this group would have been better had there been fewer plants in it.

CUT BLOOMS.

Seven classes were provided for these in the schedule, and, though the competition was not keen, many beautiful blooms were shown, including several stands of winners from the Southampton show.

In the class for twenty-four blooms Mr. H. W. Ward, gr. to the Right Hon. the Earl of Radnor, Longford Castle, Salisbury, was 1st with a good even fresh lot of blooms of fine kinds; Mr. C. Warden, gr. to Sir F. H. Bathurst, Bart., Clarendon Park, Salisbury, was a good 2d, the kinds chosen being similar to those in the winning stand.

Mr. Ward was also for two incurved blooms, as he also was for six blooms incurved. Mr. Ward was again 1st with a good stand of twelve Japanese of the most approved varieties. Mr. Ward had the best six blooms of Japanese, and Mr. G. Marlow the second best. Mr. Ward was also 1st for six blooms of reflexed, and for six Anemone-flowered blooms, showing good all-round blooms in the seven classes.

FRUIT.

This was shown in the grand jury room. Mr. Ward was the only exhibitor of a collection of six kinds of fruit, and he was awarded 1st prize for a good even lot, consisting of Queen Pine, Muscat of Alexandria, and Mrs. Pince's Black Muscat Grapes, a highly-coloured and nicely netted fruit of Longford Perfection Melon, Cox's Pomona Apple, and Chautomont Pear.

Grapes.—Mr. Warden was 1st out of three competitors for two bunches of Black Alicante, showing compact, well-finished bunches.

Mr. E. L. Brown was 1st for any other black variety, with good examples of Gros Colmar; Mr. Ward being 2d, with Gros Guillaume.

Out of three lots of Muscat of Alexandria Mr. Warden was a good 1st.

Mr. Ward was a good 1st for any other white than Muscat of Alexandria, with two fine bunches of Trebbiana.

The last-named exhibitor staged (not for competition) several large bunches of Mrs. Pince's Muscat of

Alexandria, and Gros Guillaume Grapes, including one of the latter over 8 lb., together with several dishes of Apples, Pears, &c.

Mr. Warden staged (also not for competition) four creditable bunches of Grapes, including Muscat, Gros Colmar, and Black Alicantes; and Mr. William Marlow showed a good Orange tree heavily laden with golden fruit.

Apples and Pears were shown well, both dessert and culinary kinds, the prizes going to local exhibitors.

Tastefully arranged bouquets of various patterns were shown in numbers, and elicited much admiration.

EDINBURGH BOTANICAL: NOVEMBER 11.

THE Society met this evening at 5, St. Andrew Square, Professor Dickson, President, in the chair.

During private business Miss E. A. Ormerod, Dunster Lodge, Isleworth; and Miss C. Owen, Knockmullen, Gorey, Ireland, were elected Associates.

The following office-bearers were elected for the session 1886-87:—

President: Professor Dickson, M.D., LL.D., F.R.S.E.

Vice-Presidents: Alex. Buchan, M.A. F.R.S.E.; Hugh Cleburne, M.D., LL.D., F.R.S.E.; Robert Lindsay, Rev. John Macmurtrie, M.A.

Councillors: Symington Grieve, Andrew Taylor, F.C.S.; William Sanderson, Rev. J. M. Robertson, M.A.; William Watson, M.D.; Robert Gray, F.R.S.E.; William Craig, M.D., F.R.S.E.; F.R.C.S.E.; William B. Boyd, of Faldonside; Thomas A. G. Ballour, M.D., F.R.S.E., F.R.C.P.E.; Malcolm Dunn, Dalkeith Palace Gardens.

Honorary Secretary: Professor Sir Douglas MacLagan, M.D., LL.D.

Honorary Curator: the Professor of Botany.

Foreign Secretary: Andrew P. Aitken, M.A., D.Sc., F.R.S.E.

Treasurer: Patrick Neil Fraser.

Assistant Secretary: John M. Macfarlane, D.Sc., F.R.S.E.

The following communications were read:—

1. "Notes on Three Rare Welsh Plants," illustrated by specimens. By A. D. Webster, Llandegai, Penryn. The plants in question were *Lloydia serotina* (Reichb.), *Cotoneaster vulgaris*, and *Potamogeton Griffithii*.

2. "On Australian and New Zealand Plants growing in Arran, with supplement in regard to West of Scotland." By Rev. P. Landsborough, Kilmarnock.

3. "On a supposed New British *Sagina*." By Dr. F. Buchanan White. This plant was brought from Braemar in 1878 by Mr. Boyd, of Faldonside; it is distinct from *S. procumbens*. The author proposed to name it *S. Boydii*.

4. "Record of the Occurrence of *Trichomanes radicans* in Arran." By W. B. Simson, Dundee. Mr. Simson gave in detail the narrative of his discovery of *Trichomanes radicans*, which had grown from a small rhizome originally found by him in Arran in 1863. Mr. Lindsay exhibited a large number of flowers from the open air, including Dahlias, Geraniums, Lobelias, Calceolarias, Senecio speciosus, Apogoneton, &c. He also exhibited from the garden a plant of *Eucalyptus Gunnii*, raised from seed ripened at Whittinghame, East Lothian, last year, and the new *Sagina Boydii*.

Dr. Paterson, Bridge of Allan, sent for exhibition a plant of *Dryckia rariflora*.

Mr. Simson, Dundee, exhibited a large plant of *Trichomanes radicans*, which had grown from a small rhizome originally found by him in Arran in 1863.

Mr. Lindsay exhibited a large number of flowers from the open air, including Dahlias, Geraniums, Lobelias, Calceolarias, Senecio speciosus, Apogoneton, &c. He also exhibited from the garden a plant of *Eucalyptus Gunnii*, raised from seed ripened at Whittinghame, East Lothian, last year, and the new *Sagina Boydii*.

Several of the papers read at the meeting, for which we are unable to find space this week, will appear in a subsequent issue.

CHRYSANTHEMUM SHOW AT LEWISHAM.

The Lewisham District Floral Society having brought their summer exhibition to a successful issue, made bold to hold an autumn Chrysanthemum show also. This was held on the 12th and 13th inst. at the Ladywell Public Baths, and proved a very decided success. Exhibits were numerous and extremely good; the competition, generally keen in all classes, especially in that for forty-eight blooms.

Miscellaneous exhibits included a very fine group

of large dimensions from Messrs. John Laing & Co., Forest Hill, this being much the finest group exhibited by them this season. Mr. H. J. Jones, Hope Nurseries, Lewisham, also staged a very fine group, equal in size to the above; the two groups together, placed side by side in front of the stage—which was also liberally decorated with large Palms from the Stanstead Nursery—giving a charming effect to the whole. Messrs. Connell & Sons, Swanley, sent bright masses of zonal Pelargoniums, Chrysanthemums, &c.; Messrs. Carter & Son, Holborn, collections of flowering, berried plants, &c.; Messrs. Bunyard & Son, Maidstone, an exceptionally fine collection of Apples; Mr. Laders a dozen dishes of fine dessert Pears, &c.—these with the competitive exhibits together filling two large rooms.

POT PLANTS.

These consisted of groups of Chrysanthemums arranged in a space of not more than 50 square feet. There were five competitors, Mr. W. E. Jupp, Brockley, being 1st.

A similar class for gentlemen's gardeners only, found F. W. Prior, Esq., Blackheath, and J. Soame, Esq., J.P., respectively 1st and 2d.

Minor classes for specimen plants were well represented, Mr. W. Smith, Catford, Mr. L. Luters, and Mr. J. W. Upton, being 1st in the three classes, which also were liberally decorated with large Palms (not Chrysanthemums), an effective arrangement, were shown by Mr. C. Nunn, gr. to J. Soames, Esq., Greenwich Park.

CUT FLOWERS.

For forty-eight blooms, twenty-four Japanese and twenty-four incurved, Mr. Moore, Blendon Hall, Bexley, was 1st, having amongst others very fine blooms of John Salter, Thunberg, Flambeau, &c. Mr. Bettesworth, gr. to R. Ewing, Esq., Burton Grange, Chesham, was a good 2d, showing Comte de Germiny, Golden Salter, Lord Wolsley, and Princess Imperial, in rare form.

Classes for twelve Japanese, distict, and twelve incurved, distinct, with a minor one on two besides, proved Mr. H. Shoemith, gr. to the Rev. Canon Hodgson, Hythe, 1st in each, a grand bloom of Jeanne Delaux appearing amongst the former.

Twelve Japanese or large flowered Anemones (class 2d), were well staged by Mr. J. Hudd, gr. to F. W. Prior, Esq., Blackheath Park, who took 1st prize. Mr. C. Nunn was a good 2d with finely formed blooms.

In the two classes for twelve incurved and six incurved, Mr. J. W. Banner, Brockley, won both 1st prizes; Mr. J. W. Upton taking 2d in the former class, having also therein the finest bloom in the show amongst amateur exhibitors.

Mr. J. J. Hillier was 1st with twelve blooms incurved and six blooms Japanese Anemones.

Mr. C. Lambert was 1st for two blooms, incurved, in the amateur members' classes, Mr. T. Wickham Jones being the fortunate winner of 1st prizes for twelve Japanese, six Japanese (one variety); Mr. J. W. Upton, Limes Grove, proving a very fine 2d in the third class.

Mr. F. T. Shipley was 1st for six incurved flowers.

TABLE DECORATIONS AND HAND BOUQUETS.

For the former, an arrangement upon a table, 6 feet by 4 feet, Mrs. Jupp was 1st; Miss Edith Brooks, Eltham, 2d; and Mrs. Berry 3d.

The hand bouquets were extremely good, especially as they consisted of Chrysanthemum flowers only. The judges ultimately awarded 1st prize to Mr. H. J. Jones.

One of the best features in the show was the display made in the competition for the best basket of Chrysanthemums; here Mrs. T. Wickham Jones distanced all competitors, winning 1st prize with a chaste arrangement made up of a few fine blooms only of purple-bronze and yellow coloured blooms. *W. E.*

READING CHRYSANTHEMUM: Nov. 12.

THIS is a distinct organisation from the Reading Horticultural Society. It was the third annual exhibition, and the success of it is mainly due to Mr. Richard D. Catchpool, the Hon. Sec., who works very hard to this end. The exhibition took place, as usual, in the municipal building, and both Town Halls were called into requisition. The exhibition was a large and distinctly good one, plants and flowers alike being very fine indeed, while fruit was well represented. Mr. Catchpool had distributed about the old Town Hall a number of cage birds, and they sang very sweetly during the afternoon, having the hall to themselves, as the band was in the new building. The arrangement of the exhibits was carried out by Mr. J. Turnton, The Gardens, Maiden Elridge.

PLANTS.

In the class for a collection of plants arranged for effect Mr. Baskett, gr. to W. J. Palmer, Esq.,

Reading, was 1st with an excellent lot of plants of natural growth admirably arranged, the blossoms of capital quality.

The best six specimens, Japanese excluded, came from Mr. R. Booker, gr. to R. Tomkins, Esq., Reading, who had well grown and flowered specimens.

Mr. Surman, gr. to C. H. Witherington, Esq., Sonning, had the best three specimens.

Mr. Surman had the best six Japanese varieties, staging remarkably well grown and flowered plants of La Nymph, La Charmeuse, Lady Selborne, Bronze Dragon, Peter the Great, and Elaine; 2d, Mr. Farey, with good specimens of Peter the Great, James Salter, Lady Selborne, Red Dragon, Hiver Fleur, and La Charmeuse.

Mr. Franklin had the best three specimens, having admirable plants of James Salter, Elaine, and Peter the Great; 2d, Mr. Armitage, with Elaine, Peter the Great, and Mons. Delaux.

Standard plants were well grown and flowered, but tied down much too close. Mr. Booker had the best three. Mr. Armitage had the best standard specimen.

Pompon varieties were shown in good specimens also, though there was no entry in the class for six plants.

Mr. Surman had the best three, having well grown and flowered plants.

The best standard pompon was Mdle. Marthe, a charming plant, naturally grown and finely bloomed, from Mr. W. T. Abrey, nurseryman, Tilehurst.

CUT FLOWERS (INCURRED).

The cut flowers throughout were remarkably good, and the incurred varieties were a decided advance upon anything we had previously seen at Reading.

Messrs. W. & G. Drover, nurserymen, Fareham, were 1st with a very fine lot of the leading kinds. 2d, Mr. W. Wildsmith, gr. to Lord Eversley, Heckfield Place, who was very close up with some remarkably good blooms, amongst them a variety, Lord Eversley, a charming white sport from Princess of Teck, and as Mr. Wildsmith exhibited four other blooms of it, it was awarded a First-class Certificate of Merit. It is a flower of excellent build, and of the best quality.

The best twelve blooms came from Mr. W. R. Strong, Wellington College, who had very fine examples of Princess of Wales, Lord Wolsley, Golden Empress, and Mr. Brunles; 2d, Mr. Trioder, gr. to Sir H. Mildmay, Bart., Dogmersfield Park, Winchester, with a very good lot indeed.

As there were six eighteens and two twelves, the competition was very keen indeed. There were five lots of six incurred blooms, the best coming from Mr. Jennings, gr. to J. T. Freeman, Esq., Farborough.

REFLEXED VARIETIES.

These were numerous and very freely shown; there were eight stands of twelve blooms, and Mr. W. Wildsmith was 1st, with the very finest lot we have seen this season, large, solid, and well coloured; 2d, P. Southby, Esq., Bampton, Oxon (Mr. Neal, gr.), also with six blooms.

JAPANESE CHRYSANTHEMUMS.

These, as might have been expected, were very numerous, wonderfully effective, large, and of the best quality. How extensively they are being grown was shown by the fact that ten stands competed in the class for that number of varieties. Mr. Baskett, gr. to W. J. Palmer, Esq., Reading, was 1st, with a very fine lot.

Mr. J. Freeman, Farborough, had the best six varieties, staging a half-dozen very fine blooms in a class where there were ten competitors.

ANEMONE FLOWERED.

Mr. Kendall, gr. to W. S. Holland, Esq., Rotherhampton, had the best twelve Anemone-flowered varieties, setting up fine blooms of the choicest.

POMPON VARIETIES.

Mr. Wildsmith had the best six bunches of these, staging large and well flowered trusses of Adèle Fresette, Mdle. Marthe, Lizzie Holmes, Marguerite de Coy, Mr. Astie, and G. Nachel. 2d, Mr. Holland, with single blooms, disbudded to produce.

One very interesting class was for twelve large-flowered Chrysanthemums, in eight varieties, shown as grown; and in this case they were set up on stems with 6 inches or so of foliage—a good way in which to exhibit blooms. Here Mr. Wildsmith was again 1st with fine blooms of Princess of Wales, Jardin des Plantes, Jean d'Arc—incurred varieties, mostly in duplicate, and the following Japanese:—Maiden's Blush, Mad. C. Audigier, Mignon, Japonaise, l'Adorable, and Cullingfordi; 2d, Mr. Baskett, all being Japanese varieties.

Mr. Phippen, nurseryman, Reading, had the best bouquet of Chrysanthemums, Mr. Howe, gr. to J. O. Taylor, Esq., Reading, had the best vase of Chrysanthemums; 2d the best stand of cut flowers and foliage

came from Messrs. Phillips. Messrs. Phillips also had the best stand of autumn leaves, flowers, and berries. These were admirably arranged.

MISCELLANEOUS PLANTS.

Prizes were offered for plants for table decoration, i.e., berried plants, the berried Phytolacca and Solanum being prominent; for Chinese Primulas, Poinsettias, Bouvardias, Violets, Epiphyllums, &c.—all of which might be dispensed with, and the money given to the classes for Chrysanthemums, in which there is a large and close competition. The best stand of six "Last Rose of Summer," came from Mr. J. Trauter, Henley-on-Thames, very good indeed for the season of the year.

FRUIT.

There was a good representation of fruit, though Grapes were not so good as in former years.

The best two bunches of Black Alicante came from Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood Park, Basingstoke.

Mr. Moore, gr. to Mrs. Hay, Braywick, Maidenhead, had the best two bunches of Gros Colmar.

The best two bunches of any other black kind were Cooper's Black, from Mr. Wills, gr. to R. Ravenhill, Esq., Winkfield.

Mr. Pope, The Gardens, Highclere Castle, had the best two bunches of White Muscat.

In the class for two bunches of any other white kind, Mr. Turton, Maiden Eleigh, was 1st with Trebbiano.

Mr. Howe had the best collection of six dishes of ripe English dessert fruit.

Mr. Turton had the best six dishes of dessert, and also of culinary Apples.

Mr. Trioder had the best four dishes of Pears. Despite the wet weather, the show was remarkably well attended.

WATFORD CHRYSANTHEMUM :

November 16 and 17.

The first show of this Society, which was held in the Agricultural Hall, Watford, on the above named dates, promises well for the future.

GROUPS

were the great feature here, occupying, indeed, the whole of the ground floor of the building, and many were comprised of plants of first-class quality. The competition in the leading group classes was very keen, and the successful competitors generally deserved the recognition received.

In this section the leading class (open) was for a group to occupy a space of not more than 50 square feet. There was a good competition between the seven groups shown, in which the highest award was taken by Mr. J. Fitt, gr. to the Earl of Essex, Casbury Park, Watford, for a tastefully arranged group of excellent quality, the plants well grown and strong, Japanese varieties greatly preponderating. A few pompoms were judiciously placed along the front. Mr. W. Cox, gr. to W. Thompson, Esq., The Warren, Bushey Heath, received the 2d prize for a group of smaller plants very effectively arranged. 3d, Mr. T. Waller, gr. to H. G. Stephens, Esq., Finchley.

In the class for groups of miscellaneous plants there was also an extensive and keen competition. Mr. E. Beckett, gr. to H. H. Gibbs, Esq., Aldenham House, was the leader here, and took the 1st prize with a group containing many plants of excellent quality, Palms, Crotons, and Ferns being the chief foliage plants, whilst colour and grace were given by various Orchids, Bouvardias, Primulas, Chrysanthemums (which were very fine), and Anthuriums; Mr. J. Dismore, gr. to T. J. Blackwell, Esq., The Cedars, Harrow Weald, was 2d, his group containing more flowering plants than the former; Calanthes were the most prominent, forming the groundwork, which was consequently very bare. The 3d place was given to Mr. Condie, gr. to S. J. Blackwell, Esq., Harrow Weald, for a compact group of tasteful arrangement and containing Eucharis and Chrysanthemums, and the usual foliage plants.

For a group of 50 feet (members only) Mr. J. Fitt was again 1st, the grouping being similar to that in the open class; the 2d was from Mr. J. G. Barnes, gr. to C. R. Humbert, Esq. (the secretary), Dell Field, Watford, for a group of plants of fair quality, which, however, were too much drawn.

The best group in a space of 25 square feet was shown by Mr. C. Chapp, gr. to Mrs. H. Manning, North End House, Watford. The group was circular, and the consequent difficulty of arrangement well surmounted. The plants themselves were of good quality. Mr. J. G. Barnes was 2d with dwarfier plants.

The 1st prize for a specimen plant from a member was awarded to Mr. C. Chipp, the variety shown being Madame Rendler; 2d prize going to Mr. J. G. Barnes for a better grown plant, with clear and bright blooms.

Three specimen plants, open, were best shown by Mr. Henry Fety, Drumak Street, Watford—Ehel, Mrs. Dixon, and Christine being the varieties. They were all good plants, trained well, and evenly flowered. Mr. G. P. Darby, High Street, Watford, was 2d, with plants of medium quality.

Plants for table decoration were shown, prizes being taken by the above-named exhibitors.

CUT BLOOMS

were not very numerous, but on the whole well shown, especially in the Japanese classes, where some very fine blossoms were shown.

Mr. E. Beckett had the best twenty-four incurred, staging a collection of fair quality blooms, among which Lord Alcester, Queen of England, Empress of India, Venus, Golden Empress, Barbara, and Nil Desperandum were the finest. Mr. G. Beard, gr. to C. J. Hegan, Esq., Bucknalls, Watford, took the 2d prize with rather irregular blooms, Golden Empress, Prince Alfred, and Novelty, being especially fine. Mr. C. Brown, gr. to R. Healy, Esq., Langley House, Abbots Langley, was 2d, showing fine blooms of the same varieties as Mr. Beckett.

In the open class for twenty-four incurred better blooms were shown throughout, Mr. E. Beckett again securing the premier award with almost the same varieties. Mr. J. C. Mundell, gr. to Lord Ebury, was 3d, with a stand of smaller but well finished blooms.

Mr. E. Beckett also staged the best six incurred (one variety), showing in fine form Princess of Wales; Mr. Rumbold, gr. to G. Lake, Esq., Bushey, followed with Empress of India, also good.

For twenty-four Japanese, Mr. Beckett staged a very good lot of large and clean flowers, and justly received the highest award; especially fine blooms were shown of Madame J. Laing, Saronia, Madame C. Audigier, Boule d'Or, Marguerite Marrouch, Dornillon, and Val d'Andorre. The next collection in order of merit was Mr. Condie's; this was also a good lot, and followed closely on the 1st prize; Roseum pictum, Mons. Huibert, Bronze Dragon, and Grandiflora were the finest blooms.

The finest show of Japanese blooms, however, was in the open class for twenty-four varieties, and here Mr. Beckett distinguished himself once again with his former varieties; the 2d was taken by Mr. J. Fitt, with creditable samples of Grandiflora, Ehel, Fair Maid of Guernsey, Criterion, Peter the Great, and Japonaise.

Mr. C. Brown staged the best twelve reflexed, having good samples of Cullingfordi, Peach Christine, and King of the Crimson. Mr. Mundell was awarded 2d for a good stand including Cullingfordi, Cloth of Gold, and Progne.

Anemone-flowered varieties were best shown by Mr. C. Brown, whose stand fully deserved the 1st prize, which was awarded (he was the sole exhibitor). His best were Lady Margaret and Empress. Mr. Beckett and Mr. Mundell were the successful exhibitors of pompoms, and received prizes in the order of the names.

FRUITS AND VEGETABLES.

Grapes were well shown, some fine specimens being staged by Mr. Beckett, who carried off 1st prize with Black Alicante. Mr. J. C. Mundell and Mr. Fitt were 2d and 3d with good bunches of the same.

All the leading prizes in Apples, Pears, &c., were also taken by these exhibitors. Other prize winners were Messrs. Cox, Burton, Barnes, and Carnfield.

The finest collections of vegetables from a member were from Mr. Beckett, and Mr. R. Stevens, gr. to Howard Gillett, Esq., Abbots Langley—both showing well. Mr. H. L. Sell, Luton, showed best in the open class. Cottagers' collections were also extensively shown.

NON-COMPETING EXHIBITS

were rather numerous. Mr. J. Fry, gr. to Capt. Edwards, Haydon Hall, Epsom, staged four very good fruits. Messrs. H. Laoc & Son, Berkhamstead, staged a large representative collection of Apples, especially noticeable, in which was Lane's Prince Albert, and the popular varieties. This firm also had a good group of Chrysanthemums.

A group of miscellaneous plants was arranged in the centre of the hall by Mr. J. Myers, gr. to the Earl of Clarendon, Grove Park, Watford. This was a very elegant and attractive exhibit, and consisted of well grown stone and greenhouse plants.

LUTON HORTICULTURAL.

The third exhibition of this Society was held on Wednesday, November 17.

GROUPS.

The principal feature was the groups of Chrysanthemums arranged for effect. Two groups, both containing some good flowers, were awarded equal 1st, the exhibitors being Mr. E. Couper and Mr. J. J.

Kershaw. For six specimen plants, Mr. Kershaw was also ist.

CUT BLOOMS.

These were only fairly represented, the Japanese being by far the best. For twelve incurved blooms Mr. Jarvis took 1st, and for twelve Japanese Mr. Kershaw received a similar award.

FRUIT.

Grapes were very poorly shown. Only one entry was made for a collection of fruit; this was awarded 2d prize, the 1st being withheld. Apples and Pears were better, but not of the usual quality.

VEGETABLES.

For a collection, Mr. Jones, Harpenden, was 1st with a good collection. Potatos, Cauliflowers, Beets, Turnips, &c., were shown in great quantity, the competition being keen.

AMATEURS AND COTTAGERS.

These showed well all round, the prizes offered bringing many competitors, who showed very creditably in the various classes.

A novel feature in the show was prizes offered for a collection of hardy wild fruits and berries. The 1st prize was awarded to Master James Bloomfield, who showed a very nice collection, well put up, and named.

TRADE NOTICES.

CHANGE OF PROPRIETORSHIP.

MR. J. TRANTER, a well-known amateur cultivator of Roses, Dahlias, &c., at Upper Assenden, has become the lessee of the nursery at Henley-on-Thames formerly in the occupation of the late W. E. Jones, and will carry on the business of nurseryman and seedsman.

JUBILEE ONION.

The seedling Onion called Shedwick, exhibited by Mr. W. Finlay, gr. to the Earl of Sondes, which obtained the 1st prize at the Royal Horticultural Society's show, Oct. 27 last, the stock of which was purchased by Mr. H. Deverill, Royal Seed Stores, Banbury, has been named the Jubilee. It is a magnificent Onion, the result of a cross between the imported White Spanish and Brown Portugal. *H. Deverill.*

SKETCHES OF WINTER GARDENS, &c.

We are informed that Mr. F. A. Fawkes, London Road, Chelmsford, will shortly bring out a work containing photo-lithographed sketches of some thirty winter gardens, ranges of hothouses, and ornamental conservatories of various sizes and designs erected in different parts of the country.

HANDLING THE TOBACCO CROP.

It will be remembered that among the growers who have this season tried Tobacco as a field crop, Messrs. James Carter & Co., of High Holborn, tested seventeen distinct varieties on land not far from Lower Sydenham station on the South-Eastern Railway. Planted at too late a time, and encountering an unfavourable season of growth, the crop, on well-manured ground, produced very fine tall plants bearing an abundance of leaves, at the rate of one plant to a square yard. After the crop had been caught more than once by four degrees of frost, it was deemed unsafe to delay cutting; and, accordingly, the plants were cut short off close to the ground, threaded butt-end upwards upon sticks, and the sticks of pendent stalks with their drooping leaves carried to the farm premises, and hung upon light wooden framing, filling the barn up to the lofty ridge-tree, with the plants suitably exposed to currents of dry air, the green succulent leaves not being crowded close together. Here it was intended to make use at once of artificial heat, by means of a big brazier placed on the barn floor, in which wood (preferably dry faggots of Wych Elm) was to be the fuel, a cap being arranged over the brazier in order to divert to the floor and dash out of combustion any sparks which might be dangerous. But for some weeks the Tobacco had unavoidably to be left to take the chance of the air temperature, owing to a delay in effecting the fire insurance. On a portion of the crop the desirable yellow colour which is acquired by quicker artificial heating was

sacrificed; and the fire was got into action only just in time to stop the mould, which had begun to set in. Ultimately the burning wood came to the rescue of the experiment, the smoke was not found detrimental to the quality and flavour of the Tobacco, and the plants have become perfectly desiccated, beyond a gumminess or viscidosity about the junctions of the leaf-stems and the central stalk; the colour is, for the most part, a rich golden brown, the texture fine, with a due toughness, and the skin of the leaves silky and glossy, the experts pronouncing the Tobacco leaves of admirable quality, the greater part for "fillers," but an ample proportion for "wrappers," so as to present the appearance which is valued in cigars made of well-grown Tobacco. The most approved varieties are Big Frederick, Florida, Yellow Fryor, Pennsylvania, Kentucky, Connecticut, and White Burley.

We witnessed on Friday, November 12, the process of preparing the dried plants for the market. There is no difficulty or particular nicety in the matter to require a careful training, as one might have supposed from the instructions which have been published by various authorities. One plant at a time is taken up, and as it is held the leaves are separated by stripping each leaf-stem or rib off from the fundamental stalk, and then another person picks up these separated leaves of one plant, places them together in a bunch, wraps a leaf round the thick ends, tucking one end over the leaf under, so as to hold the small bunch in what is called "a hand." Imperfect, torn, or green leaves called "lugs" are laid by themselves; and, like the "primings," or trimmings, or second shoots of the plants during growth, are kept for making an inferior kind of Tobacco. The central woody stalk, which is very short, is waste, but still the Excise regulations forbid its being utilised or merely thrown away. The stalks have to be burnt in presence of an Excise officer, but it is probable that a use could be found for them.

There appears no doubt that the Tobacco-growing experiment is a success all through as far as the practices of cultivation and preparation for the market are concerned. The "hands" of Tobacco in the stage which they have now reached may be preserved for any length of time in bulk; or they may be now forwarded any distance to a manufacturer, who will subject them to the necessary process of fermentation or curing for aroma and flavour. In their present state they are considered to be worth 6s. to 8s. per pound. Messrs. Carter's total crop of three-quarters of an acre is expected to weigh about 15 cwt., and if so, the market value must approach £42, or at the rate of £56 per acre. Of course this is outside any Excise duty. It is evident that Tobacco is not a difficult crop for a farmer to deal with, and it seems precisely adapted for small cultivators and their families to handle. But while the Excise authorities are giving facilities in minor matters, they have, at present, withheld any information as to any favourable or encouraging terms in conformity with which Tobacco may be grown next year by other than capitalist farmers and experimenters. It is desirable that the intentions of the Government should be made known without delay, as farmers who propose to undertake the culture of the profitable crop have to begin at once with preparation of the necessary quantity of land. *Times.*

16° on the 8th; the smallest was 8° on the 11th. The mean of the seven daily ranges was 10°.2.

The mean daily temperatures were 41°.4 on the 7th, 38°.2 on the 8th, 41°.5 on the 9th, 42°.8 on the 10th, 43°.2 on the 11th, 43°.2 on the 12th, and 43°.1 on the 13th. These were all below their averages with the exception of the 12th and 13th, which were 0°.3 and 3°.4 above, by 3°.3, 6°.1, 2°.4, and 0°.7 respectively.

The mean temperature of the week was 41°.9, being 7°.1 lower than last week, and 1°.7 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 95°.5 on the 8th. The mean of the seven readings was 62°.1.

Rain.—Rain fell on four days to the amount of 1.34 inch.

ENGLAND: Temperature.—During the week ending November 13, the highest temperatures were 54° at Truro, 51°.3 at Plymouth, and 51° at Leeds; the highest at Wolverhampton was 45°.7, at Bradford 47°.6, and at Blackheath and Sunderland 48°. The general mean was 49°.5.

The lowest in the week were at Wolverhampton, 26°.9, at Nottingham 29°, and at Truro, Blackheath, Sheffield, and Hull 30°; the lowest at Liverpool was 38°.7, and at Bradford and Preston 37°. The general mean was 32°.9.

The greatest ranges of temperature were at Truro 24°, and at Sheffield and Hull 20°; the least ranges were at Liverpool 10°, at Bradford 10°.6, and at Preston 12°. The general mean was 16°.6.

The mean of the seven high day temperatures was highest at Truro 52°, at Plymouth 49°.6, and at Newcastle 48°.5; and lowest at Wolverhampton 44°.3, at Bradford 45°.7, and at Preston 46°.1. The general mean was 47°.4.

The mean of the seven low night temperatures was highest at Liverpool, 40°.8, at Brighton, 39°.2, and at Preston, 39°; and was lowest at Hull 35°.4, at Wolverhampton, 35°.6, and at Sheffield, 36°.2. The general mean was 37°.8.

The mean daily range was greatest at Truro, 14°.8, at Hull 12°.4, and at Plymouth 12°.2; and least at Liverpool, 6°.1, at Bradford 6°.9, and at Preston 7°.1. The general mean was 9°.6.

The mean temperature was highest at Truro, 44°.1, at Liverpool 43°.4, and at Newcastle 43°.1; and lowest at Wolverhampton, 39°.4, at Sheffield 41°, and at Hull 41°.1. The general mean was 42°.1.

Rain.—The largest falls were 1.84 inch at Newcastle, 1.74 inch at Bristol, and 1.35 inch at Brighton; the smallest falls were 0.09 inch at Bradford, 0.17 inch at Leeds, and 0.23 inch at Preston. The general mean fall was 0.79 inch.

SCOTLAND: Temperature.—During the week ending November 13th, the highest temperature was 50°.3 at Perth; the highest at Greenock was 48°. The general mean was 49°.1.

The lowest temperature in the week was 33°.4 at Dundee; the lowest at Leith was 36°.5. The general mean was 34°.5.

The mean temperature was highest at Leith, 43°; and lowest at Dundee, 40°.7. The general mean was 42°.2.

Rain.—The largest fall was 1.35 inches at Greenock; the smallest fall was 0.33 inch at Perth. The general mean fall was 0.65 inch.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, NOVEMBER 17, 1886.

The Weather.

LONDON: Atmospheric Pressure.—During the week ending November 13, the reading of the barometer at the level of the sea increased from 29.26 inches at the beginning of the week, to 29.78 inches by the morning of the 8th, decreased to 29.28 inches by 5 P.M. on the 9th, increased to 29.58 inches by the morning of the 12th, and was 29.48 inches at the end of the week.

The mean reading of the barometer of the week at the level of the sea was 29.51 inches, being 0.32 inch lower than last week, and 0.47 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 48° on the 13th; the highest on the 9th was 45°.5. The mean of the seven high day temperatures was 46°.6.

The lowest in the week was 30° on the 8th; the lowest on the 12th was 38°.8. The mean of the seven low night temperatures was 36°.4.

The greatest range of temperature in one day was

- Nov. 11.—Wet and overcast all day.
- 12.—Fice, but dull till noon, occasional rain afterwards.
- 13.—Fice, but overcast and dull; bright at times.
- 14.—Generally fine; a slight mist in the evening.
- 15.—Overcast; frequent showers.
- 16.—Rain in early morning, fine and bright afterwards.
- 17.—Generally overcast, with frequent rain.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE IN THE UNITED KINGDOM, for agricultural and sanitary purposes, for the week ending Monday, November 15, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W. :—The weather has continued in a very dull, unsettled, and rainy condition over the whole kingdom.

The temperature has been above the mean in all districts, the excess being 1° or 2°. The highest of the maxima, which were generally recorded on the 15th, varied from 51° in "Scotland, N." and "England, N.E.," to 55° over the southern and western parts of England and in the south of Ireland, and to 57° in the "Channel Islands." The lowest of the minima, which were registered in most places on the 9th, ranged from 25° to 27° in Ireland, from 31° to 34° in Scotland, and from 31° to 35° over England; and in the "Channel Islands" the minimum was no lower than 42°.

Rainfall has been rather less than the normal amount in "England, N.E.," "England, N.W.," "England, S.W.," and the "Channel Islands," but more in all other districts; in "England, E.," and "England, S.," the excess has been very considerable.

Bright Sunshine shows a very general decrease, the percentages of the possible amount of duration varying from 7 in "Scotland, E.," and 8 over central and southern England, to 23 in "England, N.E.," and 25 in "Ireland, S."

Depressions observed.—The distribution of barometric pressure has been rather irregular, and the movements of the depressions very erratic. During the greater part of the period the barometer was comparatively high, both over Spain and Scandinavia, while in the intervening regions (*i.e.*, over the North Sea, the United Kingdom, and the Bay of Biscay) numerous small depressions have appeared. Some of these disturbances have travelled in a south-south-easterly direction over the more western parts of our islands, while others have moved in a north-north-westerly direction over the North Sea. At the close of the week the conditions were somewhat less complex, a depression which had travelled south-south-eastwards to the neighbourhood of Bristol, and afterwards east-north-eastwards was disappearing over the Baltic, while a rather deep disturbance had approached the north of Scotland from the Atlantic. The winds have been very variable in duration, and, with few exceptions, light or moderate in force, but towards the end of the period a south-westerly current had become general over our islands.

Enquiries.

"He that questioneth much shall learn much."—DAGON.

ROSE OF SHARON.—Fifty years ago I knew a Rose under this name. What is it? Can it be had now? I do not find it in any Rose Catalogue. *Diss.*

Answers to Correspondents.

TO THE TRADE.—Members of the Trade will oblige by sending notes of matters of Trade Interest, Cultural or Commercial. Short notes of daily experience are what are most useful.

A BOOK ON LAYING-OUT A GARDEN: *A Constant Reader*. How to Lay-out a Garden, by Ed. Kemp. London: Bradbury, Agnew, & Co., 11, Bowler's Street, E.C.

COLLETTIA CRUCIATA: C. E. We flowered this in the open on Middlesex clay for many years till the fatal winter of 1880 killed it. It is the same as C. bictonensis, and moreover is only a form of C. spinosa. You will find the proof of this, accompanied by illustrations, in the *Gardeners' Chronicle* for 1878, vol. ix., p. 243.

FLOWERING EVERGREEN AND BERBERID PLANTS TO COVER A WALL: E. W. Etham. "Cratægeus pycnantha," "Pyrus japonica," P. alba, P. princeps, and P. Mauldi; Eonymus radicans; Bignonia radicans and B. capreolata; Ampelopsis Vetchii; Lonicera reticulata; arca, japonica, and other species; "Hedera of all kinds; Escallonia macrantha; "Berberis Darwini

and B. stenoophylla; Ambrosiopsis coccineum; Lardizabala biterata; Aristolochia Siphio; Clematis of many varieties; Passiflora corallina; Banksian and other Roses; Camœlis in variety; Jasminum officinale; J. revolutum, &c. Those with an asterisk bear berries or fruits.

INSECTS: *J. T.* The insect found on your *Iberis corcectolia* is a grasshopper (Ephippiger sp.), apparently *E. vitium*, found among vines in middle and south Europe. Evidently imported with plants from abroad. *T. O. W.*

FUNGUS: *G. P. York.* The fungus with the "stag's-horn" appearance is *Clavaria fastigiata*; the red jewel example is *Hypophorhus coccineus*; the "columnar one," a "deformity," as you say—such deformities are common late in the season; the "small white one" we cannot see.—*S. F. S.*, *Sewenolds.* The name of the fungus growing in tufts under Holly, and which you aptly compare with large yellow *Chrysanthemum* flowers sown on the ground, is *Clavaria fusiformis*. It is not uncommon. *W. G. S.*

NAMES OF FRUITS: *J. Barclays.* Duchesse d'Angoulême.—*Weston Birk*, 1, Hoffer's Golden Reineette; 2, Fearo's Pippin.—*R. Tucker*, 1, Louise Bonne de Jersey; 2, Glou. Monarch.—*H. Rogers.* Apples: *Apples*. Fearo's Pippin.—*J. W.* 1, Flemish Beauty; 2, Emille d'Heyst; 3, Swan's Egg; 5, Vicar of Winkfield; 6, Beurri Duhaime; 7, 12, Glou. Moreau; 8, Catillac; 10, 15, Bergamotte d'Esperey; 11, Foret; 12, 13, 14, 15, Beurri Grig d'Hiver; others not recognized.—*G. B. H. Apples*: 2, Bedfordshire Foundling; 3, Cellini; 4, Hawthornden; 6, not recognized. *Ferraris*: 1, Beurri d'Arnhem; 5, Nakhon.—*J. James Hopkins*, 1, Cox's Orange Pippin; 2, Flower of Kent; 3, Duchesse d'Angoulême.—*Rogers.* *Received without letter*: post-mark *Troubridge*. *Held attached with blue string*: 5, Beurri d'Arnhem; 6, Knight's Monarch; 7, Marie Louise; 8, Easter Beurri; 9, Marechal de la Cour; 10, Brown Beurri; 12, Chaumontel; 13, Beurri Del; 18, Napoleon; 21, Donny du Cornic; 22, Beurri d'Arnhem; 24, Beurri Bachelier.—*A. Subscriber*, 1, Van Mons' Lion le Clerc; 2, Hacon's Incomparable; 3, Knight's Monarch.—*W. Farrant*, Passe Crassane.—*J. T. S.* 1, Winter Hawthornden; others not known. Your Peas are certainly undergoing a strange process of decay, which we are unable to account for at present.

NAMES OF PLANTS: *O. W. P.* *Bouvardia longiflora*; *Dracena marginata*. The piece of an Orchid is covered with a species of white scale.—*Redwood*. *Salvia aurea*.—*T. H. R.* Numbers and specimens mixed. Large fruit and green leaves, *Cratægea punctata* variety; large brown leaves and small fruit is a form of *Cratægea coccinea*.—*C. D., Kyde*. *Umbellularia californica*.—*Southampton*. The specimen sent was insufficient for us to name.—*E. M. P.* *Abies* *Millieriana*; 1, B. 1, *Adiantum Capillus-Veneris*; 2, *Adiantum formosum*; 3, same as No. 1; 4, *Cyrtium caryoidum*; 5, *Davallia Tyermani*; 6, *Davallia ballata*.—*C. D. M.* 1, *Pilea muscosa*; 2, we are unable to name the Rose from the specimen sent, please forward a bloom. The "Emil" Rose we do not know, but it is probably an American species.

PRODUCE OF AN ACRE OF GROUND: *G. H. B.* That would depend on the mode of culture. If very good, and not much of it under Potato crops, a garden of that size can be made to supply a family of eight persons with almost every ordinary vegetable and fruit required for the kitchen and the dessert. The soil to be tendered easier if the area were surrounded with walls, or partially so. We cannot say anything as to value of produce, as that would be ruled by the quantity and quality, lateness or earliness, &c.

STOVE PLANTS SHOWN AS GREENHOUSE PLANTS AT EXHIBITIONS: *Empireis*.—In the southern parts of Great Britain the former are commonly grown during the summer in a greenhouse, and the greenhouse plants out-of-doors, but as a rule stove plants go into the stove in the winter even there, and greenhouse plants are brought from the open air and placed in the greenhouse, so that, notwithstanding the summer treatment, each division is sufficiently marked by its mode of culture. We think judges should distinguish a group of greenhouse plants in which stove plants, so called, rightly belong to the stove, as it would be destroyed if kept as a true greenhouse plant in the winter.

VINE BORDER: *C. M.* The border can be made at once, and the vines replanted, as soon as it is finished. Do not let the roots suffer from drought or frost during the operation, and avoid throwing the soil together when it is very wet, or during heavy rain.

WINTER NEALS PEAS TURNING MEALY: *R. C. Lee*, *Sunderland*; *Keddes Kington, E.L.* We should suppose your Peas become mealy and rots because the warmth is greater than it needs. The same falling is noticed in this country when Williams' Bon Christien, Jargonelle, and Louise Bonne de Jersey are planted against walls with a south aspect. The report on the Peas Congress will appear, but at some date at present unknown.

SEEDS.

LONDON: Nov. 17.—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, E.C., report today's market quiet, with a very poor attendance. Rather more attention is now being devoted to red Clover seed, and a further advance in values is noted in France. New English white Clover, red, and Alsike, have begun to be shown, but very little actual business has as yet resulted. There is a better feeling for grass seeds, prices, however, still keep low. The late rise in canary seed is firmly maintained. Rape seed continues remarkably cheap. Rather less money is asked for Hemp seed. Buckwheat is also slightly cheaper. For Blue Beans, there is an improved sale. The new Haricot Beans find favour. There is no change in Linseed.

CORN.

MARK LANE: Nov. 15.—The market was firm, but the tone not so good as on Wednesday last, and the finish extremely quiet. Good English Wheats in perfect condition maintained the advance of 6d. on the rates of this day week, but owing to scarcity there was not much done in them, and inferior sorts met very little attention. Indian Wheats were more in request for mixing purposes, and were fully 6d. dearer, hard Russian and American red descriptions participating occasionally in the improvement. There was a better market for flour, with an advance of 6d. in country marks and American. Fine maling Barley, with a steady demand, was the turn dealer, but second qualities were barely supported. Grinding sorts were quiet at late rates. Oats were 2d. lower for the week, in consequence of heavy arrivals. Beans were 1s. dearer. Maize was rather dearer.

Nov. 17.—There was more disposition to buy English Wheats at the extreme of Monday's rates; foreign tended in the same direction, and Indian sold 3d. dearer. Flour was firm all round. Fine maling Barley was fully as dear; grinding sorts quiet at Monday's quotations. Maize was firm, with more inquiry. Beans and Peas fully supported. Common Oats, of which the bulk of the supply consists, were dull of sale, and barely steady, but good corn firm.

*Average prices of corn for the week ending Nov. 13:—*Wheat, 31s.; Barley, 27s. 6d.; Oats, 17s. For the corresponding period last year:—Wheat, 31s.; Barley, 20s. 1d.; Oats, 15s.

FRUIT AND VEGETABLES.

COLUMBIA (East London): Nov. 17.—Large quantities of vegetables continue to arrive here, the demand for the same being very quiet. Fruit trade brisk, realising good prices. Quotations:—Apples, 3s. to 7s. per bushel; Pears, 4s. to 10s. do.; Brussels Sprouts, 1s. 6d. to 2s. per sieve; Cabbages, 1s. 6d. to 2s. 6d. per tally; Savoy, 1s. to 2s.; Greens, 1s. to 1s. 6d. per dozen bunches; Turnips, 1d. to 2s. 6d. do.; Carrots, 1s. 6d. to 2s. do.; Parsley, 1s. to 1s. 6d. do.; Beetroot, 1s. to 2s. 6d. do.; Celery, 6d. to 1s. per bundle; Onions, 3s. 6d. to 4s. per cwt.; Carrots, 1s. to 2s. per ton; Mangels, 17s. to 18s. 6d. do.

STRAITHEAD: Nov. 16.—There was a good supply of produce, and it was done at the following prices:—Cabbages, 2s. 6d. to 3s. per tally; Savoy, 2s. 6d. to 3s. do.; Cauliflowers, 2s. 6d. to 3s. do.; Turnips, 2s. per dozen bunches; do. 30s. to 40s. do.; Carrots, household, 2s. to 3s. do.; do. cattle feeding, 20s. to 2s. do.; Parsnips, 4s. per score; Mangels, 15s. to 17s. per ton; Sticks, 13s. to 22s. do.; Onions, 70s. do.; Apples, English, 3s. to 3s. 6d. per bushel; Watercress, 6d. per dozen; Beetroot, 1s. do.; Horse Radish, 1s. 6d. per bundle; Celery, 9d. to 1s. 6d. per roll.

POTATOS.

BROUGHAM AND SPITALFIELDS: Nov. 16.—The market was firm and the recent advance well supported for best samples. Quotations:—Kent Regents, 70s. to 85s.; Essex do., 80s. to 90s.; Magnum Bonum, 65s. to 85s.; Early Rose, 60s. to 80s.; and Hebrons, 80s. to 110s. per ton.

COLUMBIA (East London): Nov. 17.—Trade rather languid, at the following quotations:—York and Lincoln Magnums, 55s. to 70s.; Kent Regents, 60s. to 75s.; Essex Regents, 70s. to 85s.; Magnum Bonum, 55s. to 75s.; Cambridgeshire Regents, 60s. to 70s. per ton.

STRAITHEAD: Nov. 16.—Quotations:—High Magnums, 65s. to 80s.; low do., 50s. to 60s.; Beauty of Hebron, 90s. to 100s.; and Champions, 55s. to 65s. per ton.

Imports.—The imports into London last week consisted of 609 bags from Hamburg, 1001 Bremen, 24 Harlingen, 2 Amsterdam, 18 Ostend, 84 Boulogne, 23 Rotterdam, and 1000 bags from Stettin.

HAY.

WHITECHAPEL: Nov. 16.—Supplies were light, but the condition was against the sale in consequence of the rains on the previous day. The market was supported, but the demand was slower than on last market. Quotations:—Clover, prime, 88s. to 100s.; inferior, 70s. to 84s.; Hay, prime, 70s. to 90s.; inferior, 30s. to 65s.; and straw, 27s. to 32s. per load.

Nov. 15.—There was little supply on sale. The trade was dull except for straw, prices for which were firmer.

STRAITHEAD: Nov. 16. Quotations:—Hay, 70s. to 80s.; Clover, 70s. to 90s.; and straw, 28s. to 32s. per load.

PETER LAWSON AND SON (Limited), Edinburgh, having harvested their Crops of JUNIPER, MANGEL, and most kinds of GARDEN SEEDS in fine condition, will gladly furnish Special Offers of the same. Also Samples and Quotations of PERENNIAL and ITALIAN RYE-GRASSES and NATURAL GRASSES — to their Friends: upon application.

HELLEBORUS NIGER, imported,
HELLEBORUS NIGER, for planting, 6s. per doz. from
LILIAM ACRATUM, from Japan, 2 inches across, 20s. per doz. from
LONGIFLORUM, from Japan, 6s. per 100s. from
WATKINS and SIMPSON, Seed and Bulb Merchants, Exeter Street, Strand, London, W.C.

MANDARINS, GARDEN STRAW, VIRGIN CORN, TOBACCO CLOTH, RUSSIA MATS, &c. Write for Price LIST.—H. G. SMYTH, F.R.H.S., 21, Goldsmith's Street, Drury Lane (lately called 17A, Coal Yard), W.C.

K E L P — K E L P — K E L P.
This powerful and stimulating Ash, made from the sundried plants of Laminaria digitata and other selected seaweeds, is especially rich in Iodine and Phosphoric Acid. Mixed with three times its bulk of dry soil, its effect on Vine Enders, Tomato Plants, and nearly all Pot. Plants, is marked and beneficial, while no better dressing exists for Potatoes, Peas, Seakale, and Celery. It is an excellent Renovator for Old Garden Soil, and exhausted and Moss-grown Lawns. Price (per cask with order only) 2s. per bushel bag. Eng. included. Cheap through rates 21d. Southampton or Weymouth.
J. E. FERREY, La Foudrerie, St. Martin's, Jersey.
N.B.—As the Seaweed for the Kelp is now to be harvested during the spring tides of the four summer months, and then at some distance from the mainland, the supply is necessarily limited, and Orders will therefore be executed in strict rotation.

PEAT and SAND.—Light Brown PEAT for Nursery and Greenhouse Work, in four ton trucks of 10 yards each, at 10s. per yard. In bags, at 2s. 6d. per bag. Roadrunner and American Plant Beds, at 15s. per ton. Orchard Peat 5s. per bag; Fresh SPHAGNUM, 10s. 6d. per bag. SILVER SAND, coarse or fine, 11s. per ton.
WALKER and CO., Farnboro' Station, Hants.

BEESON'S MANURE is the best for all Horticultural Purposes. Sold in tins, 12s., 2s. 6d., 5s., 6d., and 10s. 6d., or cwt. bags, sealed, 15s. each. By all Nurserymen or Seedsmen, or direct from Garbroke, Boze Mills, Sheffield. Also pure CRUSHED UNBOILED BONES, any size, and guaranteed of the best quality.

GARDEN REQUISITES.
TWO PRIZE MEDALS.
Quality, THE BEST in the Market. (All sacks included.)

BAYLISS, JONES & BAYLISS, WOLVERHAMPTON, and 139 and 141, Cannon Street, London, E.C. Oil Paint no Longer Necessary. HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully testified by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 2s. 6d. per gallon, at the Manufactory, or 1s. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALFRED LOWE, Esq., *The Ryecroft, Alderley Lodge.* "Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION—Hill & Smith would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE on Fenagh, Hurdles, Field and Entrance Gates, &c., sent free on application to—

HILL & SMITH, Briery Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 116, Stephen's Green, Dublin.

SMITH'S-COLCHESTER LIVE-LONG CANDY, THE BEST DIGESTIBLE.

No household should be without this valuable article. It is highly spoken of by the great Duke of Wellington, to whom it was presented after a mealian effectual Cure. A T Y P E A G A I N S T I N T E R C O N S T I T U T I O N. Heaviness or Burning at the Chest and Fullness after Meals; or, taken at bedtime, by its warm-giving and Stomachic properties. PROMOTES SLEEP. A small piece dissolved in the mouth when exposed to damp and cold, WARMS the CHEST, and prevents those injuries which arise from Chills. It is invaluable to all SICKLY MEN, and is recommended by the Duchess of Beaufort, the Marquis of Waterford, &c. Price, 1s. 1/2d., 2s. 9d., and 4s. 6d.; of all Chemists. Be careful to buy only SMITH'S-COLCHESTER LIVE-LONG CANDY, PREPARED BY JAMES SHENSTONE (late Smith & Shenstone), CHEMIST, COLCHESTER, as, in consequence of its popularity, and the commonness of the name (Smith's) imitations are rife. For post, 1d., 2d., and 5s. or 6s. sample, free.

THE GREAT DUKE OF WELLINGTON RECOMMENDING SMITH'S COLCHESTER LIVE-LONG CANDY AT HIS CLUB.

New and Greatly Enlarged Edition.

THE FORESTER: A Practical Treatise on the Planting, Rearing, and General Management of Forest Trees. By JAMES BROWN, LL.D. Inspector of, and Reporter on Woods and Forests, Benmore House, Fort Eglin, Ontario; assisted by his Son, J. BROWN, Forester, Camdoun, Newton-Stewart. Fifth Edition. Enlarged and Improved. Royal 8vo, with nearly 200 Engravings on Wood, 36s.

It is an authoritative guide, and a reference book which no forester should be without. "Our one standard work on forest management. . . . We have here all that any one can desire, either as history of forest trees, their life history, or their practical management." — *Morning Post.*

"He has condensed a perfect encyclopaedia of everything relating to woodcraft as now understood and practised in every part of the civilized world. . . . He does all that printed instructions can do to supply the place of a regular school training in forestry." — *Full Mill Gazette.*

"As a practical text book for the young forester, the work is invaluable, and no intelligent young man following the profession ought to rest satisfied until he is in possession of a copy, and has carefully studied it in its details." — *Journal of Forestry.*

New and Cheaper Edition.

THE LARCH: A Practical Treatise on its Culture and General Management. By CHRISTOPHER YOUNG MICHIE. With an Introductory Chapter on the Larch Disease. Crown 8vo, 2s.

"Within its pages the planter will find more information upon the best modes of treatment and culture of the Larch-tree, whether in the nursery or in the plantation, than in any other book extant in the English language." — *Journal of Forestry.*

"The work is a most valuable addition to our standard literature on arboriculture." — *Scott's Forester.*

New and Cheaper Edition.

A BOOK ABOUT ROSES: How to Grow and Show Them. By the Rev. Canon HOLDS. Ninth Edition. Revised, fcap 8vo, 3s. 6d.

"His work may now be considered the most complete guide to this interesting branch of horticulture." — *Saturday Review.*

"At once charming and instructive. . . . The practical questions of position, soil, manure, and selection are carefully and exhaustively treated." — *Standard.*

"It is the production of a man who boasts of thirty 'all England' cups, whose roses are always looked for anxiously at the shows, who took the lion's share in originating the 'Rose show' par excellence, whose assistance as judge of *amicus curie* is always courted at such exhibitions. Such a man 'ought to have some roses in his garden, and to give them to the Rose,' and he has said it." — *Gardeners' Chronicle.*

WILLIAM BLACKWOOD AND SONS, Edinburgh and London.

ZADKIEL'S ALMANAC for 1887. Circulation over 140,000. Zadkiel foretold the Earthquakes in America, the War in our Islands, the Revolution in Russia, London; COUSINS AND CO., 6, Helnet Court, (338) Strand, London, W.C. Price 6d.

Preference given to one who has Managed a Florist's Business. State experience, age, and wages expected to TURNER BROS., Florists, 2, Parker Street, Liverpool.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish Repeated.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter.—Enquiries should be made to 237 and 238, High Holborn, W.C.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Under Gardeners, Bailiffs, &c. WM. CUTBUSH AND SON have at the present time upon their List Men whose characters will bear strict investigation, and such as from their personal knowledge can recommend as to abilities, &c.—Ladies and Gentlemen requiring either of the above may apply to our first-class men by applying to Win. Cutbush & Son, Highgate Nurseries, London, N.

Gardeners. THOMAS KENNEDY AND CO. have on their Register a number of first-class GARDENERS, FORESTERS, &c., wishing engagement, and will be glad to refer to any of them by name.—THOMAS KENNEDY AND CO., 108, High Street, Dumfries, N.B.

SCOTCH GARDENERS. S.—John Downie, Secretary, 144, Prince Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

To Gentlemen and Growers MANAGER, where Choice Fruit, Cut Flowers, &c., are required to be Grown extensively for market.—Advertiser, thoroughly experienced, is open to engagement as above.—G. H., 1, Athelstan Road, Harold Hill, Romford.

GARDENER (HEAD), age 32.—Mr. LEACH, Head Gardener, Albany Park, Guildford, can highly recommend a thorough first-class Gardener.—Address as above.

GARDENER (HEAD).—Married; for the last two years Gardener to Lady Percott, satisfactory reason for leaving. Good character.—J. DOWNER, 49, North Road, Highgate, N.

GARDENER (HEAD).—Good Grower of Choice Fruit, Flowers, and Vegetables, also Early and Late Forcing. Good character for ability, sobriety, and industry.—5, Colnbrook Place, Twickenham.

GARDENER (HEAD).—Age 38, married, no family; good all round Man in every branch. Highly recommended.—GEORGE MORRIS, Chapel Square, Kimbolton, Notts.

GARDENER (HEAD), where four or more are kept.—Age 48; well up in all branches of Gardening. For many years Head Gardener to the late G. R. Smith, Esq., Coley Hatch.—J. PULLING, White House, C. Incey Hatch, Middlesex.

GARDENER (HEAD); age 29.—R. HUBBARD, The Gardens, Rushon Hall, Kettering, is at liberty to engage with any Lady or Gentleman requiring a thoroughly practical man.—Eight years' experience in large establishments. Good references.

GARDENER (HEAD).—Age 30, married; seventeen years' experience. Six years' good character from present situation. Leaving through reducing establishment.—J. ELWORTHY, The Gardens, Stampton Hall, Rutland, York.

GARDENER (HEAD); age 28.—Mr. J. WILLIAMS, Gardener to the Baroness Burdett Courts, Holly Lodge, Highgate, N., can very highly recommend the Advertiser to any Lady, Nobleman, or Gentleman as a thoroughly practical man. Good testimonials from other large places.—Please apply as above; or to F. W. RUSSELL, Clayton Villa, Hastings Road, Ealing, W.

GARDENER (HEAD WORKING).—Age 42; twenty years' experience in Vines, Cucumbers, Melons, Kitchen and Flower Garden.—W. P., 11, Alpha Place, West Kilburn, N.W.

GARDENER (HEAD WORKING).—£5 bonus to anyone who procures advertiser a comfortable situation in the country. Thoroughly experienced. Highest testimonials.—H. G., Upper Park Road, Hampstead, London.

GARDENER (HEAD WORKING).—Age 38, twenty six years, no family; sixteen years' previous character, well versed in all branches, including Meadow Land. Well experienced in alterations and Management of Man.—G. MARSHALL, Hoyle Farm, Dorking.

GARDENER (HEAD WORKING).—Age 35, single; good experience in all branches of Gardening. Seven years' character from late employer. Cause of leaving the establishment at Ferry Hill, Sittingbourne, being broken up.—J. BUTT, 102, Subbington Street, Oakley Square, N.W.

GARDENER; age 27, married, no family.—F. KELLEWAY can be recommended by his employer as to personal character and ability.—WM. WATSON, 3, Chiswick Lodge, Devonshire Road, Chiswick.

GARDENER, Scotch; age 40.—EDWARD GEORGE, for the last six and a half years Gardener to J. W. Board, Esq., M.P., Ockendon, Cuckfield, Sussex, and previously for eleven years Gardener to the Earl of Clancarty at Garbhly, seeks another engagement owing to his late employer leaving Ockendon, through the expiration of the lease, and has great experience all branches of Gardening, and has been especially successful in the profitable Culture of Fruits under Glass. Reference kindly permitted to J. W. Board, Esq., 14, Berkeley Square, W.—21, Stamford Road, Fulham, S.W.

GARDENER (where help is given, or SINGLE HANDED), age 22.—Mr. A. FRENCH, Head Gardener to E. Hubert, Esq., Ashby St. Legers Lodge, Rugby, can with confidence recommend a young man as above.

GARDENER (UNDER).—Age 20; good reference from Lord Haldon's Gardens. Can be seen in London if desired.—WM. BUZZACOTT, Kenford, Exeter.

FOREMAN, in the Houses, or good General.—Age 27; eleven and a half years' experience in all branches. Good references.—J. ROGERS, Backhouse's Nurseries, York.

FOREMAN, in a good establishment.—Age 28; first-class testimonials from present and previous places. Fifteen years' good practical experience.—J. HEWITT, Dunstall Hall, Burton-on-Trent.

FOREMAN, age 26.—Mr. BIRCH, Gardener to Sir W. Edey, Bart., Windlesstone Hill, Ferry Hill, Durham, can with confidence recommend a man as above.—Address as above or S. HARRISON, Stone House, Scoulds, Wolverhampton.

FOREMAN.—A. GIBSON, Gardener to T. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, Kent, will be pleased to recommend Robert Johnstone, as Foreman. He has lived on this estate as Foreman for the last three years, and is well up in Fruit and Flower Culture, and is a thorough good workman.

FOREMAN.—Advertiser having resigned his position with Messrs. F. & A. Dickson & Sons as Foreman of the Conifer, Evergreen, and Hardy Deciduous Shrubs, &c., after five years' experience, is open to engage with any one requiring his services in a like position. Good practical experience, inside and out, in London and Provincial Nurseries. An untaken record of capability, and the most satisfactory references.—J. H. GIBBS, 27, Walker Street, Flookersbrook, Chester.

FOREMAN (WORKING), or SALESMAN, in a Nursery.—Can take charge. Well up in every branch of Nursery-work. Five years in last place. Left through death of employer.—L. G., 10, Acknam Road, Parson's Green, S.W.

FOREMAN, or PROPAGATOR.—Age 25; ten years' experience in the general run of Market Stuff, Pelargoniums, Bourdains, Ferns, Solanums, Primulas, Cut Flowers, &c. Good Salesman.—J. LAMBERT, 1, Bailey's Lane, Stamford Hill, London, N.

To Nurserymen. FOREMAN PROPAGATOR or GROWER.—Good experience in the Cultivation of Plants.—W. R., Longland's Nursery, Sidcup.

PROPAGATOR and GROWER.—Age 26, married; well up in Softwooded Foliage, Ferns, &c. Eleven years' experience. E. W., 5, Lordship Cottages, Lordship Road, Stoke Newington, N.

JOURNEYMAN (FIRST), in the Houses.—Age 22, single; good practical experience. Good references.—GEORGE BARKER, The Nurseries, York.

JOURNEYMAN (FIRST), in a good establishment.—Age 24; nine years' experience.—Two years in last situation.—G. TILLEY, Thorney, near Peterborough, Cambs.

JOURNEYMAN (FIRST), Indoors, in a good establishment; age 22.—Mr. C. MARSHALL would be pleased to recommend the above to any Gardener requiring a steady young man.—C. MARSHALL, Arbury Gardens, Nuneaton, Warwickshire.

JOURNEYMAN (FIRST, or SECOND), in the houses, in a good establishment.—Age 21; seven years' practice under Glass. First-class testimonials.—F. LANGRIDGE, Whitebone Lodge, Crawley, Sussex.

JOURNEYMAN.—J. HEDDEN, Hutton Hall, York, can with confidence recommend two young men as above, in a good establishment. Both preferred.

TO NURSERYMEN and GARDENERS.—Wanted, a situation in a Nursery or Gentleman's Garden, in the Houses.—Age 18; three years' experience. Good character from last situation.—T. KEMP, Fern Doan Nurseries, Wimborne, Dorset.

TO THE NURSERY TRADE, &c.—Situation wanted by a young man who is quick at Potting and Tying. Five years in the Market Trade. Good character from last employer.—W. O., 10, Williams' Terrace, Welles, Kent.

TO NURSERYMEN and SEEDSMEN.—Advertiser, who has a thorough knowledge of both Land and Provincial Seed and Nursery business, and is a first-rate Propagator, requires an engagement.—Round House, Newmarket Road, Cambridge.

COWMAN, assist in garden on a Gentleman's Estate.—Married; good Poultryman. Four and a half years' reference from present employer.—W. COLLYER, Dennis Road, East Molesey.

CLERK, SHOPMAN, or TRAVELLER.—Age 26; ten years' experience. Thoroughly conversant with all branches of the Trade. First-class references from past and present employers.—G. H., James Meredith, Seedman, Golden Square, Warington.

Nursery and Seed Trade. SHOPMAN and BOOK-KEEPER, CORRESPONDENT, or TRAVELLER.—Age 23; thorough knowledge of the combining Trade, and both in and out. Good Shortland and French. Highest references.—E. C. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN.—Experienced in all branches, and Knowledge of Book-keeping. Abstainer.—H. P., Gardeners' Chronicle Office, 41, Wellington Street, Strand, London, W.C.

Seed Trade. SHOPMAN, or ASSISTANT.—Age 25; nine years' experience; all departments. Presently first class hand in a Scotch house. First-class references.—D. C. FLETCHER, 112, Eglinton Street, Glasgow.

SEED TRADE.—Young man; seven years' experience in the Office of a large House. Conversant with Agricultural Seeds. Good Correspondent and Shorthand Writer.—E. M., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—Health or Wealth.—No sane person would hesitate an instant in the choice between these two conditions. Now is the season to secure the former either by the use of Holloway's Pills, or by the use of the latter. Pills expel all impurities from the system, which fogs, foul vapours, and variable temperatures engender during winter; the medicine also acts directly upon the skin by discharging the liver of its accumulated bile, and by exciting the kidneys to more energetic action; it increases the appetite for food and strengthens the digestive process. The stomach and liver, with which most disorders originate, are fully under the control of these regenerative Pills, which act very kindly yet more efficiently on the tenderest bowels.

Extract from the "Lady's Pictorial" of 23d Oct., 1886.

"Most of our readers are already familiar with the beauty and merit of the **Darlington Dress Fabrics** Manufactured by Messrs. **HENRY PEASE & Co.'s** Successors, at the Mills, **Darlington.**

"The Novel Patterns and Designs especially prepared for the present season are exceptionally successful, both as regards colour and texture, and we can thoroughly recommend these goods to the notice of our readers as being entirely suitable for autumn and winter wear. Large Boxes of Patterns will be sent immediately upon application at the above address, and the novelty and beauty of the fabrics will quickly con-

vince our readers that they deserve the highest praise.

"It is impossible to over-estimate the immense advantages of obtaining goods in this manner direct from the original manufacturers, since there remains literally only one man, and therefore only one profit, between the wool-producing animal and the person who eventually wears the woollen goods. Where there is only one profit to be made, as in this case, it is clearly evident that the purchaser must benefit largely, since there is no middle man to swallow up the intermediate gains. This being so, our readers will do well to make the most of their opportunity, and write at once for Patterns, which are naturally greatly in demand at the present season of the year.

'We must mention as specially appropriate just now the Darlington Cross-warp Serges, the all-wool *foules*, and the Gold Medal Cashmeres, for these materials, together with all the other Darlington Dress Fabrics, are fine and soft in texture, artistic in colouring, and entirely novel in design."

HENRY PEASE & CO.'S SUCCESSORS, DARLINGTON. [Established in 1752.]

All Parcels are Carriage Paid, and any Article can be Changed within Seven Days.

"THE CAMBRICS OF ROBINSON & CLEAVER HAVE A WORLD-WIDE FAME." THE QUEEN. **CAMBRIC**

NARCISSUS MONOPHYLLUS, or BULBOCIDIUM ALBUS, or CLUSII, the White Hoop Petticoat Narcissus. The undersigned are expecting a new introduction of very fine bulbs of this nice bulbous plant, fit for immediate planting and for flowering this winter within a short period. Only immediate Orders can be attended to, as the stock got sold within ten days, is planted. Cash price, per 100, 12s. 6d.; per 250, 30s.; per 500, 55s.; per 1000, 100s. Discount to the Trade.

E. H. KRELAG and SON, Haarlem, Holland.

THE BEST NEW CULINARY

PEAS for 1887 are: "ECKFORD'S 'MAGNIFICENT,'" "ECKFORD'S 'VICTOR,'" "ECKFORD'S 'DIGNITY.'" In sealed packets only. For particulars view *Gardeners' Chronicle*, October 30, page 550. Descriptive LIST on application. Now being sent out by WILLIAM BULL, ELSA, Establishment for New and Rare Plants and Seeds, 356, King's Road, Chelsea, London, S.W.

Sweet-Scented Rhododendrons. ISAAC DAVIS and SON have this season a fine stock of the above, mostly well filled with flower-buds, at 2s. 6d. to 3s. 6d. each.

The same varieties require no special treatment, but care should be taken not to give them too much fire-heat. We are informed that in South Wales they have withstood the severest weather in the open ground unharmed; but it is well to give the protection of glass to bring the flowers to perfection. Descriptive CATALOGUE on application. Grem-kark, Lancaster-bire.

YEW S, 3/4 to 4/4 feet, 8/4s. per 100. HOLLIES, green, 2 to 3/2 feet, 6/4s. per 100; 3 to 3/2 feet, 5/4s. LAURELS, Portugal, 2 to 2 1/2 feet, 50s. per 100. [per 100] AUCURAS, 2 to 2 1/2 feet, bulvy, 18s. per dozen.

HOLLIES, variegated, 2 to 3 feet, 13s. per dozen. QUICK, strong, 14s. per 100.

Some prime specimen YEWs, good, 3 to 3 1/2 feet, 2s. 6d. each; also some larger ones up to 12 feet.

JOSEPH SPOONER, Goldworth, Woking Station.

NEW PEA for 1886.

LAXTON'S WALTON HERO.

First-class Certificate from the Royal Horticultural Society after Trial at Chiswick.

T. LAXTON is prepared to SELL the WHOLE STOCK of this fine, large, and handsome podded NEW PEA, raised from a cross of Telephone by British Queen, and which is of the highest quality and fertility—to produce this season from 5 pecks, grown on about 2 rods of ground, under ordinary field culture, being 35 bushels, and the grower says he considers it far superior in quality to York-shire Hero.

If the Stock be not sold, "Walton Hero" will be sent out in Sealed Half-pint Packets, at 2s. retail, with liberal allowance to the Trade.

For further Particulars apply to T. LAXTON, Seed Grower, BEDFORD.

T. L. has disposed of that fine new Pea "Charmar," sent out last season, together with his new First Early variety, "Primum," and "Sensation" and "Amcor," two fine new Peas Certificated by the Royal Horticultural Society to Messrs. HARRISON and SONS, Seed Merchants, Leicester.

Notice.

King's Acre Nurseries, Hereford (Established 1785). JOHN CRANSTON begs to announce that, having PURCHASED THE BUSINESS, together with the most valuable portion of the stock, from "The Nursery & Seed Company (Limited)" their Old-established Nurseries will, on and after NOVEMBER 27, 1886, be carried on by him under the name of "JOHN CRANSTON and CO."

King's Acre, Hereford.—October 1, 1886.

FRIDAY NEXT.

ANGRÆCUM SCOTTIANUM.

The most remarkable Importation ever seen.

MESSRS. PROTHEROE AND MORRIS are instructed by
Mr. F. SANDER to SELL by AUCTION, at their Central Sale Rooms, 67 and 68,
Cheapside, E.C., on FRIDAY NEXT, December 3, at half-past 12 o'clock precisely, the
grandest lot ever introduced of the extremely rare ANGRÆCUM SCOTTIANUM. The plants
are in most superb condition and in extraordinary masses, nothing approaching them having ever
been seen. This Angræcum is not only one of the rarest extant, but also one of the most beautiful.
Its pure white flowers are round and compact, nearly 3 inches across. The spur measures some
6 inches, and is of a lighthouse red. It is figured in the *Gardeners' Chronicle*, July 31, 1880, p. 136.

There will also be included in the above Sale ANGRÆCUM LEONII, in grand pieces;
ONCIDIUM MACRANTHUM, the rare and beautiful ONCIDIUM UNDULATUM,
ODONTOGLOSSUM PARDINUM, O. HALLII LEUCOGLOSSUM, a fine lot of CAT-
TLEYA PERCIVALIANA, ONCIDIUM NUBIGENUM, in large masses; ODONTOGLOS-
SUM EDWARDII, &c.

On view morning of Sale, and Catalogues had.

NOW READY.

THE GARDEN ANNUAL ALMANAC and ADDRESS BOOK for 1887.

This is the most complete and accurate Yearly Reference Book for the use of all interested in
Gardens yet published. The Alphabetical Lists of all Branches of the Horticultural Trade have
been corrected up to the end of October. The Lists of Gardens and Country Seats have been
very carefully and extensively revised, and are admitted to be the most complete ever published.

The "Garden Annual" may be ordered through all Booksellers, Nurserymen, and Seedsmen.

PRICE, ONE SHILLING; POST-FREE, ONE SHILLING AND THREEPENOE.

tion invited. Freeed Catalogues free.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 27, 1886.

AUSTRALIAN AND NEW ZEALAND TREES IN ARRAN.*

THE island of Arran is the most northern locality where Australian and New Zealand trees and shrubs have been extensively cultivated. The success which has attended the experiment has attracted much notice. Baron Mueller in his most valuable work on the *Eucalypts of Australia*, and also in his *Select Extra-Tropical Plants*, makes constant reference to them. This has led the writer to give this year a much more detailed account than would otherwise be desirable.

Arran, situated between 55° to 55° 30' N. latitude, 20 miles in length by 8 or 10 miles in breadth, is one of the Inner Hebrides, and lies at the mouth of the Clyde. The northern half is mountainous, ascending to the height of 2866 feet; the southern half is much more level, ascending to only half the height of the northern. The rainfall varies much, but everywhere it is great; at Lamlash it averages 66 inches. There is, however, little mist or fog along the coast, where all the trees are planted; and there are few days some part of which is not dry. The temperature in winter is much higher than on the mainland. On the light-house at Pladda, half a mile south of Arran, at the height of 110 feet, the lowest temperature for thirty years was in January, 1851, when it sunk to 25° F. The temperature is moderated by its insular position, by the Gulf Stream, and by the fact that channels of deep water (averaging about 450 feet in depth) run lengthways near to the shore along both sides of Arran.

Many of the trees mentioned grow in the garden of Captain Brown at Lamlash. His house is in the middle of the Bay of Lamlash. The bay is 3 miles in length and is protected by the Holy Isle, lying in the centre of the bay, at 138 miles from the shore and 1030 feet in height; while the mountains behind Lamlash also ascend to the height of 1003 feet. The trees are planted in a good soil, abounding in water-springs on the slope of the old coast line, and about 200 yards from high-water mark. Trees are also planted at Brodick Castle high garden. This is on a slope about 100 feet above the sea, and is sheltered by wood on all sides; the soil is light and the garden slopes to the sun. Cromla garden, Corrie, is only separated by the highway from the sea at high water; it is also sheltered by trees, while the mountains rise so abruptly behind it and so shelter it from the wind, that though seemingly exposed to the full fury of the east wind, it is in reality so protected that the branches of the trees all incline towards the sea, and at high water some of them actually overhang it. The soil of this garden is stiff clay, thoroughly drained.

* The measurements, unless mentioned, are taken at 3 feet from the ground. When trees are not from Australia or New Zealand this is stated. Rev. P. Landsborough, in Report of Edinburgh Royal Botanic Society, November, 1881.

GUM TREES.

The Alpine Gum (*Eucalyptus alpina*: Victoria).—This is one of the most remarkable of the Gum trees. Its native habitat is the summit of Mount William, the highest peak (3825 feet) of the Grampians of Victoria. Though exalted in position it is the opposite in stature, being "a mere bush 3 or 4 feet high, showing no tendency to form a main stem. Its leaves, broad and rarely above 3 inches in length, are dark green (purple when young); the flowers single, sessile, and much resembling those of the Blue Gum (*E. globulus*), and almost as large." (Mueller.) Baron Mueller was so much interested in what he heard of it that he visited its lofty habitat and took away seed which he sowed in the Botanic Garden of Melbourne. Here it retained much of its original character, and remained so dwarfish that "in a quarter of a century it grew only to the height of 12 feet, and showed no tendency to alter its bushy habit." I am happy to report that, as became a Grampian plant, it has taken most kindly to the original land of the Grampians, and bids fair in Scotland speedily to outrival all its Australian compeers. It was planted in Arran, in 1884, when its height was only 2 feet, now, in 1886, it is 5½, having last year grown 2 feet, that is four times the growth of the one in the Melbourne Botanic Garden. Instead of the leaves being only 3 inches in length, one of them, besides being so thick as to weigh three quarters of an ounce, measured 9 inches in length and 5 inches in breadth. Aligne though its original habitat is, it grows in Corrie Hotel gardens, in a sheltered spot so near to the sea as to be only 35 yards from high-water mark. So very vigorous is its growth, that my friend Mr. Lindsay has doubted its being the genuine alpina, and has given me another plant from the Botanic Gardens that he can certify. Through the kindness of Mr. Murray, factor to the Duke of Hamilton, this one has this year been planted in his garden in light soil and in a sheltered spot open to the sun almost the whole day. Here I doubt not, it will soon equal the one at Corrie. At present it is about a foot in height. The low habit of this Gum tree adapts it for many places for which most of the Gums would be unsuited. Its large and interesting flowers will also be all the better seen.

The Blue Gum (*Eucalyptus globulus*: Victoria and Tasmania).—The size, rapid growth, striking appearance, the property of absorbing more moisture from the soil than any other tree, and thus of rapidly drying marsh-land, the abundance of the anti-malarial perfume that is diffused by its leaves, especially when growing when the leaves are broad and soft, have united to render this the most popular of all the Gum trees. As the leaves also generate ozone largely it is recommended for window culture, and also for the wards of hospitals. "In Australia it attains the height of 350 feet. On the mountains of Guatemala, in Central America, where it has been introduced, it grows so rapidly that in twelve years it has been known to attain a height of 120 feet, with a stem circumference of 9 feet." (Mueller.) Unfortunately it is not so hardy as many of the other Gums. "In South Europe it withstands a temperature of 19° F., but is killed by one of 17° F." At Arran several at various times have been planted, but the severe winter of 1880-81, which destroyed all the Blue Gums in the open air on the mainland of Scotland, killed those in Arran with the exception of one at Captain Brown's, Lamslash. It was sown in 1874 by James Paterson, E. q., factor to the Duke of Hamilton, and is now 40 feet in height and 2 feet ½ inch in girth. It would have been about 8 feet taller had it not been killed to prevent its being blown down by the wind. Its girth would also have been greater had not the winter of 1880-81 destroyed all its leaves, and so injured it that it was more than a year before it fully recovered its former vigour. It is near to the highway, and well seen from it, and as Lamslash is much frequented in summer by visitors, and Lamslash Bay is much resorted to as a harbour of safety, the Blue Gum attracts much attention. At times sailors or foreigners may be seen in the highway looking at it. Then they come up the avenue to have a nearer view, when not un seldom they become demonstrative. Long may it live and flourish!

The Cider Gum (*Eucalyptus Gunnii*: Victoria, Tasmania, and New South Wales).—This Gum receives its name from the juice that flows from it when pierced in spring. When it grows on the plains it differs a good deal from the mountain variety, and is

often called the "Swamp Gum," from the nature of the ground in which it delights. "It grows to a considerable height. Bees obtain much honey from its flowers. Cattle and sheep browse on its foliage." (Mueller.) A special interest attaches to this Gum in Britain from the fact that at Kew it has withstood severe frost [it is injured more or less every winter, but produces new shoots from the old trunk every summer.—ED.] At Whittinghame, East Lothian, there is a tree, planted in 1845, which, though cut to the ground by frost in 1860, is now more than 60 feet in height, and matures seed, which, having been sown by Mr. Lindsay at the Edinburgh Botanic Gardens, has germinated, so that we have now Scottish-bred trees of this species, which may be expected to be even more accommodating to a Scottish climate than their parent. Mr. Stewart informs me that in New Zealand he found that, while sometimes straggling in habit when left to its natural growth, when topped it acquires a weeping habit, and becomes a beautiful tree. It grows vigorously at Captain Brown's, Lamslash. One was planted last year at the Free Church Manse, Whiting Bay, where its power to resist the sea breeze will be tested.

The Coccoloba Gum (*Eucalyptus coccoloba*: Tasmania).—This is one of the Box Gums. The leaves of the plant when young are not unlike in colour, shape, bloom, and substance to Box, only much larger, being about the size of a penny. It is, so far as yet known, the most hardy of all the Gum trees. A plot of it grows in perfection at Captain Brown's, Lamslash; there is another at Clachaig, near Lagg, where its power of resisting the sea breeze will be ascertained. Its flowers are purple. At Powderham Castle, Devonshire, there is a tree, said to be of this species, more than 60 feet in height and 9 in girth. (See figure 18, in *Gard. Chron.*, vol. x., 1879, p. 113.)

The Crimson Gum (*Eucalyptus ficifolia*: South-Eastern Australia).—I have ventured to name this species popularly for this country as "the Crimson Gum," because of its crimson flowers. A few other Gums have crimson flowers, but this is the only one of the crimson bloomers likely to be cultivated in Britain. "Although not a tree of large dimensions, this splendid species is very notable for its magnificent trusses of crimson (filaments cinnamon-red) flowers, and its handsome leaves, which resemble those of the Indian rubber tree (*Ficus elastica*). It is a shady heat-resisting avenue tree, not standing in need of watering, and grows to the height of about 50 feet." (Mueller.) I owe to the kindness of a friend a specimen of this gorgeous Gum. It is now in the greenhouse of another friend, as till I have had the pleasure of seeing it in bloom I will not venture to, even in Arran, to the open air. When planted it must be placed in as warm and sheltered a spot as possible.

(To be continued.)

CHRYSOGONUM VIRGINIANUM.

The recent unusually dry autumn afforded a very good test of the drought-withstanding capabilities of hardy plants in general, and few have passed through the trying ordeal more satisfactorily than the above-named plant, of which the accompanying illustration (fig. 131) shows only one of its numerous flower-heads. It is closely allied to the *Silphiums*, and though long since introduced, is rarely met with in gardens now-a-days. It is an extremely useful plant, especially for the front of mixed borders, or even as edging; and as it cares little for drought, we have found it indispensable for covering bare dry banks, &c. It has the merit, too—an unusual one for a North American plant—of beginning to open its flowers early, and continuing until the severe frosts set in in this year, notably, it has flowered since early summer, and when we saw it the other day it had lost little of its usual vigour. In light sandy soil it seems more floriferous than in that of a heavier nature; in the latter, too, it grows more robust, and loses its creeping character to a large extent. It produces numerous creeping rootstocks, rooting deeply as they travel along, and presenting a ready means of propagation. It rarely exceeds 9 inches in height, bearing three or four pairs of ovate, crenate, long petioled leaves, those on the stem semi-cordate, and surmounted with large heads of clear yellow flowers, each an inch or more in diameter. It is found on dry ground in Pennsylvania, Florida, &c., and is apparently very variable. One of the more distinct forms has been selected by Gray and called *dentatum*; it has deltoid-ovate leaves, more coarsely dentate-serrate, the teeth as well as the tips of the bracts having a more conspicuous mucro. The specimen from which our illustration was taken was sent by the Rev. C. Wolley Dod. D.

New Garden Plants.

NORMODES PARDINIUM MELANOPUS, *nov. var.*

When the varieties *asperum* and *armenicum* came I was puzzled enough. How can I describe my astonishment at the sight of a fine inflorescence loaded with flowers of such a dark brownish-purple tinge that they looked almost black? It is a great satisfaction to me to thank for this novelty Consul Kienast Zolley, of Zurich, one of the most intelligent orchidists of our days. *H. G. Rehb. f.*

PAPPERITZIA LEIBOLDI, *Rehb. f.*

This plant forms, as it becomes older, small dense tufts. There are a few often ascending filiform roots. The depressed pyriform one- or two-leaved bulbs are very small, nearly concealed by the lowermost leaves, and not attaining three-quarters of an inch in length. Leaves strong, cartilaginous, linear, acuminate, cuneate at the base, 2-3 inches long, three lines broad, very thick, with a projecting midnerve beneath, and sharp red borders. The peduncles I had before me were pendulous (½), filiform, 4-5 inches in length. Flowers in lax racemes. Bracts narrow, triangular, shorter than the stalked ovaries. Flowers small, three to five lines long, green with finally yellow bristles on the sepals and petals and some yellow on the lip. Median sepal concave-gibberose, with a tail-like apex equal to the inferior compressed-conical part. Side sepals connate, compressed, with a nearly square back and an aristate apex, arista shorter than the connate sepaline body. Petals oblong aristate-cuminate. Lip connate with the base of the column, forming a blunt pouch at the base, hairy inside and closed in front by a high tridentate lamina. Epibole of various forms, oblong, with basilar auricle, or cuneate, ligulate, blunt acute; with a tumour at its base, reaching to the base of the tridentate lamina. Column compressed, with a protruded rostellum and an androclinium with a blunt not very pronounced border. There is a triangular curved arm on each side the stigmatic hollow at the base of the column. Anther gibbous at the top, long, looking from the side like that of a *Leochilus*, or like an obtusely beaked bird's head. Pollinia globular, hollow inside. Caudicula broad, elliptical, or rhombic, convex at the base, linear at the top, with a small glandule.

This is a description of a plant that might, indeed, better be understood by figures. The plant is one of my oldest friends. Curiously enough, with a certain persistency, it always returns to me, but up to now it has avoided the friendly shore of Old England.

Returning from South Europe in December, 1843, I found at Dresden Mr. Leibold, just returned from Mexico. The first pick of his herbaria had been permitted to some wealthy amateurs, so that I had but a smaller set of those Orchids, which I named and described in the *Linnaea*. Quite accidentally I obtained a bottle, containing some branches with fruits and a queer little Orchid, that had an erect raceme and reddish looking flowers. Not considering it to represent a new genus I named it *Leochilus Leiboldi*, in 1844. In 1852 I proposed a fresh genus, *Papperitzia*, dedicated to a lamented botanical friend of my youth, W. Papperitz, who discovered *Hymenophyllum turbridgeense* in Saxony, in 1858. I gave a figure of it in *Asia Orchidacea*, i. t. 100, with that of *Cohnia*, a genus found again a few weeks ago, and kindly sent by Herr Oberhofgartner Wendland, the greatest practical connoisseur of Palms. I dried my alcohol specimen carefully, to escape the possibility of its accidental destruction. Unique specimens should never be kept in alcohol, and I was exceedingly pleased the other day to see that Professor Oliver has just the same view. Many, many hundreds of Mexican Orchid specimens and scraps passed through my hands, but my beloved Orchid was never seen any more.

I was not aware that I had a rival, or better, an associate in my love for this unique plant. This associate—Herr Kienast Zolley, of Zurich—born in Mexico, and knowing great part of the land as well as he does the covirons of Zurich, kept silence, but sent copies of my drawing to his brown collectors in Mexico. Imagine my surprise when, in November, 1883, this excellent gentleman sent me two dried specimens of the plant. One is quite a dwarf, the other has a kind of a panicle, there

being a side branch to the raceme. Both inflorescences are upright, the flowers yellow. A living plant, sent also, had a raceme, but it did not develop, neither did the plant make good progress.

In July of this year came a glorious living plant with two rich and one poor pendulous inflorescence. The same plants growing wild have the inflorescences upright. The purple colour of my first specimen may have been developed in the spirit, perhaps from the fruits.

The genus is as it were a connecting link between *Oraithocephalus* and *Rodriguezia*. It answers rather well the incorrect diagnosis of *Zygostates*, but it has really two pollinia. A new species might show some new unexpected affinity.

My life has been very rich in orchidic pleasure. I may, however, state that I have seldom experienced

form a broad, wide body nearly as long as the lip, veined on the same plan. Petals spreading, ligulate, acute, ciliate on the borders, with seven dark purple nerves, the three looking towards the side sepals, green at the base, all covered with much darker purple spots. Lip nearly that of *Cypripedium barbatum*, very fine dark purple, full of dark warts on the involved side lacinia, pallid underneath towards the base. Staminode transverse, with one tooth each side, and a small one in mid.

This fine novelty is the *Sedenian opus* n. ? It was kindly sent me by Mr. Harry Veitch, at whose request it is dedicated to Mr. F. G. Tautz, Studley House, Goldhawk Road, Shepherd's Bush, London, S.W. It is with the greatest pleasure that I give it this name, since I know very well the uncommon enthusiasm for, and love of, Orchids that has suddenly

benefactor is Mr. Tautz, Studley House, Goldhawk Road, London, W. The lovely flowers are quite surprising in their uncommon colour, white with transverse purple bars, and in their very long petals and triangular lip. They resemble certain moths. The plant furnishes one of those difficulties which give so much work to the botanist, although the amateur knows nothing about them. The lip, when dried, becomes so very narrow, that no one would recognise the fresh plant from dried specimens. In the present instance, however, we have been fortunate, inasmuch as the living plant was known first, and the habit of its flowers could be well watched from the first. A representation of the species has been given in *Lindenia*, I., xxvii. *H. G. Rehb. f.*

NERINE MOOREI, n. sp.

Leaves 9—12 inches long, half to three-quarters of an inch broad, very curved, slightly twisted, broadest about one-third of the length from the base, blunt-pointed, thick and leathery in substance, bright shining green, as if polished, on both surfaces, nerves not, or scarcely visible; leaves little behind the flowers; peduncle short and stout, compressed, dark brownish-green, 8 inches long; flowers centripetal, six to nine in number; pedicels thin but stout, three-quarters to 1 inch long; spathe valves lanceolate, red, longer than the pedicels; ovary globose trigonous, one-eighth of an inch in diameter; perianth erect, of the deepest and brightest imaginable scarlet; segments cut down to the ovary, oblanceolate, crisped, nearly quarter of an inch broad, 1½ inch long; filaments erect, of the same colour as the flowers, longer than the perianth segments; anthers oblong; one-sixth inch long, style straight, 1½ inch long.

This very beautiful plant is at once distinguished by its thick, leathery shining leaves, its compact constitution, and the very wavy, or rather crisp flower segments, and by the very brilliant colour of the perianth. I have named it in honour of the able Curator of the Royal Botanic Gardens, Dublin, Mr. F. W. Moore, to whom I am indebted for the bulb. *Max Leichtlin, Baden-Baden.*

LASTREA LEPIDA, n. sp.

Fronds ovate acuminate, a few of the lower pinnae abbreviated, herbaceous in texture, pinnato-pinnatifid; pinnae distinct, mostly alternate, very shortly stalked, the upper ones almost sessile, the longer central ones 3½ inches long, the lower four or five pairs shorter, the lowest being 1½ inch long, narrowly lanceolate, broadest in the centre (about a quarter of an inch), attenuately acuminate at the apex, and much contracted at the base except the lowest pair of lobes, which are about one-fourth of an inch long, and lie parallel to the rachis; divided two-thirds down into narrow linear-oblong blunt falcate ascending lobes, which are decurrent behind, glabrous except on the costa, which is hairy above, and on the margins, which are sparingly setose; veins simply pinnate, four or five on each side, very short, except the lower anterior one of each lobe, which extends to the sinus and terminates in a few slender setose hairs; sori medial, on each side and very near to the midrib, covered by inflated roundish-reniform lead-coloured hairy indusia; caudex erect; stipes furnished with a few pale brown lanceolate scales while young, and as well as the main rachis green, furrowed in front, rounded behind, and freely setose on the margins.

This remarkably elegant evergreen *Aspidiaceus* Fern has sprung up without a history in the tropical fernery of Messrs. E. G. Henderson & Son, at the Pine-apple Nursery, Malda Vale. It comes near the Fijian *Lastrea Prenticii*, as pointed out to us by Mr. Baker, but does not quite fit in with the peculiar features of that species as indicated by Mr. Carruthers, its original describer in the *Flora Vitensis*, and by Mr. Baker in the *Synopsis Filicum*. *Lastrea Prenticii* is said to have rhomboid fronds, sessile pinnae, basal pinnules of considerable length, close-set pinnules, and small involucre—characteristics which are not found in the specimens we have seen of *Lastrea lepidia*, which latter, moreover, has the basal pair of pinnales of full length but narrow. These basal pinnules, extending as they do, parallel to the main rachis, in consequence of the very narrow lance-shaped pinnae decreasing in width to their base, suggest the idea of resemblance to the guard of a small dagger. The veins are also much fewer in our plant, in which, instead of nine or ten pairs in each pinnae or lobe, there are four or five only in the very largest lobes. Whether it has found its way into our

FIG. 131.—CHRYSOZONUM VIRGINIANUM: DWARF HARDY PERENNIAL: FLOWERS YELLOW. (SEE P. 680.)

such delight as when my good little plant, the first orchidic curiosity that fell into my hands, reappeared after forty years, not accidentally, but in consequence of the persevering zeal of so distinguished an amateur as Consul Kienast Zölley. *H. G. Rehb. f.*

CYPRIPEDIUM TAUTZIANUM, n. hybr. art. ex Hort. Veitch.

This is stated to be a mule between *Cypripedium niveum* and *C. barbatum*, to have the dwarf habit and manner of growth of the first; leaves unknown to me; and a two-flowered inflorescence. The flowers are very nice indeed, and are much like those of *Cypripedium tessellatum* porphyreum. The colours, however, are much more brilliant. The elliptical, acute, median sepal is white, with very dark purple veins, some of which have veinlets radiating outside, which look remarkably neat. There are two green veins on each side of the midrib. The connate lateral sepals

given Mr. F. G. Tautz the reputation of being one of our most zealous Orchidists. *H. G. Rehb. f.*

CATLEYA GRANULOSA (Lindl.) ASPERATA, nov. var.

A fine *Cattleya granulosa* with brownish sepals and petals, spotted with dark purple. Lip yellowish at the base, anterior part of the finest light vivid purple with a broad white border, which looks remarkably fine. The anterior surface is rough in an extraordinary manner. It was kindly sent me by Major Lendy, in August last. *H. G. Rehb. f.*

CATASETUM TIGRINUM, Rehb. f. (*Gard. Chron.*, 1881, p. 40, Jan. 8).

I was exceedingly pleased to receive a very fine inflorescence with twelve well developed flowers. I had previously seen only a single flower, and at another time a single inflorescence. My present

gardens amongst imported Orchids it is not possible to say, there being no information on the subject; but this surmise has perhaps more probability attached to it than the supposition that it is a mere garden sport, which is indeed all the less likely inasmuch as there is no cultivated Fern which at all closely resembles it. In any case it is as graceful in aspect as it is novel in character, so that it must become popular.

As known to us, the plant produces fronds of about 1½ foot in stature from a short erect caudex, the fronds being erectly arching in their mode of growth, of a tender herbaceous texture, and of a light bright green colour. They are nearly glabrous, a row of close-set setose hairs being found on the edges of the main rachis, and a few in the sinuses of the lobes, while the upper surface of the costa or secondary rachides is covered with shorter hairs of a denser character. The fronds are pinnate, and the pinnæ pinnatifid, a style of division which we think most clearly expressed by the compound term pinnato-pinnatifid; these pinnæ are more or less horizontally spreading, those on the upper part of the frond especially so, and they stand about half an inch apart, or rather closer upwards; they are of a very elegant narrow lance-shaped figure, pinnatifid throughout, but with the lobes towards both the base and apex very much reduced so that the base assumes a cuneate outline, and the apex is much acuminate; the lobes are narrow and falcate, with the posterior base decurrent, and at the base next the main rachis occur the two straight narrow longer lobes already alluded to. The greatest width in the central part of the pinna is about one-fourth of an inch; the greatest length is about 3½ inches, and the length of the lowest abbreviated pinnæ 1½ inch. The venation is but little developed, owing to the small size of the lobes, and consists of three or four pairs of short simple veins, bearing the sori near their base, close to the mid-vein, the lowest anterior vein, which bears a medial sori, being elongated so as to reach the sinus, where it terminates in the few setose hairs already mentioned. These sori are abundant over the frond, but scarcely crowded; they are punctiform, and covered by somewhat puffed-out lead-coloured hairy indusia, which are large for the size of the plant, and change to a whitish-brown colour when dry.

We owe our knowledge of this handsome plant to the Messrs. E. G. Henderson & Son, of the Pineapple Nursery, who, we understand, have ascertained that it may be obtained without variation from the spores. It is a hothouse Fern of especial merit. *T. Moore, Chelsea.*

EFFECTS OF TOBACCO ON LAND.

THERE may be great profits in growing Tobacco (for a while), but I do not think we can keep it up long unless we are willing to spend a good share of the proceeds of sales in the purchase of manure and fertilisers to keep the yield up.

So far as my observation and experience goes, I find Tobacco very exhausting to the soil. A heavy coat of manure is needed for every crop, and that is something that can hardly be said of any other farm product. We often read and hear it said that any soil that will grow a good fair crop of corn is all right for Tobacco. I do not find this to be the case. A very good crop of corn can be grown where Tobacco would be a comparative failure. Not only does the crop require an immense amount of fertilising material, but it seems to have a bad effect on the land for succeeding crops. As "Uncle Jotham Sparrowgrass" used to say through "Tim Eanker's" papers, "it seems to pizen the land."

One of my neighbours raised last year an acre of Tobacco, putting on the land after it was ploughed a very heavy coat of fine manure, hauled at considerable expense from a neighbouring village. This was cultivated and dragged in thoroughly, so that there could have been no loss to speak of from evaporation or washing. That acre is the corner of a field which he has planted this year to corn—last year's Tobacco land and all. He told me several times that he expected a big crop of corn on that acre. I have seen the field almost daily during the season, and if anything, the acre corner is under the average of the field, notwithstanding it received so heavy a coat of manure while the balance of the field received none.

It hardly seems possible that the one crop of Tobacco could have absorbed the manure applied.

Until I find a more scientific and satisfactory explanation, I must fall in with "Uncle Jotham" when he says "it pizen the land." Unless the farmer makes a speciality of it, and buys manures constantly to keep his land up, I think the less he has to do with Tobacco the better off will his land be. It is no fit factor in ordinary farm operations with regard to rotation or aught else. While it is no doubt of a more permanent nature, it is something like the Hop craze that went through the country a few years ago—every one is rushing into Tobacco growing. Even away up north of the 44th degree, where a crop is never safe from frost, people are expending thousands of dollars for outfits. The business will not wear long under these unfavourable conditions. *W. D. Boynton, in "Farmer's Review," Oct. 23.*

THE NAMES "ABIES" AND "PICEA."

THE confusion that now exists in horticultural catalogues—both British and foreign—respecting the generic names of the Spruce and Silver Firs, is so great that scarcely two can be found in concord. Such diversity used not to be. For fifty years, I believe, the horticultural world, in this country at least, systematically called Spruce Firs "Abies," and Silver Firs "Picea." Now we are told that the old horticulturists were altogether wrong—that "Linnaeus made an accidental mistake," and so forth.

I am quite aware that it is a dangerous thing to call in question a change which Legan, I believe, with so acute and justly renowned a botanist as Dr. Lindley. Yet even the wisest men sometimes do questionable things. Soon after Dr. Lindley published the distinction between the two genera—(calling all the Spruce and Silver Firs, Abies)—my father wrote upon the subject, expressing his regret, and pointing out that the generic differences—to a nurseryman at least—were very real and visible; that even in the seedling state he could tell which was which with his eyes shut; that the Silver Firs, when 1 year old, had not more than six foliaceous divisions, while the Spruce Firs always had many more; that the cones of the Spruces were pendent, and had persistent scales, while those of the Silver Firs were erect, and had deciduous scales, to say nothing of the diverse form and texture of the leaves, with which most nurserymen are familiar. Dr. Lindley replied, "Mr. Buckhouse has pointed out a distinction without a difference."

I am well aware that it is now said that, while the determination of species depends upon the recognition of permanently diverse structure, the naming of genera is merely a matter of arrangement for scientific convenience, or to that effect. But science is not, or ought not to be, the author of confusion! If, for a century or more, Spruce Firs were called Abies, and Silver Firs, Picea, very substantial evidence of error ought alone to permit of change. By blending the two genera, Dr. Lindley virtually obliterated the generic name Picea. Obedient to this decision very many horticulturists have blended the two, so that now, all being classed under the name "Abies," you have to guess whether such and such a species is a Silver or a Spruce Fir.

An article in the *Gardeners' Chronicle* of June 20, 1863, p. 579, says "Dr. Lindley requests us to state on his part that he is not the author of the name Picea nobilis. . . . Like other scientific writers, he has refused to acknowledge the so-called genus Picea, which is a mere shop name, whose place is in the limbo of trade lists."

But soon followed another "upset," which I presume, Dr. Lindley would have emphatically protested against. We are now asked actually to reverse the old names, and to call the Spruce Firs Picea and the Silver Firs Abies! and we are told that Linnaeus accidentally reversed the original names of these genera. Obedient to this decision, catalogues now reach us so altered. And what is the result? It may almost be said that, horticulturally speaking, everybody is "at sea, in a perfect fog." It is, indeed, a most unsatisfactory state of things. I know that the argument is that scientific laws must be obeyed, how-

ever inconvenient and confusing they may sometimes seem to be. But may not a rule like this, though good as a whole, sometimes be carried too far?

I demur to the evidence upon which these generic names are reversed, and also to the declaration that Picea is a "shop name" that ought to be expunged. Though quite open to correction, I hold, still, that Linnaeus made no mistake; that the name Picea is no "shop name," but as old as Abies; and that Picea is the right generic name for the Silver Fir.

In a large and valuable Latin dictionary, of which I am the fortunate possessor, printed in 1684, and therefore long before the time of Linnaeus, I find the meaning of Abies "Fir tree"; and, in an accompanying note, the words "Abietarius negotiator, a timber or Norway merchant." Surely this proves that, 160 centuries ago, the word Abies was applied to the Norway Spruce, as that is emphatically the Fir of Norway.

The same dictionary gives "Picea, the Pitch or Resin tree," plainly recognising, at that early date, the distinction between the two genera. If, with evidence so old as this, and the fact that Linnaeus applied to the Spruce Fir the specific name Abies, and to the Silver Fir the specific name Picea, we couple the national custom in this land for a very long period—almost certainly for 150 years—surely it is not unreasonable now to object to change, unless it can be shown that the authority for such change is unmistakably strong and solid.

In the introduction to my friend Mr. Veitch's excellent *Manual of Conifers* it is stated that Professor Don separated the Silver Firs from Abies, and constituted them a new genus under the name of Picea—which reversed the names of Pliny and the ancient naturalists.

Surely there is a mistake here? Pliny, in his *Natural History* distinctly enumerates "the Pine, the Pitch-tree, the Fir, and the Larch;" and says "the Pitch-tree (Picea) loves the mountain heights," and "the Fir (Abies) grows upon the summits of lofty mountains." In chap. 18, he speaks of Picea as "a funeral tree," which, "as an emblem of death is placed before the door of the deceased," plainly indicating, I think, the dark Yew-like "comb-like" foliage of the Silver Fir. Again, Pliny says, "The Fir (Abies) is of a rounder form than the others, and its leaves are closely packed and feathered, so as not to admit the passage of rain;" and again, "From the branches of these different varieties . . . there hang numbers of scaly nodes of compact shape, like so many catkins." The cones of Picea [Silvers] do not hang—as is well known—but are erect upon the branches.

Now, if the Abies of Pliny grows higher up on the mountains, has closely packed leaves, and hanging cones, while his Picea grows lower down, and has comb-like funeral leaves, we are surely justified in regarding the former as the Spruce Fir, and the latter as the Silver Fir. Nor can I admit a mistake in the Linnaean names, especially as the Oriental Spruce (as described in the *Species Plantarum*) follows next to his "Pinus Abies," and he (Linnaeus) distinctly describes P. Abies as having "subulate mucronate leaves," while his "Pinus Picea" has "foliis solitariis piceamarginatis." Again, Pliny says, "the Pitch tree has a leaf more sparsely scattered than those of the Larch." The leaves of the Spruce are far less sparsely scattered than those of the Larch! Its foliage is more dense than that of the Silver Fir.

Pitch, though now mainly drawn from Norway, is not by any means exclusively so, and it is very probable that, in Pliny's time, it would be drawn mainly from trees growing upon mountain "heights," rather than from trees growing upon the "summits of lofty mountains" (to which positions respectively he assigns his "Pitch tree" and "Fir").

Admitting that there are some points in Pliny's descriptions of these trees which are, to say the least, perplexing, and which do not seem quite to harmonise with others, and that the summary of evidence may therefore perhaps be represented by the word "uncertain," I hold, nevertheless, that, with the

* The translators of Pliny's work remark, naturally enough, "If this is the case, the Pitch tree can hardly be identical with the Abies exselsa of the Candolle."

† In 1805 quoting Pliny as an authority, Linnaeus probably recognised the obscurity and uncertainty which attached to his names of these genera. His true cause may explain why many of the early botanists, whose names he does quote, ignore the generic Picea. His son, John, who gave the name Abies to his own Picea, in no way proves that he accepted their names, or intended to write Picea where he wrote Abies, and vice versa. How could Tournefort's "Abies ferri, Abies, Fructus arboris speciosae," or Rauh's "Conis arboris speciosae," be given by Linnaeus under his name Picea if he misapprehended for Abies?

* The same names were apparently used, both by Telford & Co., who had the York Nurseries for nearly a century before my father and uncle took them in 1824, and by the Norwich nurserymen, Mackie & Co., where my father "learnt the business."

† I believe these were the exact words, though I cannot easily find the article.

strong evidence which centuries afford of the name Abies having been applied to the Norway Spruce, and especially by Linnaeus, it is unwise now to overturn all this, as a name, if worth anything, ought certainly to convey a distinct and not a confused idea, which latter will undoubtedly be the case if generic names so long accepted have to be either annihilated or reversed. It is on this ground that we at the York Nurseries have continued to call the Spruce Firs Abies, and the Silver Firs Picea, and that we have declined to change till evidence of error, more clear and satisfactory than any yet in our possession, is brought forward. *Jas. Backhouse, York, November 14.*

THE AGRICULTURAL RETURNS, 1886.

WE have received from the Agricultural Department the "Agricultural Returns of Great Britain, with Abstract Returns for the United Kingdom, British Possessions, and Foreign Countries," for this year. The following information concerning the United Kingdom, gleaned from the book, may be of interest to our readers. It is stated that "as regards corn crops in Great Britain, that, compared with 1885, there is a decrease in the area under Wheat and Barley, and a further increase in that under Oats. The total area returned under Wheat is this year 2,286,000 acres—a decrease of more than 192,000 acres, or 7.8 per cent. less than that of the area of 1885, then the smallest recorded."

"The diminution of the arearound Wheat is reported to have been due to the unremunerative prices which have prevailed during the last year, and to the unfavourable seed time in the autumn of 1885; and spring of the present year. The precarious nature of this crop in Great Britain, and the competition with foreign grain, have further induced farmers to devote their land to grazing purposes instead, while in many districts where Wheat had been sown and had failed in consequence of the untoward season, the land was ploughed up and other crops substituted. It is further explained that, in the majority of instances in which farms are on the owner's hands, but little if any Wheat is sown." These facts make it evident that "Wheat is no longer our most valuable crop in this country, and it can hardly be doubted that it will probably become less and less a food of home dependence. The 4,419,000 acres of Oats, for example, grown in the United Kingdom are now worth more money value than the 2,358,000 acres of Wheat. Barley also, which this year occupies a smaller total area than in 1885, and very much less than the average area of the last ten years, appears to be soon likely, in England, to exceed in extent as it does in the other divisions of Great Britain and in Ireland, the more rapidly diminishing acreage under Wheat, while the average produce of the Barley crop is already, indeed, worth quite as much per acre." Green crops are on the decrease: "The total area was 3,480,400 acres, or 41,000 acres less than last year's figures." Flax was returned as being "grown on 3000 acres," and it is stated that "where its acreage has slightly increased, it is mainly experimental."

"The cultivation of Hops has not been quite maintained, there being about 70,000 acres grown in 1886 as compared with rather more than 71,300 acres in 1885; a decrease of 1200 acres, or nearly 1.8 per cent. Part of the decrease in Kent is, however, in some districts only apparent, from over estimates made in the acreage of last year, when many growers objected to make returns who have this year furnished them." It is also shown that "there is a further increase of 2745 acres in the area of orchards in Great Britain, it being now 200,284 acres. Market gardens likewise show an increase, namely, from 59,473 acres in 1885 to 60,850 acres in the present year. Several collectors report under both these heads a continually growing demand for fruit and fresh vegetables for towns situated even at considerable distances from the district where these are grown, and that farmers are therefore induced to appropriate some land to this produce."

"The importations of raw Apples and other raw fruit decreased in 1885, as compared with those of the preceding year, but in the first eight months of 1886 augmented imports in these descriptions of fruit taken together appear in the Customs' Returns, so that there is apparently scope for yet more extended production in this direction. In land

used by nurserymen for the growth of trees, shrubs, &c., about the same area is occupied as last year."

Turning now to Ireland we observe it stated that "as regards corn crops there appears to be a decrease of 2400 acres or 3.4 per cent. in the average under Wheat which was sown only on 683,400 acres against 70,800 in 1885; Barley shows an advance from 179,700 acres to 180,700 acres, but Oats, the most important corn crop, were less by 4800 acres, the area being now 1,323,200 acres against 1,328,000 acres in the preceding year. Rye increased by 2200 acres, while Beans and Peas occupied practically the same area, showing a total diminution of 3400 acres under cereal crops. The area under Potatoes, which covered 797,000 acres in 1885, was increased by 2700 acres in 1886. Turnips were more by 2300 acres, occupying 209,273 acres against 206,900 acres in the previous year. Mangel and Beetroot increased by 200 acres. The land under Cabbages and Rape was less by nearly 2000 acres, and that under Vetches, Lucerne, and other green crops by about 1100 acres, showing however, altogether, a net increase of 2300 acres under green crops. Flax was grown on nearly 128,000 acres, or an increase of nearly 20,000 acres over the acreage of 1885. The land returned under bare fallow was less by 2000 acres.

We take the following statistics from tables showing the distribution of the crops, &c., in Great Britain (excluding Ireland):—

ACREAGE OF ORCHARDS, MARKET GARDENS, AND NURSERY GROUNDS, AS RETURNED ON JUNE 4 IN 1885 AND 1886, AND OF WOODS AS RETURNED IN 1881.

THE WEATHER IN THE SOUTH.—A correspondent writing from Antibes, says the weather there has been frightful. "The deluge has recommenced." Let us hope it will soon cease.

MESSRS. C. LEE & SONS' NURSERIES, FELTHAM.

THIS is one of the branch nurseries of what was the old firm of John Lee & Co., devoted exclusively to the cultivation of a fine collection of Conifers and shrubs.

Historical importance also attaches to the place, the nursery being skirled on one side by some old Scotch Firs—a remnant of old Hounslow Heath.

A walk up the avenue to the nursery brings one at once into view of many exotic species of trees. To cite only a few examples out of the many—California contributes Abies amabilis, true—a this beautiful conifer is the rarest and decidedly one of the handsomest of the Silver Firs. A note of interest in connection with this plant is well worthy of being placed on record here. Mr. Isaac Dixon, who has spent the best part of a lifetime at this nursery as manager, believes that it forms part of the original stock of this tree, sent home by Douglas when travelling for the Horticultural Society, about the year 1831. From the Rocky Mountains came that lovely glaucous variety, Picea pungens. Japan, that land of gardeners ad fine shrubs, sends those magnificent things—Thuopsis borealis, Thuia falcata, T. Standishii, Cryptomeria elegans, C. Lobbii, Taxus adpressa, T. cuspidata, fine Keteinosporas in variety, and a plant that the Japanese have used from time immemorial in planting round their temples—the Umbrella Pine, Sciadopitys verticillata. From the mountains of Chili comes that

effective lawn tree, Araucaria imbricata; Pinnaculopsis elegans, an erect growing shrub, also comes from the same land.

The Silver Firs are an unusually fine lot of stock. We noticed handsome specimens of Nordmanniana, grandis (this needs no words to recommend it), nobilis, conspicuous for its whitish-green leaves; magnifica, some superb examples; and Pinsapo, of noble and erect growth.

Golden Yews form a very conspicuous feature in the avenue; they are of all sizes, and are trained in various shapes—some as pyramids, others as flat as tables, many vase-shaped, and a lot of fine standards, the principal varieties being Taxus baccata (common), T. adpressa, T. a. stricta, T. aurea, T. Davstoni, T. dumosa, T. fructu-luteo, T. Washingtoni, T. japonica, T. fastigiata, T. f. aurea (Standish), T. elegantissima.

Golden, silver, and green Hollies, from 10 to 20 feet high, are especially fine, of such sorts as Golden Queen, I. Hodginsii, I. heterophylla, I. latifolia, I. pendula aurea (Waterer's), I. Fisheri, I. chrysoarpa (yellow berried), I. baccata, and others.

Cupressus Lawsoniana aurea variegata, a variety which originated here, was in fine form, a stock of it is being worked up; C. L. lutea, another good introduction, was also very bright and attractive.

Retinospora squarrosa.—This is probably the finest specimen to be met with in the country; it is one of the many striking objects in the avenue.

There are many other fine subjects in this avenue that deservedly demand notice, but it is quite sufficient just now to say that every tree or shrub worth growing, and proved hardy, is represented in it. At the end of the avenue is a finely proportioned specimen of Sequoia gigantea, some 30 feet in height.

In reference to subjects grown in quantity it are called "breaks" may be specially noted Cupressus Lawsoniana erecta viridis, an enormous and wonderfully even grown stock—in fact, enough of it cannot be grown, so great is the demand.

Of Aucubas and Hollies there are great numbers grown. Thuopsis borealis is also another good town shrub that is being grown in large numbers.

Taxus baccata fastigiata aurea (Standish), unlike other golden Yews with striped leaves, has entirely golden foliage—in fact, it may be said to be bathed in gold. It does not burn like some of the Yews

indeed, it receives an increased brilliancy when lully exposed.

A very thrifty lot of young *Araucaria imbricata* from English grown seed was very noticeable. It is important to know that English seed comes up so well, as hitherto it has been the custom to rely on other sources for our supply of this tree.

Rhododendrons are largely grown. Touching named sorts, the practice here is to layer the plants, this mode of procedure ensuring more "stocky" and bushy plants than when they are grafted. Newer sorts are of necessity grafted, to get up a stock quickly.

Regarding flowering shrubs, both for outdoors and forcing, Mr. Dixon considers the best three to be *Viburnum plicatum*, *Staphylea colchica*, and *Philadelphus aurea* var., the Mock Orange. Of this plant there is a very fine specimen in the avenue, which when in bloom was quite a floral picture.

The firm has long made hardy Heaths a great speciality—that old but still valuable variety, *Erica codonodes*, being grown in quantity. For winter bedding it is probably unsurpassed, its numerous white rose-tinted flowers producing a pretty effect. *Azalea atlaclarensis*, a sterling and free-flowering sort, deserves passing notice, as one of the best forcers, equalling *A. mollis*, of which we observed great quantities. A remarkable stock of Golden and Silver Ives is grown—worked on the common Ivy—a great many of these plants were used with much effect at the "Inventions" Exhibition last year, and are none the worse for the "dusting," thus showing their adaptability to towo-work.

A good dense hedge plant is *Ligustrum ovalifolium*, with leaves somewhat larger than those of the common Privet. One of the best of dwarf Box plants is *L. coriaceum*, with beautiful broad, dark, glossy leaves. Much more might well be said of this fine hardy plant nursery, from the "wee modest" innumerable examples 6 inches in the "breaks," to the magnificent and imposing specimens 30 feet in height in the avenue. Enough, however, has been written to show that this nursery contains subjects of no mean order and interest to planters at this season. The firm has lately secured another piece of land at Hounslow, which is stocked with Roses, fruit and forest trees, *Rhododendrons*, &c., containing some noteworthy features, to which we hope to refer in a future issue. B.

MINA LOBATA.

THIS is a Mexican annual climbing plant, figured in the *Botanical Register*, 1842, t. 24, but lost sight of since. By modern botanists it is included under *Ipomœa*, but the form of the flower is so very different from most of the *Ipomœas*, that we think it more convenient to preserve the garden name. Messrs. Haage & Schmidt of Erfurt have the credit of re-introducing it. These gentlemen speak of the plant as really magnificent, and express surprise that so remarkable a climber should have been suffered to go out of cultivation.

The genus *Mina* (named after Don Francisco Xavier Mina, a Mexican Minister) is closely allied to *Ipomœa*, and resembles in growth and its three-lobed foliage the species of this genus, but the flowers are totally different as concerns their form and their lovely colours. The flowers appear on fork-like racemes projecting from the dense and luxuriant foliage, and present thus, with their bright colours, a striking aspect. The flower-buds are bright red, but the colour changes through orange-yellow to yellowish-white when in full bloom. Another interesting and most singular feature of this plant, is that it retains the first racemes developed during the whole flowering season, the buds growing successively at the tops of the racemes, while the lower flowers, after blooming for a considerable time, fade; so that the plant thus bears continually clusters of flowers from the bottom up to the top of the plant. The oldest racemes attained a length of 15 to 18 inches at the end of September, and had produced thirty to forty individual flowers on each fork-like raceme, of which there are six to ten in full bloom or in coloured buds at one time. The tube-like flowers are almost horizontal on the erect peduncles, and measure when fully developed three-quarters of an inch in length, while the uppermost coloured bud is only one-eighth of an inch long. This plant proved to be a very rapid-growing climber under cultivation; the seeds were sown in March, and the seedlings were cultivated in pots until the middle of May, when they were planted out in

the open ground, and at the beginning of August had formed pyramids of over 18 feet in height, well furnished with green luxuriant foliage, and profusely covered with flowers, as will be seen by the annexed illustrations (figs. 132, 133), which shows a part of one pyramid, reduced from a photograph. It thrives well on sunny situations, and is well suited for covering arbours, trellises, &c., on account of its rapid growth and great dimensions.

FORESTRY

WHAT IS THE PROPER SEASON TO PLANT?

THIS is a question which arises very often, and upon which there exists a very considerable diversity

absolute success be devoted to planting operations. This, therefore leaves nine months which may be devoted to planting, of one description or another. It is therefore obvious, that any arbitrary rule must necessarily be useless.

There are many conditions which must be taken into account in settling when to plant; permit me to mention a few—soil, exposure, description of plants to be used, size or age of plants used, the state of the weather, the dryness or dampness of the ground to be planted, &c. If the soil is dry and the plants used not more than from 18 inches to 2 feet high, I would recommend planting from October to December, provided the locality is not over-exposed; if, on the other hand, the ground to be planted is very much exposed, I should say that from February to April is the better season.

Should the plants selected be large coniferous plants, say from 2 to 3 feet high, I always recommend spring in preference to autumn planting, and my own experience is borne out by many competent authorities, such as Sang, Nicol, Brown, and others.

I have always found that hardwoods, such as Oak, Ash, Beech, and in fact all deciduous trees, are, as a rule, better planted in autumn; and again, all evergreens do better planted in spring. Again, this must be further qualified by the nature of the soil, both as to quality and comparative wetness or dryness. If dry, plant if possible all deciduous plants or small evergreens in autumn; if wet retentive soil, plant in spring.

There is also another circumstance, although not of a scientific nature, which must weigh with every one in settling this question, viz., the convenience at command to get the work done at a certain season, besides the possibility of unfavourable weather. These have all their effect in fixing the proper, or rather, under this head, the most convenient season for planting operations. My experience, therefore, is, plant deciduous plants in autumn, so as to give them time to establish their roots, and enable them to throw leaves in spring; plant evergreens in spring, so that the early approach of growth will prevent an undue check to the maintenance of their leaves, besides any prolonged interference with the permanent root-action which I believe must be going on with them, as opposed to deciduous plants. Under these circumstances, I think it will be easily understood, as I have said at the outset, that it is out of the question to prescribe any infallible rule on this subject.

I am much pleased that my friend Mr. Webster has adverted to this subject, and trust that he will receive in kindness this expression of my opinion on what is generally a very excellent contribution to our practical knowledge of forestry. C. S. F.

NOTES FROM THE LATE COLONIAL EXHIBITION.

(Continued from p. 622.)

Birchwood, particularly that of *Betula alba*, or the white Birch, is much used in this country for slate frames, bobbins, and spools, light furniture, and occasionally for toys. The wood is light, easily worked, and takes a very fine polish. It lasts well under water, for which reason sluices and floodgates are made from it, as well as ship bottoms, and piles from the older and harder trees. *Betula lenta*, the black or Cherry Birch, of which some notes appeared recently in your columns regarding timber produced in this country, is a valuable tree, the wood being hard, of a beautiful reddish tinge, almost like Mahogany, and extensively sought after for cabinet-making and indoor purposes generally. It is perfectly well adapted for culture in Britain, and being a handsome average-sized tree, and valuable as a timber producer, should, we think, be freely intermixed amongst our commonly planted hard woods.

MAPLES.

Other valuable woods, of which fine specimens were exhibited, were the various species of Maple (*Acer*), red Alder (*Alnus rubra*), Poplar, *Arbutus Menziesii*, of which a very peculiar growth was prominently exhibited; *Quercus Garryana*, prettily veined; American Lime, Elm, Ash, and various others. Two examples of Pine wood, a description of which was somewhat omitted at the proper place—*Picea sitchensis*, and *Pinus ponderosa*—were, I find from my notebook, particularly attractive, that of the latter tree having a pretty yellowish tinge, and labelled as hard, heavy, and durable. It is rendered of interest as being a tree that is not uncommon in this country.

FIG. 132.—MINA LOBATA: PORTION OF FLOWER-STALK. FLOWERS ORANGE TO RED, NAT. SIZE.

of opinion; it is therefore worth a little further inquiry. In the very excellent and instructive article in your issue of the 4th Mr. Webster adverts to the subject, and the teaching of his article seems to me to imply, that in every case autumn, or "fall planting," as it is called, is preferable to spring planting, and the reasons he assigns for this are thoroughly pertinent, and so far scientifically sound. While, therefore, conceding this, and further admitting that in many cases he is correct, I by no means admit that in all cases planting done in autumn is better than if done in spring.

It would be absolutely impossible to lay down any hard-and-fast rule on this subject, because there are so many circumstances which may alter the conditions necessary for successful planting. Planting may be done (according to an old accepted rule) in every month in the year in which the letter R appears, if executed with care, and under favourable conditions; even this rule may be so far stretched that in a late season the early part of the month of May can with

The wood of *Picea sitchensis*, from the example shown, is of a light clear colour, even and straight in the grain, and moderately hard. It is said to be valuable and much in request for various uses.

WOODS OF NEW BRUNSWICK.

With the arrangement of the New Brunswick wood trophy we were delighted beyond measure, for a simple glance at any particular wood had such connections as to remind one that they were actually standing beside a newly hewn down and quickly converted specimen of the tree. This trophy contained specimens of the woods commonly in use, these being arranged in panels, in three sections—first, Conifers; second and third hard woods, these latter being divided

panel, while at each corner of the frames were transverse sections showing the end grain and annual layers of woody matter.

As the whole design was unusually elaborate and artistically finished off, and every specimen accurately and legibly named, the collection was of great value to the practical woodman, for not only were the various timbers shown in every position, but the bark, fruit, and flowers were not, as is too often the case in such exhibits, made of secondary importance. Great credit is certainly due to the inventors or designers of such a practical as well as pleasing method of illustrating their various forest trees and the peculiarities of their timber. *A. D. Webster.*

(To be continued.)

respect to-day. I would, with your permission, refer to about a score deserving of notice, and that are new and entirely distinct, and most of them likely to be largely grown in future—commencing with—

New Singles: *Lady Churchill*.—At first glance the florets form two distinct concentric belts; the inner tubular portion is pale yellow, while the expanded outer circle is of a bronzy-purple, both curiously contrasting with each other, and with the bright yellow disc cushion in the centre. *Crimson and Gold*.—The large triple circle of ray florets are intense crimson, rising out of a high central golden disc, probably the best of its class for cutting or decoration. It is of American origin, and said to be useful for hybridising purposes. A fine contrast with America, single white-blush.

New Japanese Anemone: *Cincinnati*.—This is another for which we are indebted to our American cousins, and which promises to be an acquisition to a class that seems rapidly to increase. The outer fringe florets are long, flat; drooping, and of a pleasing rosy-blush fading to white. The short central petals are somewhat deeper tinged; the surface, unlike some others, being very even. If I recollect aright, Messrs. Cannell got a First-class Certificate for this at the Crystal Palace on the 6th inst. Mrs. Holmes.—Much of the same character, but I understand a freer bloomer, with the flowers always coming perfect, and with the important difference, that instead of drooping the ray florets stand firmly horizontal. Its stiffness is an advantage, and makes the blooms seen larger, though they are considerably smaller than the preceding. This has been raised by Messrs. Cannell.

Fimbriated: *Cresus*.—A welcome addition to a handsome but limited class. The colour, orange-red, tipped with gold, is very effective and telling. The size and density above the average, and has deservedly got a First-class Certificate. Much superior to *Arbre du Noel* of old varieties. *Scappin*.—A shade smaller, purple-flesh colour, and a fine contrast with the foregoing. Both are packed with petals, handsomely reflexed, forming half globular velvety cushions.

Reflexed: *Elsie*.—It is time to have some valuable additions to this class. If Cullingfordi was an undoubted acquisition, this will this year be as decidedly so; nor does it displace any favourite, being entirely different from any other. Wherever it has been shown it has received a First-class Certificate, and must enhance the reputation of Messrs. Cannell's firm. The colour is primrose or sulphur-white, the florets large and slightly fluted, and produced in immense numbers so as to give the blooms great depth, unusual with reflexed varieties. *Mons. Ulrich* his.—This is one of Delaux's newest introductions, but at present it is doubtful if it must not be described as a reflexed Japanese. The colour is very effective, deep, rich crimson with a tinge of orange, and having the broad flat petals tipped with gold. It shows a centre, but cultivation will remedy this.

Incurved: *Bronze Queen of England*.—Sport from Queen of England (*Her Majesty*) with all the good qualities of the well known Queen family; will evidently be very largely grown in future. *W. K. Harris*.—A new Japanese introduction. Inside of the florets crimson streaked, reverse nankeen-yellow, with a bronze shade. When well grown this forms perfect balls that at first look reminds one of fruit farming! It would seem to have some Japanese blood, and the same applies to another that will ultimately be placed in the incurved Japanese section, and that Messrs. Cannell have significantly named after the *Chrysanthemum* hero of the hour, Mr. E. Molyneux.—The colours of the last are intensified in this, the reverse petals golden. *L'Or du Japon*.—Unlike the two last named, this under no circumstances shows a centre; and another variety will probably be much sought for, as there is nothing in the incurved class similar. The florets are broad, deep yellow, with a dash or shade of bronze; and if well grown, the petals might not seem so loose, which at present gives it a Japanese character. If Pethers sent out no other, this would perpetuate his memory. *Frank Wilcox*.—Of smaller size, of bright bronzy-red, with marginal gold shading, splendid shape, and will become a valuable addition if it can be grown perfectly double. The extremities of the florets are slightly fringed or fimbriated. There are some other new things, but it is doubtful how to classify them.

Japanese: *Gloriosum*.—As usual the largest accessions are to this class, and the difficulty seems to be to sift out the best, as, *primis facie*, it is undesirable to certificate any inferior and similar to an older

FIG. 133.—MINA LOBAFA: PART OF A PLANT, FROM A PHOTOGRAPH (REDUCED). (SEE P. 684.)

into two kinds, hard and soft, and all together embracing about fifteen kinds.

Arranged perpendicularly at the base of these were 3-feet long logs of the same wood, with the bark intact, while sapling trees, likewise of the same kinds, formed the sides of the panels. Each wood had a twig of the foliage and flowers to which it belongs painted upon it, and so nearly did these approach Nature in appearance that we were at first quite deceived, taking them for the real foliage and flowers. Between the logs just described and the large panels was an inclined frame containing some thirty small panels of the lesser growing woods, and on each of these was, likewise painted the foliage or fruit, sometimes both. Each panel was artistically framed or mounted with a narrow strip containing the bark of the same wood as formed the

Florists' Flowers.

NEW CHRYSANTHEMUMS AT THE "HOME FOR FLOWERS," SWANLEY.

I was greatly struck when visiting Mr. Cannell's famous florist establishment about the beginning of September with the vast numbers of *Chrysanthemums* undergoing their first trial. Many were, we understood, locally raised seedlings; but the greater number had been imported from Japan, America, France, Belgium, &c. I asked to be allowed to see blooms of some of the new kinds I noted when fully developed, and had a rare and varied treat in that

introduction. Of *Gloriosum* there can be no such doubt, and I may deservedly name it first, as it merits all the encomiums bestowed on it, as well as the certificates. The colour is bright lemon yellow, florets unusually long, tubular, and slightly twisted—upright and very distinct. Alfred Chantier.—I place this next, as in character very similar, long, tubular, upright; florets of the Leon Brunel style—very showy. Colour faint rose-lilac, shading towards the tips to buff—one of Delaux's. *Koi des Japonaises*.—First-class Certificate. Broad drooping florets of a reddish-crimson colour, tipped gold, somewhat resembling Delaux's *Étoile du Midi*, but said to be different in many respects. Mrs. H. Cannell.—The whites of the *Lady Selborne* type in this receives a welcome addition, especially as it will commence blooming when that fine sport from James Salter is declining. The florets are broader and somewhat inclined to incurve, and with good treatment may be expected to increase its petals. First-class Certificate. *Don Quichotte*.—In this *Reydellet*, the raiser, seems to have scored to win. The colour, not easily described, is new and very pleasing—a bright lilac suffused with rose magenta, fading lighter to the points, which are prettily recurved. I know of no softer or more tender winning shade of tinting. Minnie Miller.—Rose magenta, free growing and fine, with incurving florets. It remains, however, to be seen whether this will, or can be grown perfectly double; it takes always two or three years to decide this. *Ilanomah*.—One of the new American Japanese, seemingly distinct in shape as well as colour from former introductions. The body colour is white, the outside of the semi-globe—for this is the shape—is pinkish and tinted with lavender-cream.

Although this pretty considerable list so early in the Chrysanthemum season may exhaust your space it does not exhaust those for which Messrs. Cannell have already received certificates, as I find I should have included two such fine things as *Elsie Durdan* and *Jane*—the latter a very effective white-rosy single. *W. J. Murphy, Clonmel*.

SUPPLEMENTARY LIST OF PERENNIAL ASTERS.

(Concluded from p. 650.)

ASTER TRICETHALUS, C. B. Clarke.—Rootstock creeping; stems from 1 to 2½ feet long, erect, leafy, puberulous, bearing one to three large showy heads; radical leaves obovate spatulate, on long winged petioles; margins entire, undulated, glabrous or hairy; cauline leaves oblong, half amplexical; involucre half an inch high; bracts numerous, linear, outer ones longer than the inner; ligules forty to fifty, narrow, over half an inch long, purple; achenes slightly compressed, pubescent; pappus-long, simple, silky-white. —Sikkim Himalayas, 10,000–14,000 feet elevation. This species is nearly allied to *A. himalaicus*, and was at first thought to be a more developed form only, but besides being taller and more robust, the involucre bracts are narrower, and the pappus stouter. It has been some years in cultivation, and promises to make a good garden plant. Flowers July and August.

ASTER PALUDOSUS, *Ath.* (SECTION HIELEASTRUM.)

Stems from 1–2 feet long, sometimes branching, bearing few or several racemously or spicately disposed heads; leaves broadly or narrowly linear, 2–4 inches long, and about a quarter of an inch broad, light green; involucre about half an inch high, nearly hemispherical; bracts unequal, the outer very lax, lanceolate, subulate, the inner ones linear, spatulate, with herbaceous acute tips; rays short, handsome, deep violet. (*A. grandiflorus*, Nutt., non L.; *Hieleastrum paludosum*, DC.; *Tripodium paludosum*, Nees.) —Flowers August to October. Native of wet pine barrens in the low country from North Carolina to Texas, Arkansas, and Missouri. A charming little species well adapted for culture in the vicinity of lakes or ponds, and promising to be a good garden plant.

ASTER TRINERVIUS, *Asch.* (SECTION ORTHOMERIS.)

Stem 2–4 feet long, simple, grooved, hipid or sometimes almost glabrous, bearing a few large loose corymbose heads; leaves 1–4 inches long, lanceolate acute, the upper sometimes obtuse, coarsely serrate, rough on both surfaces, and reticulately veined; involucre bracts linear, imbricated, mostly acute, with

reddish tips; ligules 12–15, inclined to reflex, half an inch long, narrow, white or pale bluish; disc flowers yellow, prominent; achenes hairy; pappus reddish with a few shorter outer hairs. (*Aster scabridus*, Hook. fil. and Thoms.; *A. Benthami*, Steetz; *A. asperimus*, Wall; *Gilatella asperima*, Nees; *Diplopappus latus*, Benth.)—Widely distributed in Central and Western Himalayas, Sikkim, 5000–7000 feet, Khasia Mountains, 3000–6000 feet, extending also to China and Japan. It seems to be very variable, both in habit and leaves, the name unfortunately being far too rear *A. trinervis*, Desf., to be safe in gardens. A fairly showy species with larger flowers than the older *A. sikkimensis*. Flowers September and October.

ASTER SIKKIMENSIS, *Hook. f. and Thoms.*

Stems 3–4 feet long, much branched from base, erect, smooth, obscurely grooved, leafy, and bearing numerous large loose corymbose heads; leaves lanceolate, acute or acuminate, 3–7 inches long, ½–1 inch broad, contracted towards base of petiole, and again widening into broad auricles, half amplexical; involucre half an inch high and as broad, not imbricated; bracts numerous, linear-acute, reddish-brown, slightly pubescent, and all about one length; ligules 30–40, very narrow, ½–¾ inch long, generally reflexed, purplish; achenes bispid, four-ribbed, half as long as the simple silky-white pappus.—Eastern Nepal and Sikkim, 6000–12,000 feet elevation. This species has been long cultivated in gardens, though much less showy than *trinervis*, perfectly hardy, and inclined to run by means of underground stems. Figured, *Bot. Mag.*, t. 4557. Flowers August to October. *D.* [By an oversight the first part of this article was attributed to Mr. Baker instead of Mr. Dewar. Ed.]

ORCHIDS AT MESSRS. HUGH LOW & CO.'S.

The great attraction at the Clapton Nurseries at the present time is the large importation of *Angrecum sesquipedale* which recently arrived, and which is, doubtless, the most successful one of this plant ever made, both as regards the size of the specimens and their good condition. It is a novel sight to see such an array of tall leafy plants of this rare species; and from the sound appearance of the plants it is difficult to realise the fact that they have just passed through one of the most trying journeys an Orchid importer has to stand the risk of. With them, also lately arrived, are many sturdy plants of the true *Angrecum Ellisii* and *A. articulatum*, both of these being well furnished with flower-spikes ready to come a way at once. These two plants are often confused with each other in gardens; but as varieties, if not as species, they are distinct in growth, and the flowers of *A. Ellisii* have cinnamon coloured tints, while the long racemes of *A. articulatum* are wholly pure white. Other rare *Angrecums*, and some probably new ones, and the pretty *Acanthus Curnowiana* are also among this importation; and among those previously imported the pretty *A. hybridus* and *A. fastuosum* are in flower; the latter have very curious fleshy leaves, and bunches of comparatively large snow-white flowers.

CATTELYAS.

The *Cattleya*-houses contain a seemingly countless number of grand established specimens, leafy, clean, well-rooted and well-furnished with flower-stalks. To some of the leading kinds separate long span-roofed houses are devoted. The varieties of *C. Mossii*, including some good masses of *C. Wagneri* and *C. Reinckiana*, occupying one of them, the *Mendelii* another, the *Trianae* a third, and so on. In the matter of present flower a charming and fragrant *C. Gaskelliana* was the best of any, some three hundred flowers having been furnished by it lately, and those which are now out and coming on bid fair to supply bloom until the rising buds in the *Trianae* house open. One large specimen of *C. Gaskelliana* now in flower is equal to the true autumn-flowering *labiata*, and if cut flowers of it were sent to a competent judge it would probably be so named. Also in the *Cattleya*-houses are a fine lot of *Cattleya amethystoglossa*, rather a houseful of *C. Eldorado* and *C. superba*, a large quantity of stout specimens of *Lælia purpurata*, and in bloom and making a fine show a quantity of *Lælia autumnalis atrovirens*, and, in bud, the most regularly flowered large batch of *Lælia peduncularis* we have ever seen. When its flowers, which always remind us of *Ixias*, are open,

it will be a pretty sight. *Cattleya aurea*, too, *C. guttata*, and various others are in bloom in the *Cattleya*-house, where also a unique specimen will be found in *C. resplendens*, which is probably a *C. Schilleriana* hybrid.

PHALÆNOPSIS.

The *Phalænopsis*-house is always of interest at Clapton, notwithstanding that most seasons many of the flowers fall victims to the fogs. This year the thousands of plants of all the best species in it are better furnished with spikes than usual—the whole are literally bristling with them; better than all, too, they are much more backward than usual, and it is believed that the flowers will escape damage this winter. If so, it goes without saying that Messrs. Low's house of *Phalænopsis* will later on present a show of these plants in bloom the like of which has never been seen here. *P. Stuartiana*, which is one of the prettiest and also the freest growing of the species, is looking very fine, and *P. Sanderiana*, which give noble flowers of a pleasing pink tint, and the neat little *P. rosea*, are in bloom in several varieties.

CYPRIPEDIUMS.

A large span-roofed structure is filled with *Cypripediums*, the leaves of many of which are handsome enough to warrant their being grown as foliage plants; but how doubly welcome are they on account of their quiet and pretty flowers. Some of the best species are grown by the thousand here, and notably the stately *C. Lawrenceanum*, whose handsomely marked plants send forth such grand flowers—some now open, and some coming on—and the snowy *C. niveum*, which is everybody's favourite. *C. ciliolare*, *C. Lowii*, *C. Parishii*, *C. Spicerianum*, and most of the other good sorts are here in quantity, a large lot of *C. Haynaldianum* being in bloom as well as sundry plants of *C. Crossianum*, *C. Spicerianum*, *C. Koelzii*, *C. Harrisianum*, and others.

COOL ORCHIDS.

These have received a very important addition in the large span-roofed structure near the entrance, which is now devoted to the large established specimens of *Odontoglossum Alexandræ*, of which the house contains a great quantity, and out of which interesting hybrids are frequently flowering. The strain there is of the best; and out of Messrs. Low's importations some superb varieties of the guttatum and fastuosum class have flowers which are scarcely surpassed by the famed *O. Veitchianum* itself. At present some very good forms are in flower, and the clean, stout, and actively rooting plants are sending up a liberal supply of spikes for flowers in the future.

The smaller plants and fresh importations are continued in many long, low spans, one being entirely filled with *O. Pescatorei*, and all in fine condition. Among the good things in bloom we noted *Masdevallia racemosa Crossii*, *Restrepia antennifera*, *R. elegans*, and a new one with the habit of *elegans*, but striped longitudinally, not spotted; *Ionopsis paniculata*, *Oncidium bicolor*, many *O. varicosum*, and varieties of *O. pretectum*; some pretty *Barkeria elegans*, and other *Barkerias*, which grow well here in a cool light house; many *Oncidium tigrinum*, *Maxillaria venusta*, *M. nigrescens*, and *M. lepida*; *Pleione birmanica*, *P. Wallichiana*, and *P. maculata*; a great many distinct varieties of *Lycaste Skioneri*, *Dendrobium uncatum*; a well budded batch of *Dendrobium Lowianum*; a large, well grown, and profusely flowered lot of *Odontoglossum Koelzii*; *O. rosmassinum*; *Masdevallia tovarensis*, a quantity of *Oncidium Kramerii* in bud, an equally good supply of *Ceologyne ocellata* in full bloom, and sufficient other good things to prove that, notwithstanding the immense number of plants in stock, Messrs. Hugh Low & Co. cultivate them up to the best flowering capacity, a fact, however, which is proclaimed by the healthy, clean, and stout appearance of those not in bloom.

BUDDEIA CURVIFLORA FRUITING.—Judging from specimens grown both in the Kew and Cambridge Botanic Gardens last summer, the fruiting of this species would seem to be as regular and plentiful as that of its more widely cultivated and better known cognate *B. globosa* is scarce. The fruiting of the latter was recorded in the *Gardeners' Chronicle*, p. 306 of the present volume. The inflorescence of the two is widely distinct in general appearance, and if conspicuousness, or general showiness, had any influence in attracting insects to set the flowers, *B. globosa* should receive the first share of attention.

The Flower Garden.

SUBJECTS TO PLANT UNDER TREES.

THERE are few places where there are not spots bare of grass under trees. These might be made objects of interest if a few pieces of rock and old tree roots were available, and set on a few barrow-loads of leaf-mould and loam, to be planted with the commoner kinds of Ferns, winter Aconites, Snowdrops, and any other plants which flower early and mature their growth by the time the trees put forth their leaves. The following evergreen and flowering shrubs are suitable to plant under the drip and shade of trees:—Evergreens: Aucubas, Buxus, Taxus, Ephedra, Hypericum, Ilex, Ligustrum, Prunus, Ruscus. Deciduous: Corylus, Dybne Mezerion, Rubus, Sambucus, Hypericum, Spiræas, Symphoricarpos, and Euonymus.

PROTECTION.

The protection of tender shrubs, such as Laurustinus and the tenderer kinds of Conifers, will now need attention. The best sort of protection is that which affords only a partial shade, branches of Spruce Fir, for if the frosty winds be filtered through the Spruce branches which have shed their needles and only have a good furnishing of twiggy shoots, those are preferable to fresh cut boughs, the plants will come through the winter much better than if they had been protected with mats or other more dense materials. Upright poles driven into the ground at distances of 2 feet, and the branches woven around in basket fashion, is the quickest mode of protecting tender plants. Plants on walls, trellises, &c., may have a covering of the same description fastened over them, but not so as to exclude light from the shoots; dry bracken is also a good covering in such situations; I have used it with good effect on Tea Roses and others planted in beds. A little shaken over the Rose shoots in frosty weather is a capital means for warding off hoar frosts, and in low moist districts this good effect will be remarked in the vigour of the plants afterwards.

ROSES.

The following year, if not already done, Roses should receive a good mulching of manure. Where standard Roses are grown on grass, the turf should be removed 3½ to 4 feet in diameter, and the soil forked out amongst the roots of the plants. Sufficient new turfy loam should be in readiness, and a liberal quantity of Thomsson's Vine and plant manure should be mixed with the new soil as the filling-in proceeds. I treated a whole house of Roses in this way last year, and the result was marvellous. Many of the flowers were over 6 inches in diameter in the month of March, and not a speck of mildew to be found in the house.

BEDDING PLANTS.

Frequently examine all stock of bedding plants, and remove all decaying foliage; stir the surface of the pots to keep the soil sweet; be careful with the watering of them, and choose a dry clear day for the operation, and let it be done early, at the same time admitting all the air possible to dry up the moisture before night. *W. M. Baillie, Luton Ho.*

PLANTS AND THEIR CULTURE.

GREENHOUSE PLANTS.

To succeed Chrysanthemums, a good supply should now be available of such things as Epacris, Erica, Carnations, Primulas, zonal Pelargoniums—of doubles, Wonderful, Jewel, W. E. Gladstone, F. V. Raspail, Attraction, Rosa Bonheur, Clara Fitzer, Sylvia, Rosa superbis, candidissimum plenum, Nympe, Mrs. Orton, Lovely, Carillon, &c., will be found the best to open their blooms and to suffer the least from damp. From the forcing-house will come Azaleas, of which Deutsche Perle, punctulata, and Énone, will be very serviceable; Roman Hyacinths, Tuberoses, Calla æthiopsica, Lillies, and Cytisus. The Cactus Epiphyllum in variety is unsurpassed for giving a glow of colour at this season. This plant should be worked on Pereskia aculeata if the plants are to be used in cool conservatories, &c. Camel-

lias which have done flowering should be put under growing conditions, so that they may make an early growth, and set their blooming buds early in the season. If the wood of the Camellia and other plants be well ripened, and the plants set under cover early in the autumn, there should be no difficulty in securing a good supply of early bloom. The time for the training of greenhouse twinders and climbers has now arrived, and with regard to hardwooded plants every specimen should be trained and staked anew annually, for, no matter how good the stakes may be, they will not last for two seasons. Be careful when removing them to get every part out of the soil, otherwise they may cause damage to the plants by the fungus engendered, and the new stakes, which should be of the best red deal, can be inserted into the old holes. Do not use too many stakes, as one will be enough to support three or four shoots. Allow plenty of room in the ties, especially where thread is employed. There should be as much again room allowed as the size of the shoots. The largest specimen should be operated on first. This allows of the stakes to be repainted and used for the next size, and so on until the plants of the smallest size are finished. When commencing to tie a plant, whether it be of a low bush form, or of an upright or pyramidal shape, it should be from the first tied in so as to keep the bottom part well furnished with fresh young wood; if however vigorous and fresh the top of a plant may be, if the lower part consists of bare sticks and branches it must be quite unsightly. *A. Evans, Lythe Hill, Haslemere.*

THE ORCHID HOUSES.

MASDEVALLIAS.

PLANTS of the Chimæra section which are placed in a warmer house to winter, should be examined for thrips, and red spider. The latter is often overlooked, the dark colouring on the back of the old leaves being in some instances caused by spider. A safe dip for these can be made by taking one handful of tobacco paper, steeping it for a short time in hot water, then strain off the water and add soft water, making about one pailful. After the dipping, lay the plants on their sides and sponge the leaves with the solution, which may be allowed to dry on them, many species of Orchids taking no harm therefrom.

TEMPERATURE.

The following temperatures will be safe with fire-heat:—Cocchinea, 48° to 55°; Cattleya-house, 58° to 65°; East Indian-house, 63° to 68°; Phalenopsis-house, 65° to 70°. During mild weather, the evening temperature may be kept a little above the lowest figures given, so as to guard against sudden changes in the weather during the night. With bright warm days the temperatures should rise several degrees above the average degree stated. Take advantage of mild weather to give a little to the various divisions, leaving the lower ventilators open until late in the evening should the temperature remain too high. *C. Woolford, Downside, Leatherhead.*

FRUITS UNDER GLASS.

CUCUMBERS.

The favourable weather has been of benefit to the plants, consequently they will be showing fruit freely. They should not, however, be allowed to develop more fruit than is required for use, as the object should be, from the time the plants were set out in September, to get the trellis-work well furnished with firm, and short-jointed wood before unless cold December sets in, and to take only as few fruits as would meet the demand, in the interval before Christmas. They will be better able to yield satisfaction up till March if the forces of the plants are economised. The mid-winter months are the most critical period in the year in which to maintain a full supply of Cucumbers, for which there is always plenty of demand. Therefore remove all superfluous fruit as soon as they appear, leaving only a sufficient number in various stages of growth to keep up a regular supply. The fruits should be cut before they become too large, and be kept fresh in a cool room until wanted. Plants which bore fruit during the autumn will be benefited by

the loose surface soil being removed from the beds, replacing it with a mixture of friable loam and horse-droppings (about three parts of the former to one of the latter) and at the same temperature as that of the bed. Keep a night temperature of from 65° to 70°, according as the weather is cold or mild, and 5° higher by day with fire-heat, running it up 10° or 15° with sun-heat at closing time, which ought to be about 1 p.m., at which time, as well as in the morning, the plants and the house generally, should be damped with water at the same temperature as that of the house, and a bottom heat of 85° should be aimed at. Put a little air on bottom and top of the house as soon as the thermometer registers 75° on bright sunny mornings; afterwards increasing and decreasing the quantity given between then and closing time, according to the rise and fall of the internal temperature, so as to induce the plants to make a sturdy growth. Vigorous growing plants having the bottom-heat supplied by hot-water pipes, will require copious root waterings of diluted tepid liquid manure at intervals. Stop the fires by 8 o'clock on bright mornings, by which time, solar heat alone will suffice. This should be done on bright mornings, even though the thermometer does not register the minimum degree of heat at the time, so as to prevent waste of fuel and over-heating. To obtain the most heat without loss and to render the air more genial to the Cucumber, covering the house at night with mats or canvas is a tried thingy rather than otherwise over the trellis, removing whenever it can be done, old shoots to make room for young ones, which should be stopped at a joint or two beyond the fruits that are required for use. This manipulation causes the rapid swelling of the fruit. Should apbides attack the plants, fumigate the house two or three evenings in succession, airing it somewhat freely the succeeding days, syringing the plants afterwards with tepid water. Should mildew appear, dust over the affected parts while damp with the flowers of sulphur, and afterwards maintain a warmer and less humid atmosphere. Plants having their roots confined in pots or boxes will require liberal and frequent supplies of tepid liquid manure at the roots; and those growing in hot beds in frames will require having the linings freshened up weekly, by the addition of fermenting material, and the frames should be covered at night with mats and a sufficient thickness of Fern, to maintain therein sufficient warmth to keep the plants moving. *H. W. Ward, Longford Castle.*

"FRUGES CONSUMERE NATI."

[A Vegetarian Restaurant has been opened in the Strand opposite the Royal Courts of Justice.]

I HAVE always loved a vegetable dinner, I delight in the Creamy soup or Condé on the menu of the night; The Potato needs no praises, there is rapture too I wene On the face of every gourmet at the mention of the Bean; And, like wise Sir Henry Thompson, I can feel my heart aglow

At the thought of all the merits of the pleasant Haricot.

I am very fond of Cabbage, and the tender Spinach begs, Though it isn't quite *à la mode*, to be served up with poached eggs;

Then the Cauliflower is charming, and the Celery when viewed

Fresh and crisp from out the garden, or artistically stewed.

While surely on one esculent we're all unanimous.

Is there aught that's more enticing than thy taste—Asparagus!

All must love the lively Lettuce; we have reason too to bless

Cruetifer for sending us the piquant Watercress;

Upon any list of salads let the true Tomato stand,

With the Endive and the Beetroot as supporters o' each hand;

There the Cucumber awaits us, and we fain would keep alive

Both the Tarragon and Chervil and insinuating Chive.

There is poetry in Mushrooms, and the Lentil too can please,

And a thrill goes through my midriff at the thought of early Peas;

I am grateful to the Turnip and the Parsnip looking pale

There's the Salsify seductive and the delicate Sea-kale;

But the bard shinks back from one task, for no mortal ever can

Do full justice to the comfort that the Onion is to man

Then we'll hasten to the Griffin, for a little way beyond

Are the Vegetarian dining-rooms of Messrs. Spiers and Pond;

And the Doctors too are with us, men of note in London town,

Risdon Bennet, Milner Fothergill, and also Crichton-Browne;

They have told us very plainly that of health we should be winners,

If we ate less meat, indulging in more vegetable dinners.

—*"Punch," November 20.*

A LETTER in another column from our respected correspondent, Mr. JAMES BACKHOUSE, raises once again the question whether the Silver Firs should be called Piceas and the Spruces Abies, or *vice versa*. The confusion that reigns now is truly lamentable. So far as the nurseryman and the amateur are concerned there is, as we take it, no particular principle involved, and hence they are quite at liberty to employ whichever they think right, safe in the assurance that whichever convention they follow they will have the sanction of some authority. In the instance of botanists and students of Conifers the case stands somewhat differently. They are not at liberty to adopt either convention indifferently, or at least they must be prepared to show their authority for what they do, and if they venture to depart from established usage, they must show adequate reason for so doing, or find that their lucubrations are ignored by their cotemporaries and successors.

If we were writing a detailed monograph it would be incumbent on us to give a sketch of the whole history, or, at the very least, to give bibliographic references which should enable any student to find for himself the true state of the case. We are not here under that necessity, and our readers would not thank us for taking up their time with technical details of so dry a subject. Nevertheless, we may sketch the history of this Abies and Picea question in broad outline.

As a general rule the practice of botanists is to accept the names imposed by LINNÆUS until good reason is shown to do otherwise. They do so, not because LINNÆUS was always or necessarily right, but because he was the botanist who in the last century acted the part of registrar-general. He collected into orderly array and gave definite generic and specific names to what was then considered a vast number of plants and animals. By a useful convention, then, it became the practice to adopt the Linnean nomenclature, and not to interfere with it lightly or without reason. LINNÆUS, in most cases, adopted the names given by his predecessors when he could conveniently do so, but in this case of Abies and Picea it is stated that he made a mistake by confounding the Picea of PLINY with Abies. This point Mr. BACKHOUSE contests. The mistake, if mistake it were, was not primarily that of LINNÆUS, but that of DODOENS, *alias* DODO-

NEUS, whom LINNÆUS followed, instead of the other botanical authorities. Why LINNÆUS followed DODOENUS, and why he violated the otherwise unbroken tradition, would be an interesting point to ascertain. At any rate DODOENS and LINNÆUS called the Silver Firs PICEA, the Spruces ABIES. LINNÆUS, indeed, and after him PARLATORE, included both under one genus PINUS.

Now, in accordance with the ordinary convention, the names as applied by LINNÆUS should be adopted. Classical purists, however, protested against this reversal of the practice of antiquity; and among botanists DUROI, went back to the original practice, and called the Silver Firs Abies, the Spruces Piceas. The example was followed by many, and in 1841 we find LINK, the Berlin Professor, adopting the same course. From a botanical point of view LINK'S paper was very important, and of itself forms substantial authority; but LINK expressly tells us that he should not have reversed the Linnean practice if others had not done so before him; and, moreover, he gives his readers the option of adopting either plan at will. It is indifferent, he says, which plan you follow—"ut par sit ratio quos sequi velles." LINK'S paper was founded on the examination of the plants cultivated in the Berlin Botanic Garden, and his views were generally adopted on the Continent. CARRIÈRE'S monograph, followed by most French-speaking nations, is, in so far, arranged on Linkian principles. Unfortunately, in England, DON, and after him LOUDON and GORDON, refused to follow suit. And thus it has happened that while in Germany, France, and America, LINK'S practice has been generally (but not universally) followed, nurserymen in this country have adopted the opposite practice. Whether there is any obscure feeling of antagonism to anything foreign in this we cannot say, but it looks like an illustration of that singular habit of one nation doing the exact opposite of what is done by its neighbour. We keep to the left in driving, a Frenchman as persistently goes to the right; and so on. In some cases this diversity of practice is of no moment at all, but in this particular instance the diversity of practice is a great nuisance.

Our own custom in these columns of late years, has been to observe the Linkian plan, even though this is against the usage of LOUDON and GORDON. Our reasons for so doing have been often stated, but as Mr. BACKHOUSE once more raises the question, we may again formulate them. The balance of botanical authority is decidedly in favour of the Linkian view. All or almost all modern botanists who have studied Conifers adopt Picea as the name for the Spruces, Abies for the Silvers. We need not stay to consider the practice of compilers, who work at second-hand, for however valuable their labours they do not constitute authority. It is quite another thing with such men as ENGELMANN or PARLATORE—the authors of elaborate monographs drawn up from personal research, alike in the history of the order and the conformation of its members. This brings us to the consummate authority of BENTHAM, so lately taken from us. The *Genera Plantarum* of BENTHAM and HOOKER is a work of standard authority—no mere compilation, but based, wherever practicable, upon original investigation of every item, historical and botanical. This book will doubtless form the standard book for the nomenclature of genera for many years to come. It will rank with the *Genera* of LINNÆUS or JUSSIEU, and above that of ENDLICHER. BENTHAM, who was responsible for the elaboration of the genera of Conifers, after full consideration of all the circumstances of the case, after consultation, as we happen to know, with those botanists, British and American, best entitled to give an opinion, adopted the Linkian plan.

For our own parts, then, we prefer to follow the standard as laid down by BENTHAM, not slavishly indeed—for if there were good or adequate reason to differ from his conclusions we should exercise our liberty of doing so—but as the *Genera Plantarum* represents the condensation and digestion of all the available knowledge of the day upon the points upon which it treats, so we hold ourselves bound to follow it, until some one shows adequate reason to the contrary.

We dare not dictate—we have no desire to do so—to others—we should be glad to see them following a uniform plan, but we fear such unity is unattainable; but in the hope of getting some approximation to it we may throw out a suggestion, that if catalogue-makers would cease to concern themselves about Abies or Picea, and simply range the species under the head of Silver Firs or Spruce Firs respectively, much of the difficulty might be obviated. The botanists might go their ways, and adopt Abies or Picea, one, both, or neither, as it pleased them. Nobilis, amabilis, grandis, are all Silvers; excelsa, nigra, Menziesii, are all Spruces; so they may say Larches, Cedars, Pines, Junipers, Cypresses, &c., without troubling themselves about the Latin equivalents. Very rarely does it happen that any confusion would arise *in gardens* from this use of the specific name alone.

The case is paralleled by that of "calomet" in drugs. From time immemorial calomet has been known, and the name is still in use, but the ordinary public may be forgiven for not remembering whether chemists call it a chloride, a bi-chloride, a sub-chloride, or a proto-chloride of mercury. It is well for them if they do not confound it with "corrosive sublimate," another combination of mercury and chlorine!

These are instances—very rare ones—where a popular name is distinctly preferable for popular usage to a scientific one. No confusion arises when Silver Firs and Spruces are talked about any more than when calomet and corrosive sublimate are mentioned. Hence, in this particular case and in catalogues for popular use it would seem to be wise to adopt the name that leads to least confusion and to allow the botanists to follow their own devices in accordance with their rules of nomenclature.

— ANDRÉ LEROY.—A recent number of the *Pantheon de l'Industrie* contained a portrait and an appreciative biographical sketch of the late ANDRÉ LEROY, the author of the incomparable *Dictionnaire de Pomologie*, and the founder of the celebrated nurseries at Angers. LEROY was born in 1801 on August 30, the day allotted in the Romish Calendar to the *St. Fiacre*, the patron saint of gardeners—a happy prognostic truly. LEROY died in 1875, but the establishment has been carried on in its old lines by MM. EUSTACHE and HENRI DESPORTES. In the vast establishment near Angers are now grown 150 kinds of Plants, 475 kinds of Vines, 219 sorts of Rhododendrons, 600 varieties of Apples, and 900 Fears. Roses occupy an area of 5 hectares, and comprise 1500 sorts.

— PLANT DISEASES.—It is announced that a series of three lectures on the "Diseases of Plants, with special reference to Agriculture and Forestry," will be delivered before the Society of Arts by T. L. W. THUDICHUM, M.D., on the following days:—January 24, 31, and February 7, 1887.

— MEETINGS OF THE ROYAL HORTICULTURAL SOCIETY IN 1887.—The Council, and the Scientific, Fruit, and Floral Committees will hold their meetings on the Tuesdays given below:—January 11, February 8, March 8 and 22, April 12 and 26, May 10 and 24, June 14 and 28, July 12 and 26, November 8, December 13. The Fruit and Floral Committees only meet on August 9 and 23, September 13 and 27, and October 11 and 25.

— THE BERLIN GARDEN.—The *Jahrbuch der K. Botanischen Gartens* has reached its fourth annual issue under the editorship of DR. EICHLER, GÄRCHER,

and UREAN. It is an 8vo volume, containing little or no information as to the garden itself, but comprising several papers of scientific interest. Dr. FISCHER of

paper on the relation between insects and flowers as observed in the Botanic Gardens. Herr WENZIG publishes a monograph of Oaks. Herr SCHUMANN

— LINNEAN SOCIETY OF LONDON.—The next meeting will be held on Thursday, December 2, when the following papers will be read:—1, "On the Lock Leven Trout," by Dr. FRANCIS DAY; 2, "HERMANN'S *Ceylon Herbarium* and LINNEUS' *Flora Zeylanica*," by Dr. H. TRIMEN; 3, "New Species of *Brachyonychus*, from Mergui," by Mr. HENRY W. BATES.

— CAMELLIA.—Now that the *Chrysanthemums* are on the wane we are beginning to look to another Chinese product, the *Camellia*. We hear occasionally people speak of *Camellia*, but the real name was *Camelli*, with *Camellus*, *Camel* or *Kamel* as *aliases*. He was born, according to a statement by Father PAQUE, at Brunn in Moravia, in 1661. He became a member of the Order of Jesuits, and passed a large part of his life as a missionary in the Philippine Islands, where he died on May 2, 1706. At Manila he established a free dispensary for the relief of the indigent and sick, and entered into communion with RAY and PETIVER. In the Philippines CAMELLI made rich collections and many drawings. These drawings are now in the possession of the Jesuit College of Louvain, to which they were presented by Count ALFRED LIMMINGHE, who bought them at the sale of A. L. DE JUSSEU. The eminent French botanist attached much value to these drawings of CAMELLI, and attached many notes and comments to them. The drawings of CAMELLI are said to be so beautifully executed as to resemble engravings rather than pen-and-ink sketches. The botanical plates amount to 257 in number. These plates were originally intended to illustrate an appendix to RAY'S *Historia Plantarum*, but which intention was not carried out for financial reasons.

— GYNERIUM JUBATUM.—An inquiry was recently made about this plant in our columns, which leads us to cite what M. ANDRÉ says about it in a recent number of the *Revue Horticole*. The plant was collected on Chimborazo by ROEHL, and sold under the name of *G. jubatum* by M. V. LEMOINE, of Nancy. M. ANDRÉ himself found *G. jubatum* wild on the high plateaux of Ecuador, 2800—3400 metres above the sea-level, where it formed loose tufts with flower-panicles 2-4 metres high, with slender reddish-grey panicles. Elsewhere it formed tufts of lofty stature and with inflorescence very different from that of *Pampas-grass*. Hence there are probably several varieties of it.

— DRUGS AND THEIR SOURCE.—The paper of Mr. E. M. HOLMES, read at a meeting of the Pharmaceutical Society, and reported in the last number of the excellent Journal of that Society, increases our regret that so little comparatively was done by the Royal Horticultural Society to avail itself of the opportunity offered by the late Colonial and Indian Exhibition. Surely the cultural interest of the Exhibition was in no wise inferior to the pharmaceutical, and yet, with the exception of the fortnightly shows, which were very good in their way, little or nothing was done to show the vastness of the interests bound up with plant-culture in the various Colonies. Regrets are now unavailing; but when we read Mr. HOLMES' paper, and the comments it elicited from Dr. WATT, Mr. BOSISTO, and other Colonial Commissioners, we cannot but feel that a great opportunity was only very partially utilised at the Horticultural Society.

— GRANADILLA AND TREE TOMATO.—In Covent Garden Market may now be seen fruits of the tree Tomato, *Cyphomandra betacea*, labelled as *Granadilla*, which is an error, as that name applies to the fruit of the Passion-flower. The fruit of the tree Tomato is cooked and made into a kind of jelly. It was highly recommended by Mr. MORRIS when in the West Indies, but it does not find so much favour in India. We believe the market is supplied from the Azores.

— MANCHESTER HORTICULTURAL IMPROVEMENT SOCIETY.—At a meeting of this Society on Wednesday, November 17, Mr. BRUCE FINDLAY, the President, being in the chair, a paper on the *Chrysanthemum* was read by Mr. WM. NIELD. The President, Messrs. LUNT, BENNETT, J. S. BUTLER-WORTH, W. B. UPHORN (Secretary), and WILLIAMS took part in the brief discussion which followed the reading of the paper. The syllabus of the work of the Society for this session was placed in the hands of the members. Mr. BOOTH will speak about

FIG. 134.—CLERO DENDRON NUTANS: FLOWERS WHITE. (SEE P. 694.)

Berne contributes a monograph of the Phalloideæ, not so obnoxious in the pickle-bottles of the museum as they are in the garden. Dr. LOEW furnishes an elaborate

writes on the morphology of Byttneriaceæ; and other writers discuss various points of systematic and morphological botany.

Chicago, its parks and boulevards; Mr. ABRAHAM SPANFIELD will offer some suggestions as to the best town trees; Mr. PRICH will have something to say about fruit trees, their selection and culture; Mr. BIRKENHEAD will give a few thoughts on Ferns and their culture; Mr. FORRESTER and Mr. CASHELL will address the members on some of our common insects and garden aquatic plants respectively; Mr. E. G. HUGHES will speak about horticultural manures; and at the final meeting of the session Mr. BUTTERWORTH and Mr. HADFIELD with read papers on the "Fertilisation of Plants," and "Clay Soils and their Improvement," respectively.

— THE IMPERIAL INSTITUTE.—We glean from the *Times* of November 13 that as a result of the meetings which have been held of the Prince of WALES' Committee on the proposed Imperial Institute, of the Colonial representatives, and of the Exhibition Commissioners, though the QUEEN will lay the foundation stone of the Imperial Institute next June, it will probably not be opened for three years, as it will take at least that time to get the buildings ready. It has been decided that the Exhibition will not be re-opened next year in any form. Most of the Commissioners are rapidly dismantling their Courts and returning exhibits, as they could not be left in sheds for three years. If possible, the buildings lying between the new public offices in Whitehall and Great George Street, Westminster, which belong to Government, will be pulled down, and the Institute established there. It is suggested that the Colonies should occupy the ground-floor, and the mother country the floor above, the Agents-General also being located in various parts of the buildings, which will have an area of 400,000 square feet. In this case the City scheme will be united with the Prince's. If this ground cannot be obtained then a purely exhibitional arrangement will probably be made at South Kensington, and a commercial museum in the City. It is understood that none of the present Exhibition staff will be retained. The estimate of the cost of the building is £300,000.

— CHRYSANTHEMUMS AT EXETER.—A fine display of these plants is being exhibited at Messrs. LUCOMBE, PINCE & CO.'S nursery, Alphington Road. The plants, 500 in number, occupy a house to themselves, and are excellent specimens of good culture.

— TOMATOS.—A recent *Bulletin* of the Agricultural College of Michigan contains a comparative account of seventy-six varieties of Tomato grown in the College garden. Mr. BAILEY, the Professor of Horticulture, advertising to the necessity of determining the synonymy of these and other cultivated plants, says:—"None are so well qualified to undertake this work as many of our seedsmen, and it seems strange that they should be the very ones who make the work necessary. The time can certainly not be far distant when the most popular seedsmen will be those who exercise the most care in excluding novelties and unnecessary varieties."

— OENOTOGLOSSUM CRISPUM.—Messrs. VEITCH send us a flower of this plant with five sepals and five petals, while the lip and column present no unusual features. Probably the abnormality arises from the union at a very early stage of two flowers, and the consequent obliteration and non-development of some of the parts. The flower was grown in the garden of D. TOB, Esq., Eastwood Park, Glasgow.

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—At a meeting of the committee held on the 18th inst., HARRY J. VEITCH, Esq., of Chelsea, was unanimously elected Treasurer of this Institution, in the room of EDWARD TIDSWELL, Esq., who has resigned that office on account of serious ill-health. At the same meeting it was determined to make an addition of ten pensioners to the list, six of whom will be admitted without election under Rule 6, they or their husbands having been subscribers for fifteen clear years. An election will take place for four pensioners out of a body of seventeen selected and approved candidates. The voting-papers will be issued on or about December 16.

— WHITE TRUMPET DAFFODILS.—We have received the following notification from a well-known grower of the Narcissi, whose *nom de plante* is "Daffidowndilly":—"Being an enthusiastic lover

of White Trumpet Daffodils, and seeing such a quantity of notes on the subject lately in the garden literature of London, I am willing to offer a prize of five guineas at one of the April shows at South Kensington for the best stand of eighteen sorts, in quantities of not less than three of a sort—the competition to be confined to private growers."

— RATES AND TAXES.—American nurserymen, it is alleged, cannot understand why their British colleagues should complain about being over-rated. Americans are not quite so modest, but perhaps they do not realise that taxes follow on this sort of appreciation on this side of the Atlantic.

— MADAGASCAR.—Captain S. PASFIELD OLIVER'S recently published work commences with a clear historical sketch of the principal events which have occurred in Madagascar since the time when the island first became known to Europeans. The geography and topography of the Malagasy dominion are fully treated of, both physically and politically; whilst the principal routes which have been traversed by explorers and missionaries are followed and described in detail, with all the procurable information of the localities and their resources. A large general map of the island, containing many hitherto unpublished details, has been especially constructed to illustrate this portion of the work. The climate, pathology, and natural history, including the agricultural and native produce of the country, occupy several chapters, together with notices of the geology and mineralogy of those areas which have been examined scientifically, including the lately discovered auriferous districts. The most accurate information is furnished of the population, the tribal divisions, and the inhabitants of various districts. The character, language, religion, and education of the people are also discussed. Other sections are devoted to the government of Madagascar under the Hova supremacy, the internal administration, and the civil, ecclesiastical, and military systems. The manufactures, arts, and native industries of the several provinces are described, accompanied by authentic statistics of trade from official documents. Authoritative notices of the currency, weights, and measures used in the island give our merchants valuable information.

— NATIONAL HORTICULTURAL SOCIETY OF FRANCE.—On Thursday last a meeting of the Society was held to distribute prizes to gardeners for long and faithful services; to the authors of various reports; to exhibitors at the Society's shows, and others.

— ISLE OF WIGHT CHRYSANTHEMUM SOCIETY.—The annual show of this Society, which was held in the Drill Hall, Newport, on Nov. 16 and 17, was a good exhibition, and appreciated greatly by the numerous visitors who attended. In the nurserymen's classes there was but a small competition, but the cut blooms and groups were very praiseworthy. Messrs. H. DROVER & SON, Ventnor, and Messrs. GOULD showed well in the nurserymen's and open cut bloom classes. Mr. GASK and Mr. PAY also took prizes in the leading classes. Messrs. DIMMICK & SONS staged a good collection of fine blooms (not for competition). Groups were best shown by Messrs. W. MORRIS, G. INGRAM, and E. PAY, who received prizes in the above order.

— [J]ERMIER GENERAL ANALYTIQUE.—We understand that under this title M. BUYSMAN, of Middelburg, Holland, is publishing at a low price an interesting herbarium, showing prominently those parts of the plant which are important in determining its species. Each species is represented by:—1st, analyses, on a sheet of herbarium paper, of the organs which are not destroyed by drying; 2d, sections, preserved in alcohol, of the fleshy and other organs, which may be examined by a hand magnifier or simple microscope, in the tube in which they are sent out; 3d, fruits and seeds. (Fleshy fruits are also preserved in alcohol.) M. BUYSMAN states that "economic" plants form the chief part of his herbarium, which is published in two divisions relating to tropical or non-tropical plants respectively; the tropical species are collected in their native habitats, the others also in their native regions or from M. BUYSMAN'S garden. Subscribers may take, as they may wish, medicinal, economic, commercial, agricultural, or ornamental plants, or Ferns, &c.

— PUBLICATIONS RECEIVED.—*Holly Leaves, the Christmas number of the Illustrated Sporting and Dramatic News*, 1886. (London: 148, Strand, W.C.)—*Agricultural Returns of Great Britain, &c.*, 1886. (London: EYRE & SPOTTISWOODE.)—*Plant Food*. By EDMUND TONKS, B.C.L. (Birmingham: CORNISH BROTHERS, New Street).

— GARDENING APPOINTMENTS.—Mr. B. BOOKER, Foreman at Bicton, Devon, has been appointed as Head Gardener to Lady PROTHEROE SMITH, Tremowah, Cornwall.—Mr. THOS. VEVE, Gardener to the late Miss EVANS, of Darby House, Derby, has been appointed to succeed Mr. MILFORD (deceased), as Head Gardener to T. W. EVANS, Esq., M.P., Allestree Hall, Derby.—Mr. WOODWARD has succeeded Mr. C. HAYCOCK as Gardener to ROGER LEIGH, Esq., Barham Court, Maidstone.

PLANT PORTRAITS.

- ALOCASIA MARGARITE, *Illustration Horticole*, t. 611.—A Javan species, with heart-shaped bronzy leaves on long reddish-brown stalks.
- ALYSUM MONTANUM, *Garden*, October 9.
- ANGRUCUM FUSCATUM, *Rchb. l., Gartenflora*, November, t. 1234.
- BIGNONIA PURPUREA, *Garden*, October 23.
- CALTHA LEPTOSEPALA, *Garden*, October 9.
- CATTLEYA GASKELLIANA, *Illustration Horticole*, t. 613.—A form like *C. Mossii*, but differing in the flowering period and in the paler colour of the flower.
- CYTRIFOLIUM COSCOLOR, *C. GODEFROYE-NIVEUM, Revue de l'Horticulture Belge*, November.
- LESCHENAUZIA BAXTERI MAJOR, *Revue Horticole*, October 16.
- PANDANUS AUGUSTIANUS, *Illustration Horticole*, t. 612.—A species with long lanceolate serrulate leaves, but which at present affords few points by which it may be discriminated.
- RHODODENDRON YEOENSE, *R. LEDIFOLIUM, Gartenflora*, t. 1233.

Notices of Books.

Food Grains of India. By A. H. CHURCH, M.A. Oxon, F.C.S., F.I.C. (Published for the Committee of Council on Education, by Chapman & Hall, London, 1886.)

"The present handbook," Professor Church says in his preface, "has been prepared mainly with the object of furnishing to Indian officials and to students of Indian agriculture, a compact account of the alimentary value of the chief food grains of our Eastern Empire." How well the task has been accomplished, will be proved by a careful study of the work. The mere mention, however, of Professor Church's name is a sufficient guarantee for the accuracy of the analyses contained in the book. We cannot, therefore, criticise a work that is excellent both in its arrangement as well as in the matter of which it is composed. A few extracts will, therefore, serve better to indicate to our readers what the nature of the book is, and what is its value, than any words of our own. We may perhaps say, however, that the title does not clearly indicate the scope of the work, for it is by no means confined to a consideration of food grains; the largest portion is, indeed, given up to cereals, but the pulses or leguminous seeds, and others, occupy much space. In the first part Professor Church treats of "the constituents and uses of Food." In part 2, "Dietsaries and Rations" are considered, and a great deal of valuable and interesting matter is here given upon the relative value, as food, of several well-known Indian grains and seeds. This is a matter, however, upon which space will not allow us to dwell, as it is the remaining parts of the book with which we are more especially concerned.

Referring to the presence of oil or fat in the cereals, Professor Church says, "Some of this, often a good proportion, resides in the coats of the grains, and in the embryos or 'chits.' When, therefore, Wheat grain is decorticated, and especially when, as in some modern processes of milling, the embryos are removed, the percentage of oil is much lowered. This will be obvious when we state that the embryos contain 141 per cent. of oil and the different grades of bran from 21 to 5, the whole Wheat grain not showing more than 2 per cent. Maize and Barley are richer in oil

Rice very poor. In actual dietaries this deficiency of oil or fat is made up in several ways. Where fish or flesh meat is employed a good deal of oil or fat is introduced therein, but the very common use in India of milk or of some preparation from it, effects something in the same direction; expressed fatty oils are also extensively employed."

By far the largest portion of the book is devoted to the consideration of the food-yielding plants, under three separate and distinct heads, the grasses naturally taking the lead, the genera being arranged in their proper tribes and in proper sequence. The plan adopted with each plant is similar to the following which is quoted as an example:—

"RAGI.

"*Eleusine coracana*, Gartin.

"Hind.—Natchoi, Nachani, Nagli, Madna, Maruya. —Beng.—Marua, Modua. Oudh.—Mindua. Punjab.—Mandal, Chalodia. *Punjab and Bengal Hills*.—Koda, Kodom. *Himalaya*.—Koda. *Bengal and South India*.—Ragi. *Tamil*.—Kayuru. *Telugu*.—Kawaru, Sodi, Ponsa. *Sinhalese*.—Puta-tamba, Kurakka. *Sanskrit*.—Rajika.

"This semi-erect to decumbent native grass belongs to the tribe Chloridee. It is a fairly productive rainy-weather crop for light soils; it may be grown almost upon stones and gravel. It yields from 15 to 6 maunds of grain per acre upon the hills, 12 to 4 maunds in the plains if carefully cultivated and weeded. It is the staple grain of the Mysore country; sometimes it is stored in pits and will keep good for years. It is frequently grown with summer rice, ripening sooner, and thus affording earlier relief in times of scarcity; the straw is used as fodder. *Eleusine* agyppica, a closely-allied species found wild on the road-sides of the Punjab and North-West Provinces, and indeed throughout Upper India, yields a poor unpalatable grain, which in times of scarcity is occasionally collected and eaten. This species is common in the warmer parts of Ceylon.

Composition of Ragi.

	In 100 parts.		In 1 lb.
	Hu-bled.	Whole.	
Water	13.2	12.5	2.9
Albuminoids	7.3	5.9	0.43
Starch	73.2	74.6	11.49
Oil	1.5	0.8	0.16
Fibre	2.5	2.0	0.152
Ash	2.3	3.6	0.232

"The nutrient ratio is here 1:3, the nutrient value 84. The percentage of phosphoric acid in the whole grains is about 0.4.

"Generally, this Millet is sold at a cheaper rate than any other; in some places in ordinary seasons 130 to 140 lb. of it are procurable for about 2s., and it is looked upon as a famine food to which recourse is had only in times of drought or of deficient crops. Ragi is, however, commonly used in some districts, as by the poorer and lower classes of Patna division, also in Bhagalpur, Santas Parganis, Dinapur, and Gorakhpur. It is more esteemed than Maize by the natives of Patna and Behar, but it is not, in general, a popular food, being considered difficult of digestion, productive of flatulence, and astringent. It is much less esteemed than Jowar and Bajra. In Turhut cakes made of Ragi flour are largely eaten. In Darjiling a fermented liquor is prepared from the grain."

The book is well illustrated by excellent figures of the plants referred to, it is well printed on good paper, and the whole get up leaves nothing to be desired.

CLERODENDRON NUTANS.

At one of the recent meetings of the Floral Committee Mr. Head, the Director of the Gardens of the Crystal Palace, startled the visitors by the exhibit of a handsome stove plant, grown in a pot, and trained to a single stem, from the summit of which depended on all sides elegant racemes of white flowers delicately perfumed. There was no doubt what the verdict of the committee would be, for every one was struck by its distinctness and beauty, and hence a First-class Certificate was voted by acclamation, subject to the verification of the name. (See fig. 134, p. 689.)

This was soon accomplished, for a reference to the Lindley Library showed that the plant was introduced in 1825, and figured in the *Botanical Magazine*, t. 3049, though it is not mentioned in Loudon's *Encyclopædia*, nor in Nicholson's *Dictionary of Gardening*. Grown either in the form shown by Mr. Head, or allowed to run over the rafters of a stove,

it would form a most ornamental plant; and when stove and greenhouse plants resume their place on the exhibition table, this should form one of the most effective of them. It is a native of the Eastern Himalaya, Ava, and Chittagong. A full description of the plant is given by Mr. C. B. Clarke in *Hook. Flor. Brit. Ind.*, vol. iv., p. 591 (1835).

TRADE NOTICES.

GOOD NEWS FOR ENGLISH ROSE GROWERS.

There is a statement in an American exchange to the effect that English Roses can be sent to America, and that in spite of freight, customs' duties, and incidental expenses, the roses cost the recipient less than is demanded for plants of the same description in the States, while no American dealer offered so choice and extensive a list from which to make a selection as the English one.

ICHTHEMIC GUANO.

Under this name, a soluble form of dry manure was exhibited at the Aquarium on the occasion of the late Chrysanthemum show. It has long been in use amongst farmers, and is stated to be suited for all kinds of vegetation. We can only repeat, that it appears to be very easily soluble, and has a strong smell, indicative of the presence of a considerable amount of ammonia. The following is the certificate of analysis:—

"We have carefully examined a sample of Ichthemic Guano, and find the result to be as follows:—Phosphoric acid, 5.11 (equal to tribasic phosphate of lime, 11.17; nitrogen, 8.55 (equal to ammonia, 10.79). (Signed) *Chemist & Analyst, Analytical Laboratories, 18 and 19, Leathard Street, E.C., July 20, 1886.*"

AWARD AT THE LIVERPOOL EXHIBITION FOR METHODS OF VENTILATION.

Messrs. W. Richardson & Co., Darlington, inform us that they have been awarded a Silver Medal (the highest prize in this department) at the International Exhibition, Liverpool, for their patent system of ventilation for horticultural buildings, and the general excellence of their exhibits.

A CORYLUS GONE WRONG.

The male flowers of this genus, to which the Hazel-bell belongs, are arranged in catkins. Each flower consists of two usually small bracteoles placed laterally one on either side of a group of eight stamens, the whole nestling within the axil of short concave bract. As a rule, only this latter is visible without the aid of needles and pocket lens, but in the specimen before us the two usually concealed bracteoles are present in a highly developed form as spreading more or less toothed leaves. When we first received the specimens from M. van Volxem we experienced a momentary feeling of great expectation that we might have here, on the same catkin, male flowers and female, the baby appendages having much of the look of the involucre or "beard" of the Filbert. Any such expectations, however, were dispelled by the touch of the needle point, by which means the real nature was speedily made apparent. M. van Volxem thinks the overgrowth of these bracteoles may have been due to insect punctures. Possibly, we, too, suspected mites (Phytoptus), but we could not find any. (See fig. 135, p. 692.)

GARDENING IN DÜSSELDORF.

We are authorised to publish the following extract from a Foreign Office report, forwarded to Kew, by Mr. T. R. Mulvany, on Westphalia, for the year 1885:—

The market (fruit and flower) gardeners, who represent a very considerable industry in this neighbourhood, have suffered much under the general depression of prices, and by the increased importation of such products from Holland, Belgium, France, and Italy, with which countries they find it difficult to compete, even on their own ground, partly in consequence of climate, partly from want of knowledge and experience, especially in the cultivation of fruit and flowers. However, during the last few years, in the latter respect, they have made considerable progress; some fruit and flower shows got up lately—quite a new institution—were rather successful, though it has been hinted that a large proportion of the flowers were imported.

DISEASE OF THE VINE AT DÜSSELDORF.

The disease of the Vine has not made any very dangerous progress; the rules and regulations to prevent the importation of diseased plants of any sort are very stringent, and rigidly adhered to. Plants of any sort can only be imported from those countries which are in the convention for preventing the spread of the disease, therefore all importation from Great Britain is excluded. I know a case in point: a valuable collection of plants and bulbs from Ireland, although tested in Holland, having been refused admission into Germany, had to be sold in Holland, although there was not a single Vine plant amongst the lot.

PRIMULA REIDI.

When the Primrose Conference was first broached application was made to various botanists in India and elsewhere for seeds, &c. Among those who kindly responded was Mr. Duthie, of the Saharunpur Botanic Garden, who sent, among other things, seeds of the species discovered by him on his excursion to the mountains of Kumaun. An account of this excursion was given in the annual report of the Saharunpur Botanic Garden, where a new species called *Primula Reidi* is for the first time described. This description was transferred to our own columns February 6, 1886.

A short time since Mr. G. F. Wilson, Weybridge, brought up to the Floral Committee a plant of this species, which he had succeeded in flowering. The plant, though small and undeveloped was evidently such a gem that we immediately sought permission to engrave it even in its present state, in order to let Primrose growers know what is in store for them. Miss Wilson was kind enough to furnish us with the drawing, which tells its own tale (fig. 136). All that we need say is, that the flowers are ivory-white, and we look forward with eager expectation to the results of cultivation upon so lovely a plant.

HOME CORRESPONDENCE.

New Varieties of Hyacinths.—I do not wish to be misunderstood on this question, and beg to say that I have grown and know all the varieties named by Mr. Kerstein. I exhibited *Sauveur de J. H. Veen* in my first prize group last year. It is the very best of the new varieties; this opinion of it I have held from the first year it was grown in England, and the first impression has been abundantly confirmed every year. When I said it was too popular, I meant that the Dutch growers were likely to have before they arrived at their most perfect development, and from the size of the bulbs of that particular variety, which are considerably smaller than they were last year, I greatly fear this is the case. I have grown *Saltan* and *Electra*, and have them again this year; but I fear the spikes are not long enough to place in a collection of twelve. I have rejected scores of new varieties because they do not come up to this standard; and it says much for the excellent qualities of J. H. Veen that we have adopted it to the exclusion of many promising varieties, which have been honoured with First-class Certificates. *J. Douglas.*

Conservatory Climbers.—Your esteemed correspondent, Mr. Earley, last week wrote of the ill effects of close pruning Abutilons. In the conservatory here *Abutilon* *Boule de Neige* and a yellow variety grow most vigorously planted out and cut back close annually. Shoots from 8 to 10 feet long are produced which bloom profusely for several months up to Christmas, and form splendid pillar plants. *Lacalia grattisina* is one of the very best plants for a pillar where fully exposed to the light. Cut back pretty freely in January it has now opened the first head of deliciously sweet-scented pink flowers, and for the next six weeks it will be very attractive. As a pillar or wall plant it has few rivals at this season of the year, but it is not valuable as a cut flower. *Solanum jasminoides*, grown on pillars 20 feet high, arched over a broad walk, with shoots 12 feet long hanging down, thinly trained, have a singularly charming effect amongst other plants, such as *Fuchsia*, but not on the same pillar. The flowers are not so attractive in general, but as grown here, suspended high, they are interesting. *Cianthus puniceus* is another useful shrub—vigorous, and the foliage gives variety. It blooms during January and February, and is very attractive at that season. It is rather subject to red-spider, which we keep down by syringing. *Bougainvillea glabra*, if required for autumn use, may be

stopped twice, and will then bloom on to Christmas; but if grown in a stove it will flower more than half of the year. All the above plants are close pruned. *Bignonia Chirite*.—In August, 1885, I called at the Denbies Gardens, Fording, and the gorgeous display of flower produced by a plant of the above. I shall not soon forget it. I would call special attention to this plant, as it is not so commonly known as it deserves to be. I am led to think that the plant does not bloom freely in a young state, but it is worth years waiting for. It requires a large space to grow them effectively. *Bomarea*.—I have had *Bomarea conferta* highly recommended as a pillar plant, but after two years' trial with vigorous growth it does not seem disposed to bloom freely, and the winding habit of the shoots and lack of branches up the stem bearing flowers disqualify it for furnishing pillars, where a general display is sought from top to bottom. This plant requires special treatment I presume—possibly a dry warm atmosphere to mature the shoots. *G. Harris, Almeida Castle Gardens.*

The Gardeners' Royal Benevolent Institution.—As there have been a great many collections in the churches of this country in aid of the Agricultural Benevolent Institution, I venture to express a hope that the clergymen of our churches will think of the Gardeners' Institution one day next year, say Easter Sunday, when the churches are all aglow with cut flowers and pot plants, the produce of the gardener's skill; and as gardeners have contributed many times to the Agricultural Benevolent Institution I believe the farmers, &c., will give their twin sister Institution a turn. *John Perkins, The Gardens, Thornham Hall, Suffolk.* [A good suggestion. Ed.]

Hautbois Strawberry ("P. F. R.," p. 631).—I shall be pleased to let the enquirer have some young plants of the above Strawberry if he will send me his name and address. *H. W. Ward, Lenford Castle, Salisbury.*

Bellicide, or *Daisy Eradicator*.—This is an entirely new preparation, in course of distribution by Messrs. Hurst & Sons, wholesale seedsmen of 152, Houndsditch, E. Up to this time Watson's Lawn Sand has been the most prominent of the agencies recommended for killing weeds on lawns, but the high price at which it is sold makes its use almost prohibitory. This new preparation, while equally efficacious, is much less expensive, and therefore it is better adapted for general use. It not only destroys Daisies, but other weeds, and the first application of it I saw was at Duncorn, Sturtham Hill, the residence of N. Sherwood, Esq. Here it had been freely applied, with the result that hundreds of large weeds were destroyed. The *Bellicide*, being in the form of a dry powder, is applied by means of a small dredger, and is carefully distributed over the whole surface of the weed operated on, when it soon withers up. The preparation may extend to the grass around the weeds, and slightly burn it, but there is in its composition something that fertilises the grass also, and if the spot be watered, suppressing the weather if dry—a rich growth of green verdure will ensue. The *Bellicide* has been largely used by Mr. J. Roberts on the lawn at Gundersby Park, Aetou, during the summer; it was applied both in shady positions and those fully open to the action of the sun, and in every case the results proved highly satisfactory. It there destroyed the leaves and crowns of the Daisies and other weeds, doing it completely. It slightly affected the appearance of the grass, but was quickly followed by a luxuriance of growth that Mr. Roberts describes as truly astonishing. Mr. Robert Greenfield, of the Priory Gardens, Warwick, reports that he has tried it "at different times, and each time with the same successful results. It completely kills Daisies, Dandelions, Plantains, &c., while at the same time it acts as a manure to the grass, as the latter grows vigorously after its application. I find it most effectual when applied in moist weather." Mr. G. Dixonham, The Gardens, Brickhill Manor, Bletchley, who has also tried the *Bellicide* with the best results, reports as an important fact that "it gets rid of the moss which is almost as objectionable as the Daisies, &c.," and he forwarded for inspection "a small quantity of moss taken from a hard gravel walk in a damp and shady position, which was quite killed by applications of the *Bellicide*, leaving the walk bright and clean." Applications made on the lawn of the Imperial Hotel, Great Malvern; at the Hollyroech Hotel, Colwyn Bay, and several others duly recorded, show equally satisfactory results. In the case of larger plants of weeds it is necessary to have the crowns cut off before the preparation is applied, which should be done direct to the stem; three or four dressings may be necessary to the very strongest, but in the end the weeds succumb. If applied during dry weather water should be given five or six days afterwards. The *Bellicide* can be used at any time between March and August, and there is nothing injurious about it; it does not harm

birds, nor anything except the weeds it is intended to exterminate; moreover, it has no objectionable smell, and will keep any length of time, but it is necessary to store it in a dry place, as some of the ingredients may absorb moisture, thus rendering it difficult to apply, besides interfering with its equal distribution. The preparation has been made with the greatest care, and there is no doubt it will be found a great boon to gardeners generally. *R. D.*

Orchid Pruning.—A note under this heading in the *Gardeners' Chronicle* of the 13th inst. seems intended as a "fling" at the advocates of the "pruning system." It is evident, however, that the writer has not read all that the advocates of the system have recommended in these pages, or he would have discovered special reasons for not pruning out the old growths of many species of *Dendrobiums*. So far as my humble opinion goes, and according to the rules I ventured to recommend, he is justified in retaining the old growths of the species he mentions until he is quite certain they are flowered out. My only reason for writing this, is to vindicate the system, for every year's experience proves to me that it is founded upon sound principles. *N. Blandford.*

Wasps and their Habits.—Wasps have frequently strange places where they select to build their nests to form their colony of young in. Perhaps one of the most common resorts is in the ground, by taking pos-

squeezing it tightly with their flattened mandibles. This is rapidly repeated three or four times before taking flight for another supply. In warm favourable seasons for their increase, nests are often found from 6 to 8 inches in diameter; only a few were seen here this autumn, although they were in great numbers in the spring months. Two or three are the most I have seen, one being in the mouth of a dolphin, one of three supporting basins of a fountain which was dry for some time early in the summer, when the mother wasp had taken possession. It was an amusing sight to see the young wasps flying in and out through the falling spray, and seemingly taking no more notice of it than if it was only a shower of rain falling; the sight being a novel one I did not have it destroyed. It is commonly understood that all the wasps seen early in the season are females, fertilised in the autumn before leaving the parent nest, and getting into their dormitory. If such is the case, and all that are seen were to become transformers of a colony, would, in a favourable season, for their breeding literally be eaten up. From a number of years' observation, I now look upon the great numbers in spring as an indication of having few in autumn. I have also noticed the opposite, viz., they are most plentiful in the autumns succeeding springs when few are seen. I have paid for killing at the rate of 1s. per dozen to spring, and left it off a number of years ago, but my next finding it made any difference, but I am an advocate for destroying all nests in early life before they get abroad to search for their winter lodgings. I have occasionally found them in winter concealed under thatch and under decayed bark of trees, &c.; cold in this stage does not affect them in the least provided they are kept dry. *J. Webster, Gosdon Castle.*

Begonia socotrina Flowering from the Bulb.—Under ordinary circumstances bulbs, or what must be considered such from their construction, are formed around the neck of the plant, and generally close to the surface of the soil, or altogether exposed. These structures consist of a few comparatively large bract-like organs, that completely enclose a dense mass of small bodies, closely packed on a central axis. All these must be looked upon as modified leaves, while the latter kind give the structure a cone-like appearance. Terminating the axis, at least of the larger ones, are some perfectly formed but of course very small flowers, which may, but more often do not become developed during the current year. A striking exception to this is seen in the *Begonia-house* at Kew, where some of these incipient inflorescences have emerged from their narrow confinement and become developed several inches in length, with every appearance of a healthy vigour that will enable the flowers to expand. The flowers in question are borne on a naked peduncle, without the accompaniment of the ordinary petalate leaves, and leafless, save for the numerous bract-like organs around the base of the now elongated axis. *J. F.*

Heliantum tuberosum Flowering.—In a villa garden at Kew quite recently, or before being destroyed by frost, might have been seen a row of Jerusalem Artichokes with stems ranging from 6 to 8 feet high. Most of them, or at least all taller ones, terminated in a flower-bud which ultimately became fully expanded. The fishing-rod-like stems, each bearing a solitary, pigmy yellow flower, seemed remarkably odd, and shows how little, long-cultivated tuber-bearing plants depend upon the production of flowers and seed for their preservation and continuance. A few years ago the same species might have been seen flowering on the Middlesex side of the river. *J. F.*

Adiantum Farleyense.—Have any of your readers ever known *Adiantum Farleyense* to bear spores? I was speaking with a gardener the other day, who has a plant that he asserts sprang from a spore; it came up amongst a number of other varieties, as *A. macrophyllum*, *A. scutum*, &c., and was the only one in the batch. I was mentioning this to a gardener who grows several large plants, and he seemed to think *Farleyense* was a fertile variety; but on examining his plants no frond could be found bearing spores. If it does not spore, how is the first man's seedling to be accounted for? I have always been under the impression it was a barren sort. *W. G.*

Convolvulus mauritanicus.—In the notice of this plant by Mr. Earley, at p. 661, he speaks of it as a pot plant, to be wintered in a greenhouse, even if planted out in summer. For many years I have grown it on a rockery, and it has stood the winters unprotected, including some of the most severe seasons, without the slightest injury, increasing in size until it has grown into a plant a couple of yards across, bearing hundreds of blooms. It is readily raised from seed, sown under glass in early spring. I am surprised it is not more generally grown. *E. Harvey, Aigburth, Liverpool.*

FIG. 17. HALF FLOWER OF *COLEUS BOLDII*, WITH LEAFY BRACTEES, ENLARGED. (SEE P. 694.)

session of a deserted mouse-hole, or something similar; and should it be as common to see them attached to branches and in the form of wall tufts, shrubs, hedges, and such-like, and occasionally upon branches of forest trees, even in exposed, airy places. Whether these are different kinds of wasps, or only vary in their resort, I am not able to decide, but the form and material of building their nests are precisely similar. It is worthy of remark that there are never any of these hanging nests seen in the South of England, where wasps are plentiful enough, and are invariably in the ground, or in places where their nests are not seen. We have here another kind by no means common, which is not only different in appearance to the common sort, by having broader bars across the back, and is somewhat darker and smaller in size; but the habitation selected is generally under hovels and under roofs of houses for rearing their young, and the paper-like casings of their nests is in stripes, and worked round like scallop shells, and is pretty in appearance. It is very interesting to watch them building their hanging nests, on the thin paper walls of which there is a number of sections or layers surrounding the outside walls; the material used being collected by the wasps from old pailings or decaying stumps of trees, and the process of building, which I have repeatedly watched, is done by placing themselves over the section they are increasing, and working rapidly backwards, exuding at the same time the gummy looking substance out of their mouth, and

Reports of Societies.

EDINBURGH BOTANICAL: November 11.

(Concluded from p. 664.)

REPORT ON VEGETATION AT THE ROYAL BOTANIC GARDEN, EDINBURGH.—The month of July was rather cold and wet for the season of the year. Rain fell more or less on sixteen days. A few really warm dry days occurred during the first week, after which showers and dull weather occurred frequently till the end of the month. The lowest night temperature was 38°, which occurred on the 27th, and the highest 52°, on the 2d. Herbaceous plants and annuals flowered remarkably well. Roses were also good during the last week of the month. On the rock garden 282 species and varieties of plants came into flower during July, amongst which the following were conspicuous:—*Heuchera sanguinea*, *Cyananthus lobatus*, *Saponaria caspitosa*, *Cactalia alpina*, *Mycosotis capitata*, *Tropaeolum polyphyllum*, *Meconopsis Wallichii*, *Phyteuma comosum*, *Pentstemon speciosum*, *Epilobium obovatum*, *Chrysogonum virginianum*, *Aristolochia rotunda*, *Spiraea distichoides*, *S. bullata*, *Lilium Kramerii*, *Galium rubrum*, *Calochortus pulchellus*, *Micromeria piperella*, *Veronica amplexicaulis*, &c.

During August the weather was fairly good; there

were species of Maple, Oak, and Liriodendron, while many others were scarcely coloured at all, the leaves having fallen or been blown off in an immature condition. The brown tints which many Conifers assume at this season are as yet absent. Want of heat and sunshine during the growing season, causing insufficient ripening, appears to have brought about this result, and from the same cause Rhododendrons, Azaleas and other Ericaceous plants are but poorly set with flower-buds for next year. Fruit bearing trees and shrubs have, as a rule, produced moderate crops: the best are Hollies, Cotoneasters, Roses, and *Prunus lusitanica*—the latter is unusually abundant this season.

The lowest readings of the thermometer occurred on the 9th, 34°; 11th, 33°; 13th, 37°; 22d, 35°; 23d, 32°. The highest morning readings were—on the 1st, 59°; 2d, 56°; 6th, 53°; 7th, 56°; 8th, 56°. Rain fell on eighteen days, and there were severe thunderstorms and violent gales at the middle of the month.

On the rock garden a large number of plants were in flower. Only sixteen, however, opened their first flowers during October, the best of which were *Armeria canescens*, *Aster longifolius*, *Crocus medius*, *asturicus*, *byzantinus*, *Schmidtii*, and *pulchellus*; *Dianthus arenarius*, *Helleborus altifolius*, *Tricyrtis hirta*. From January 1 till the end of October 1161 species and varieties have flowered on the rock garden; at the same date last year 1168 had flowered.

September was, on an average, favourable. The weather was dry, but rather cold. The first frost

light, and the weather generally conducive to a fine and continuous floral display.

The thermometer was below the freezing point once only during the month, 3° of frost having been registered on the morning of the 16th; the next lowest readings were 33° on the mornings of the 17th and 23d respectively. The mean temperature has been slightly above the average. The prolonged dry and fine weather experienced during the middle of the month proved of great benefit in maturing crops of all kinds, and reduced the effects of what was previously considered a backward season. Seeds are generally well developed, and if the coming month should prove propitious a good seed harvest may be expected. Fruit of all kinds has been over-abundant and cheap, except Apples (in some districts).

Of outdoor flowering plants there are still a number of late-sown hardy annuals in bloom. Dahlias are at their best, having escaped the frost of the 16th, which put an end to the blooming season of *Pelargoniums*, and considerably injured such plants as *Ageratum*, *Heliotropis*, &c.

The lowest temperature registered during the month was 20° during the nights of the 21st and 22d respectively. The next lowest reading was 36°, during the night of the 23d, the highest 51°, during the nights of the 4th and 5th; the mean day temperature was correspondingly high.

On several days during the middle of the month rainy and stormy weather prevailed, but during the last ten days it has been fine and seasonable.

As was anticipated last month, a considerable number of seeds have been gathered. Dahlias are still in bloom, but owing to the advanced season the flowers are not well developed.

The blooming season of both annuals and perennials is a prolonged one, the following being still in bloom—*Anemone japonica*, *Tyrrhenum alpinum*, *Colchicum autumnale*, various *Asters*, *Calendulas*, and *Godetias*. Rhodolendrons (especially hybrids) are well set with bloom-buds. *R. Fullen*, Curator.

DEVON AND EXETER HORTICULTURAL SOCIETY: CHRYSANTHEMUM AND FRUIT EXHIBITION: Nov. 12.

THE above exhibition was held in the Victoria Hall, Exeter, and from every point of view was a great success. The quality of the flowers staged in the groups was very superior to former years, and soon we may hope to see perfection in the style of growth, quality of bloom, and arrangement. There was room for more plants, which no doubt the committee was not slow to note; and if some change in the modes of arranging exhibits could be effected it would add greatly to the appearance of the show as a whole. The cut flowers, both Japanese and incurved varieties, were shown in much greater numbers than usual, and of far superior quality. Anemone, reflexed and pompon classes, showed more entries than before, but there was much room for improvement. The fruit classes for Apples and Pears formed also a great feature, the colour showing to much greater perfection than at the earlier fruit show, and naturally seen at home in conjunction with the Chrysanthemums.

PLANTS.

Chrysanthemums in pots, not less than eighteen varieties, arranged for effect in a semicircle with an external radius of 6 feet. Ferns may be used for the front.—Four competitors. 1st, Mr. Rowland, gr. to Wm. Brock, Esq., Parker's Well House, Exeter; this was an excellent collection, including all the best varieties of Japanese and incurved, the individual flowers all being of first quality, and well merited the award. 2d, Mr. Counter, gr. to Mark Farrar, Esq., Exeter, who had lesser varieties but larger plants, with several varieties, were shown to Lady Hotham, Knightleys, Exeter, staged a group in this class which was very effective, but very small blooms.

Collection of Chrysanthemums arranged in a semicircle with an external radius of 6 feet.—1st, Mr. Milton, gr. to Mrs. Fongel, who had very tall plants and fine bloom; 2d, Mr. Rowland, whose plants were much more dwarf, but lacking in size of bloom in the outer rows. Maidenhair Ferns were used in many of the collections, which served to hide the pots of the Chrysanthemums, and to give a finish to the appearance of the several groups.

CUT BLOOMS (CHRYSANTHEMUMS).

Thirty-six Japanese, in not less than twenty-four distinct varieties.—1st, Mr. Geeson, with a grand lot of fresh blooms of leading varieties; 2d, Mr. Rowland, also with a very beautiful lot of bloom.

Thirty-six incurved, in not less than twenty-four distinct varieties.—Here again Mr. Geeson took the lead with splendid blooms of the best kinds, of good substance and fresh.

Twenty-four Japanese, distinct.—1st, Mr. Geeson, whose blooms were equal in merit to those in his first lot.

FIG. 136.—PRIMULA REIDI. (SEE P. 601.)

were nineteen dry days, and the wind was westerly throughout.

Several low night temperatures were registered. The lowest were—on the 1st, 40°; 3d, 36°; 4th, 37°; 5th, 38°; 15th, 39°. The highest morning readings were—on the 6th, 67°; 20th, 68°; 28th, 63°; 29th, 70°; 30th, 66°. Eighty-six species of plants came into flower on the rock garden during August, amongst which were the following, viz.:—*Campaula isophylla alba*, *Hypericum chinense*, *Umbilicus sempervivum*, *Erica ramulosa*, *Calluna vulgaris fl.-pl.*, *Olearia Haastii*, *Potentilla Leschenaultii*, *Cyclamen hederifolium*, *Centaurea alpina*, *Saxifraga fimbriata*, *Stactis minima*, *Digitalis ferruginea*, *Scabiosa graminifolia*, &c.

The rock garden was very gay during this month, a large number of the plants which begun to flower in July continued longer than usual, in consequence of there being no great heat. Artificial watering was also at no time required.

The past month of October has been remarkable for the absence of frost, only once did the thermometer reach the freezing point, viz., on the 23d, while in October, 1885, frost was registered on four nights, indicating 20° in all. In consequence of the mildness of the season, a large number of autumn flowers are still in fairly good condition—Dahlias, *Pelargoniums*, *Lobelias*, *Calceolarias*, and other tender plants are in flower in the open ground up to the present date, but they are somewhat battered by the severe storms of wind and rain they have undergone. Autumnal tints on deciduous trees and shrubs have been less interesting than usual. Very few have coloured well, the best

this season occurred on the morning of the 15th, when the thermometer fell to 29°, and on the following morning it registered 32°. Dahlias, and a few other tender plants were injured, but not altogether destroyed. Potatoes were also blackened in some districts. No more frost occurred during this month, the lowest readings being 35° on the 19th, and 36° on the 23d. The highest morning readings were—on the 1st, 65°; 6th, 65°; 8th, 62°; 9th, 60°; 30th, 62°.

The season has been favourable for transplanting and outdoor operations have had but little interruption throughout the month. On the rock garden twenty-four species of plants came into bloom, amongst which were *Hypericum patulum*, *Morina Coulteri*, *Tricyrtis australis*, *Polygonum capitatum*, *Colchicum maximum*, *Gladiolus Saundersii*, *G. purpureo auratus*, *Oxalis lobata*, *Polemonium flavum*, *Kniphofia MacOwani*, *Colchicum autumnale album fl.-pl.*, *Lilium tigrinum*, *Oenothera rivalaris*. *R. Lindsay*.

REPORT OF THE GLASGOW BOTANIC GARDEN.

The weather has again been variable, and generally cold, particularly at night, the last few days, however, having been warm and summer-like; the thermometer in the sun having registered 105° on the 28th, and 109° on the 29th, the latter being the highest record this year. On the same dates the thermometer in the shade registered 70° and 69° respectively.

The lowest temperatures were registered during the first week, 35° on the morning of the 3d being the lowest reading here, while a few miles away the temperature varied from 32° to 28°, or 4° of frost, many half-hardy plants being injured, and the foliage of *Halimolobos* in many districts discoloured. Lower night readings have not been recorded for many years. The rainfall in this district has been comparatively

Eighteen Japanese, distinct.—1st, Mr. F. Delve, gr. to F. W. Grant, Esq., Lymington, with a very nice lot indeed.

Twelve Japanese, distinct.—1st, Mr. Dolling, who had a very fine stand of blooms.

Six Japanese, one variety.—1st, Mr. Applin, with Madame C. Audouguer, very good; 2d, Mr. F. Delve, with Fair Maid of Guernsey, very fine.

Twenty-four incurved, distinct.—1st, Mr. Gceson, also in good form.

Eighteen incurved, distinct.—1st, Mr. Rowland, with a capital stand of blooms.

Twelve incurved, distinct.—1st, Mr. Dolling.

Six incurved, one variety.—1st, Mr. Applin, with fine blooms of Queen of England; 2d, Mr. Dolling, with Jeanne d'Arc.

Six reflexed, distinct.—1st, Mr. Dolling, with Golden and Pink Christine, King of Crismons, Mr. Forsyth, Cullingford, and Cloth of Gold.

Six Anemones, distinct.—1st, Mr. Applin, with good blooms of Fabian de Medina, M. Cabrol, Acquisition, Lady Margaret, Gruck, and Madame Borany.

FRUIT.

Three bunches Black Alicante Grapes.—1st, Mr. Iggulden, with splendid bunches, averaging 3 lb. each, good berries, well coloured, and perfectly symmetrical; 2d, Mr. R. Pike, gr. to Rev. H. Clerk, Exmouth, with capital bunches, very fine in berry.

Three bunches Gros Colmar Grapes.—1st, Mr. Iggulden, with fine bunches, and well coloured.

Three bunches Lady Downe's Grapes.—1st, Mr. Longworthy, gr. to G. F. Enmore, Esq., Exmouth.

Three bunches Muscat of Alexandria Grapes.—2d, Mr. Teed, gr. to Mrs. Ensor.

One Pine-apple.—1st, Mr. Lock, with a splendid Smooth Cayenne.

Dishes of Apples and Pears in large and small quantities were numerously shown by exhibitors hailing from Devon and the neighbouring counties.

Messrs. Veitch & Son, of Exeter, contributed several stands of Chrysanthemum blooms of good quality, and Apples and Pears in great variety.

Messrs. Lucombe, Pince & Co. showed a fine lot of Chrysanthemum plants in bloom, of excellent quality; in melon in front was a large collection of Apples and Pears in great variety. C. D. P.

DEVIZES CHRYSANTHEMUM :

November 16.

If any exhibition deserves to be a success this does, for it is an annual of the Benevolent Society of Devizes, and it is made the means (in conjunction with the annual Bazaar) of bringing in a large sum, which is devoted to the relief of the distressed during the winter months. As is usual, the exhibition was arranged by Mr. Thomas King, of Devizes Castle Gardens, who discharged the duties of manager in an admirable manner.

PLANTS.

In the Corn Exchange were to be seen some of the best plants of trained Chrysanthemums we have been privileged to look upon this season. They were large, finely grown, and well bloomed; the best six, grown by Mr. Hall, gr. to C. N. May, Esq., The Elms, Devizes, would have held their own at the Royal Aquarium Exhibition. Mr. H. Clark, gr. to C. E. Colston, Esq., Roundway Park, Devizes, was 2d, with admirable specimens also.

In the class for four plants, Mr. George Tucker, gr. to Major W. P. Clarke, Trowbridge, was 1st with capital plants; 2d, Mr. J. Webb, gr. to W. Stancomb, Esq., Blounts Court, Devizes. Mr. May had the three best specimens of Mrs. George Rundle, Mrs. Dixon, and George Glenny, highly praiseworthy in every respect.

Specimen Japanese were good also. Mr. C. N. May was again to the fore with six excellent plants in good contrasting varieties, equal in size, finely grown and flowered. 2d, Mr. C. E. Colston, with very good plants. Mr. G. Tucker had the best four.

In the class for six pompons there was a spirited competition with fine kinds. Mr. May again coming in 1st with excellent plants. 2d, Mr. Colston, close up.

Mr. G. Tucker had the best four plants grown as pyramids; 2d, Mr. Burgess, gr. to the Rev. C. E. Eastwell, Southborne Vicarage, Devizes.

CUT BLOOMS.

There was a keen competition for the Silver Cup given by the late Mayor, Mr. H. Mead, for twenty-four blooms of Chrysanthemums, twelve incurved and twelve Japanese. This was won by Mr. W. Wildsmith, gr. to Lord Eversley, Heckfield, Wichefield, with a very good lot; 2d, Mr. G. Tucker, with some remarkably good flowers, which, though nice and fresh, were wanting in size.

Mr. Wildsmith also had the best twelve cut blooms

in four distinct varieties, having fine blooms of Princess of Wales, Baron Beust, Jeanne d'Arc, and Golden Empress; 2d, Mr. F. Taggart, Old Sneyd Park (E. Miller, gr.).

In the class for twelve incurved blooms, distinct, Mr. C. N. May was 1st, with an excellent lot; 2d, Mr. W. Wildsmith, with good blooms.

Mr. May was also 1st in the class for twelve cut blooms, shown with 4 inches of stem and foliage, distinct, having excellent blooms; 2d, Mr. W. Wildsmith.

Japanese blooms were well shown, Mr. W. Pethwick having the best twelve, fine and well developed; 2d, Mr. W. Wildsmith.

There was an excellent competition also in the class for Anemone-flowered in four varieties, and here Mr. W. Pethwick was 1st, with finely developed blooms; 2d, Mr. G. Tucker, with flowers of much merit.

A very fine stand of reflexed Chrysanthemums, not for competition, was staged by Mr. Wildsmith, and Highly Commended.

The increasing popularity of the Chrysanthemum show was proved by the fact that the admission money exceeded by £10 the amount taken last year.

WEST KENT CHRYSANTHEMUM :

Nov. 16 and 17.

THIS Society held its ninth annual exhibition in the Public Hall, Bexley Heath, on the above dates. The show was a decided success, both a regards extent, the high quality of the plants and cut flowers, for which competition was invited, and which included Grapes, Apples, Pears, Potatoes, and collections of vegetables, which collectively were very well shown.

GROUPS.

As usual now at these autumn displays, the groups of Chrysanthemums in pots constituted an important feature, consisting as they did of wet flowered plants arranged closely together. Yet, imposing as the groups are, when massed together in the way now seen at exhibitions, would not the effect be much enhanced if the mass of flowers were relieved by the introduction of Palms and other suitable fine-leaved subjects amongst them? Of this there can scarcely be two opinions, and we throw out the hint for the consideration of those who have to compile the schedules, if it would not be worth their while to stipulate that the groups for which they offer prizes should include plants of the character named.

In the open class for groups occupying a space of 6 superficial feet, the competition was very close between Mr. F. Moore, gr. to W. C. Pickersgill, Esq., Mr. Tomalin, gr. to S. White, Esq., and Mr. Mitchell, gr. to Mrs. Arduthnot, who took the prizes in the order of their names; Mr. Moore's plants, in addition to being well bloomed, were good in foliage also—a fact which is not always so much taken into account as it deserves to be. Mr. Tomalin likewise had a very good group, whilst Mr. Mitchell's plants were remarkable for the size and development of their flowers. Standards, which for general usefulness in arranging in conservatories, halls, or elsewhere, are preferable to the flat trellised specimen, were well shown: Mr. Moore being 1st with well grown and finely flowered examples; Mr. Mitchell, who was 2d, also had a well bloomed half-dozen.

Mr. Mitchell was 1st for single standards, with a large specimen of Madame Berlie Bendall, splendidly flowered; 2d, Mr. Mitchell, with Elaine, very well done.

Four standard pompons.—1st, Mr. Mitchell, with well flowered examples.

In the amateur class the 1st prize for a group was taken by Mr. Blackstone, with a good set of plants, nicely flowered.

CUT BLOOMS.

These were in great number, most of the classes being well filled. Few flowers of indifferent quality were present even in the stands that were not successful. With twenty-four incurved flowers, not fewer than eighteen varieties, Mr. Moore had 1st honours, with excellent flowers of well known kinds; 2d, Mr. Mitchell, whose flowers consisted of the same or similar kinds.

Twelve blooms of incurved varieties.—1st, Mr. Mitchell, with a fine stand.

Twelve blooms, reflexed varieties.—1st, Mr. Moore, with a meritorious stand.

Twenty-four Japanese, not less than eighteen varieties.—Here again Mr. Moore took the lead, putting up an excellent stand; Mr. Mitchell, whose stand contained fine flowers, being 2d; 3d, Mr. Tomalin, who had a good lot of blooms.

Twelve blooms, large Anemone-flowered, not less than six varieties.—Mr. Moore, who here again took 1st prize, staged fine flowers.

In the class for twelve pompon Anemones Mr. Mitchell took the 1st prize.

In the second division of the show, with twelve incurved blooms, Mr. Adams took the lead, having

an excellent stand; Mr. Winter, who was 2d, also had a good stand.

Twelve Japanese.—In a close run 1st honours went to Mr. Adams, for an even set of blooms; 2d, Mr. Winter.

Six Japanese.—1st, Mr. Winter; 2d, Mr. Adams, both showing well.

Twelve pompons.—1st, Mr. Blackstone, gr. to F. Littlehales, Esq.

Six table plants.—1st, Mr. Moore, with clean well grown examples.

FRUIT.

Black Grapes, three bunches.—1st, Mr. Moore, with Black Alicante, medium sized bunches, very well coloured; 2d, Mr. Tomalin, whose bunches were composed of large berries, but a shade deficient in colour.

White Grapes, three bunches.—1st, Mr. Moore, with moderate sized bunches of Muscat of Alexandria, well coloured.

Pears were well shown. With six varieties Mr. Southcott took 1st, Mr. Mitchell being 2d.

Apples, six dishes.—1st, Mr. E. Fuller, who had beautiful fruit; 2d, Mrs. Southcott, whose examples were little behind those of his opponent.

VEGETABLES.

Collection of more than twelve sorts.—1st, Mr. Tomalin.

Collection of Potatoes.—1st, Mr. Fuller.

COTTAGERS' PRODUCTIONS,

in the shape of Chrysanthemums in pots, and also cut flowers, with collections of vegetables, &c., occupied a large space, and very well shown, especially the more useful kinds, such as Potatoes, Cabbages, Onions, and Turnips.

LINCOLN CHRYSANTHEMUM.

THE fourth annual exhibition of this prosperous Society was held in the Exchange on Tuesday and Wednesday, Nov. 16 and 17—the best yet held both as to numbers of entries, and excellence of quality. Mr. Wipf, gr. to C. Clayton, Esq., East Cliff House, arranged a grand group of plants in the centre of the room, comprising well variegated Crotons, Orchids, Fitcher-plants, &c., which proved the centre of attraction. Messrs. R. Pennell & Son, nurserymen, Lincoln, had also a large bank of Chrysanthemum plants, intermixed with Palms and foliage plants, besides Ericas, zonal Pelargoniums, &c. Mr. Ilwam, nurseryman, Nettleham Road, also showed Bivalvias, cut blooms, &c.

The best group of blooming and other plants, arranged for effect, was from Mr. Foster, gr. to H. Gresham, Esq. The following exhibitors won prizes for collections:—Mr. Brown, gr. to S. Lowe, Esq., and Mr. Brailsford.

CUT BLOOMS: OPEN CLASSES.

With thirty-six blooms, eighteen Japanese and eighteen incurved, Mr. E. Thornton, gr. to C. E. Hullett, Esq., was 1st, showing fine blooms of Baron Beust, Lord Walseley, and Soleil Levant; Mr. Bugg, gr. to W. Ashley, Esq., was a good 2d.

For twenty-four incurved Mr. Bugg was again 1st, and also for twenty four Japanese.

In class 4, for eighteen blooms, consisting of equal numbers of incurved, reflexed, and Japanese, Mr. Gill, gr. to —Ollham, Esq., won 1st prize, having amongst the latter a grand bloom of Madame C. Audouguer.

Mr. Browne, gr. to T. C. Burne, Esq., was 1st for twelve blooms incurved, and also for twelve blooms Japanese. Other prizes were taken by Messrs. Bugg, Mitchell, Elder, and Brailsford.

TABLE DECORATIONS.

The display of epergnes, dinner-table decorations, &c., was exceptionally good. For best arranged epergne Miss Pennell was 1st, and Miss M. Hamilton Holmes a good 2d; and for best arranged dinner-table decoration the same ladies won prizes in the same order.

Mr. Ulman was 1st for bouquets.

MISCELLANEOUS SUBJECTS.

Mr. Mitchell exhibited the best three dishes of dessert Pears; and for six heaviest Pears Mr. W. Hare, gr. to C. Neville, Esq., was a good 2d in the former class.

Mr. Hare also had the best black Grapes, and white Grapes, justly receiving the 1st prize in each instance; and also for the collection of Grapes, where Mr. R. Crawford, gr. to Colonel Thorpe, was a good 2d.

Dr. G. M. Lowe, Castle Hill was 1st, for best collection of Ferns, and also for best basket Fern, both being excellent exhibits.

For three Orchids in bloom, F. M. Burton, Esq., was the best exhibitor; he showed fine examples of Vanilla coccinea, small, but well flowered.

Many minor classes must be omitted, as well as those which included prizes for Tree Ferns, Cycads, &c.

WINCHESTER: Nov. 16 and 17.

The Guildhall was filled on the above named dates with the exhibits at the Chrysanthemum Society's fourth annual exhibition. It was the best of the series, and a great improvement has taken place since last year's show in the specimen plants and groups of plants. Grapes were staged in capital condition and large numbers, so were Apples, Pears, and vegetables. Cut blooms were staged in large numbers and of fine quality.

PLANTS IN POTS.

The best collection of Chrysanthemums grown in pots occupying a space of 8 by 6 feet, was staged by Mr. A. Prouting, gr. to Miss Butler, Winchester—the plants, both Japanese and incurved, having large flowers, the arrangement, too, was very good; 24, F. C. Birch, Esq., Winchester.

The best six in twenty-four blooms were staged by Mr. J. J. nurseryman, Shirley, Southampton, who had large well trained specimens, 5 to 6 feet in diameter, and freely flowered. Mr. Wills, gr. to Mrs. Pearce, Basset, Southampton, was 21, with good plants.

Mr. Wills was 1st for six Japanese, staging fine plants of the leading varieties; 2d, Mr. Astride.

Mr. Joy had the best single specimens of both incurved and Japanese, with fine plants of Mrs. Dixon and the same of the Rendaijer; and was closely followed by Mr. Wills.

Fifteen competitors staged plants in the class for six Chrysanthemums (grown within five miles of Winchester). Mr. J. Wareham, gr. to Mrs. T. Gunner, Winchester, was 1st, with capital plants.

For the best group of miscellaneous plants arranged for effect, Mr. Axford, gr. to C. M. Snipley, E. q., Twyford Moors, Winchester, received the highest award, for a very tastefully arranged group, characterized by extreme lightness. Mr. W. Neville, gr. to F. W. Flight, Esq., Cornhill, Twyford, Winchester, was a close 21; while Mr. T. Munt was a good 31.

Mr. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishops Waltham, had the best plants for table decoration.

CUT BLOOMS

formed the chief feature of the show, being very numerous and good in quality. The principal class was one for twenty-four distinct, eight to be Japanese, and the remainder incurved or reflexed. Mr. Molyneux was a very good 1st, and his blooms were large-sized, and of good substance and colour; Mr. Neville was 21, with smaller but neat flowers.

Class 9 was for twenty-four blooms, in not less than eighteen varieties. Mr. Molyneux was here a gain ahead; Mr. Bowerman, gr. to C. Hoare, Esq., Hickwood Park, Basingstoke, was 21, having capital specimens of leading sorts.

For twelve incurved, Mr. Molyneux again led the way with even neat specimens of the leading varieties; and was followed by Mr. L. Jennings, gr. to J. Freeman, Esq., Fount Lodge, Farnborough, with creditable flowers.

Mr. Molyneux followed up his previous success by taking 1st honours in each of the classes for twelve Japanese blooms; twelve reflexed, in eight varieties; and for twelve Anemone varieties.

In the class for twelve blooms in eight varieties, open to those not competing in the former classes, there were seven competitors, Mr. G. Trinder, gr. to Sir H. Mildmay, Dogmersfield, Winchester, showed best; and 21, Mr. Jennings.

Mr. Neville staged by far the best stand of pom-poms.

Miss Flight was awarded the 1st prize for the most tastefully arranged table of Chrysanthemums and foliage, with a charming combination of single varieties.

FRUIT.

Mr. T. Weaver, gr. to W. W. B. Beach, Esq., M.P., Oakley Park, Basingstoke, was 1st for three bunches of Grapes, distinct varieties, staging Muscat of Alexandria in capital condition, Alicante, fine in bunch and berry, and well finished; Lady D'Arms was 21, and the other two, Mr. Molyneux, who ran very close, staging fine samples of Barbarossa, Alicante, and Trebbiano; 31, Mr. C. Warden, gr. to Sir F. Bathurst, Bart., Clarendon Park, Salisbury.

For two bunches of black Grapes, Mr. Molyneux was an easy 1st, staging large, shapely bunches, well coloured, of Barbarossa; 21, Mr. Bowerman, with Alicante. Seven competitors staged in this class.

The best two bunches of white Grapes were staged by Mr. Bowerman, who depended upon Muscat of Alexandria; Mr. Weaver was a close 21.

Mr. Trinder had the best three dishes of dessert and 1 also of kitchen Apples; also the finest three dishes of Pears, all being good in quality.

Vegetables were extra fine, from Mr. Danucey, Mr. Lye, and Mr. Kneller, gr. to W. Portal, Esq., Basingstoke.

PEMBROKE SHIRE CHRYSANTHEMUM: Nov. 17.

The Titts Society held its show in the Assemblies Rooms, Pembroke, on the date above given. The weather, which threatened to be most unfavourable in the morning, fortunately cleared by mid-day, enabling the lovers of flowers to visit the show, which was well patronised throughout the day. The classes for pot plants were not so well filled as was anticipated, but those for cut blooms were more spiritedly contested.

The class for a group in a space 8 feet by 9 feet—prize given by Earl of Cawdor—only brought out two exhibitors, Mr. French, gr. to Colonel Saurin, winning 1st honours with an even, well grown lot of plants. This collection was closely followed by one from Mr. Fisher, gr. to the Earl of Cawdor, who exhibited a great variety of the most popular sorts taken from the Stockpool conservatory, and shown without any special preparation. This collection, being beautifully flowered and arranged was deservedly admired.

For six incurved or reflexed, Colonel Saurin was again 1st, staging good plants. The same exhibitor also showed the best Japanese, in a plant of Soleil Levant.

The cut flowers attracted much attention. In the class for twenty-four blooms, Mr. Dumble, gr. to Major Phillips, Pecton Castle, was 1st, his stand consisting of cut blooms of the finest varieties; Colonel Lynton taking the 21 prize, with blooms of considerable merit.

For twelve blooms, Major Phillips was again to the front; 21, Colonel Lynton.

A splendid collection of fruits, vegetables, and flowers, not for competition, came from the Earl of Cawdor, and was much admired.

The amateurs' and cottagers' classes were well contested, and some highly creditable exhibits of both plants and cut blooms were shown.

Great credit is due to the hon. secretary, Mr. R. H. Treweek, Pembroke, for the admirable manner in which the arrangements were carried out.

ASCOT and SUNNINGHILL: Nov. 17 and 18.

THE buildings which the Jockey Club possess at Ascot are utilised for one great racing ceremony only during the year, but being kindly granted to the committee of the local Chrysanthemum Society for their annual exhibition, are thus utilised for quite another and to many a more pleasing purpose. The show was greeted with a very wet morning on the first day, but later it became very pleasant.

In the entrance corridor were placed five large groups of the customary pattern, containing some really superb flowers of incurved varieties and some fine Japanese kinds came from Mr. Hughes, gr. to D. F. de Palavicini, E. q., Ascot, while Mr. Lane, gr. to Miss Dearing Smith, had the best grown plants, dwarf, finely foliated and flowered, but rather past their best. Other good groups came from Mr. Mead, gr. to A. Magniac, E. q., and from Mr. Savage, gr. to Bronn Huddleston. In this place a fine group of Chrysanthemums effectively fronted with small foliage plants, Heathy Ferns, &c., was arranged by Messrs. John Standish & Sons, Ascot; and from Messrs. Sattin & Sons, Reading, came a large collection of Potatoes, including many fine and handsome seedlings, backed by a selection of Kales, the dwarf green and purple kinds being specially prominent.

The trained plants were generally very good, the best six coming from Mr. Lane, and were about 31 feet over, full of bloom. These were Bouquet Fair, Hever Fleur, Mille Lacroix, Prince of Wales, Golden Christine, and Mrs. Dixon. Mr. Savage was 21, with plants of half pyramid form, while Mr. Hughes was 31, having semi-standard plants well bloomed.

Mr. Lane came 1st with three fine standards of Mrs. Dixon, and Golden and White Christine.

The best six pom-poms, large and fairly well bloomed, included good Aurora Borealis, Solomon, and Queen of Anemones. Decorative groups of plants were excellent, the best, which included many beautiful Calanthes, Oncidium, Dendrobium, and other good Orchids, elegantly arranged in a setting of Ferns, came from Mr. Paul, gr. to J. D. Boring, Esq., Windsor Forest. Chinese Primulas, Solanums, and table plants were numerous and good.

CUT FLOWERS.

A class for eighteen Japanese and some number of incurved blooms brought six competitors, the best being from Mr. Treharne, gr. to T. Ashby, Esq., Sunninghill; Mr. Page, gr. to A. Southern, Esq., being 21. There were many first-rate blooms in these stands.

The open class for sixteen incurved flowers was also a good one, Mr. Strong, Wellington College Gardens, having the best blooms. Mr. Hughes had in his stand, which came 21, many fine blooms.

Mr. Lane had the best twelve blooms; Mr. Tomlinson and Mr. Hubbard, gr. to General Thornhill, were placed equal 21, having very good blooms.

In the competition for six of one kind, the finest were from Mr. Cole. Mr. Tomline had the best twelve reflexed flowers. Japanese were first-rate, Mr. Page having a very strong sixteen; Mr. Cole was 21 with really very fine flowers. Mr. Lane stood 1st with twelve blooms, also very fine.

The class for six blooms was well contested, whilst that for six of one kind brought beautiful Belle France, fine Japonaise, and superb J. Delays, prizes going in this order. Mr. Tomline had the finest Anemones.

FRUIT

also was excellent, Mr. Lane having the best black Grapes in fine Alicante; and Mr. Wells was 21 with beautiful Copper's Black. The white kinds were all fairly good Muscats. Kitchen and dessert Apples, and beautiful lots of Pears, as also vegetables, formed an interesting portion of the show.

HULL AND EAST RIDING CHRYSANTHEMUM.

THE annual exhibition, lasting two days, of the Hull and East Riding Chrysanthemum Society was opened with much *clat* in the Artillery Barracks, Park Street, November 18. The inaugural ceremony was performed by the Mayor, and brought together a large and influential gathering. The Society has reason to feel proud of the show, which reflects no small credit upon the town at large. A finer collection could hardly be seen in any part of the country. The extensions which the Society has made each year will, if continued, eventually make it difficult for the committee to find adequate accommodation. But notwithstanding some drawback in this respect, the scene presented in the Artillery Barracks was one of great beauty.

The large hall contained a floral array of equal interest and variety to the horticultural displays in midsummer. In the gun-room the fruit and vegetable exhibits, and the remarkably handsome assortment of bouquets, ladies' shoulder sprays, and fancy floral designs offered charming contrasts upon which the eye rested with pleasure. The repository room was filled with Chrysanthemums in pots, several of these plants being of unusual proportions and colouring. The southern annex was occupied with the table decorations, which, shown by gaslight, looked extremely elegant. The great attraction of the large hall, and indeed of the show, was the display of cut blooms. These were laid out upon two long tables, which extended nearly the entire length of the room. They were as conspicuous for variety as for superiority of culture in size, quality, and colour.

In the class for forty-eight cut blooms the exhibit of Mr. William Mease, 1st, and Mr. T. Edwards, Miss, Bart., 2d, claimed attention. The Challenge Vase, offered by the Chairman of the Society (Mr. George Bohm), was taken by the former gentleman, but the competition was very close. Mr. F. W. Jameson, of Eistella, was another of the most successful competitors, two 1st and two 21 prizes falling to his share in this section. Mr. Bohm also secured two 21 prizes and one 31. A 1st premium also fell to Mr. Arthur Wilson for twenty-four blooms of several varieties, including twelve Japanese. The same gentleman secured 21 honours for a group of Chrysanthemums, in which the competition was very strong. Mr. George Lawson, Newland Grove, was the winner of the 1st prize in the latter, and with it a Silver Challenge Cup.

In the open classes for plants in pots, L'eu. Colonel Droschoff (gr. Mr. A. W. Stanley) had the most success, carrying off three 1st prizes, for a group of Chrysanthemums, for six distinct, for three trained specimens. In this department Mr. R. Stamper, Thorngumbald, would have taken a higher position with a very magnificent plant, containing no fewer than 200 blooms, but for the fact that the exhibit had suffered in transit.

To Miss E. M. Jameson the 1st prize fell for table decorations, and this, considering the keen competition and the number of entries, made the success of Mrs. Lady all the more notable. It should be stated that a piece of Challenge Plate, presented by the Chairman of the Society, accompanied this 1st prize.

The amateur class for cut blooms was marked by good competition, and a very creditable display was made. The leading exhibitor was Mr. A. W. Stanley, of Hull, who took no fewer than nine 1st prizes, as also one or two 2ds. Mr. E. Goddard, Hull, was the winner of the largest number of the 2d prizes in the same section.

In addition to the prizes already mentioned a special 1st prize was given to Mr. George Cottam, jun., of Cottingham, for an exhibit of three plants for table decoration. A First-class Certificate was awarded to Mr. Thomas Winkworth, Childwall Hall Gardens, Liverpool, for the Japanese Chrysanthemum Mr. Ralph Brocklebank, a sport from Meg Merrildes. A

Marguerite Cloth of Gold, shown by Mr. Robert Owen, Floral Nurseries, Maidenhead, was highly Commended.

The following presented special prizes for competition.—Mr. N. Davis, Camberwell, London; Mr. T. B. Morton, Durlington; Mr. R. Owen, Maidenhead; Mr. E. P. Dixon, Hull; Messrs. King & Co., Hull; Mr. Young, Newland Potteries, Hull; Mr. D. Toyne, Bridge Street, Hull; Mr. E. Worsall, Salt-house Lane, Hull; Mr. W. E. Martin, Market Place, Hull; Messrs. Barnett & Scott, Whitefriar Gate, Hull; Mr. K. Kemper, St. John Street, Hull; Mr. W. Henry, Salt-house Lane, Hull; Mr. G. N. Norris, Seaton Street, Hull; Messrs. T. Kirk & Co., Whitefriar Gate, Hull; Messrs. Barnby & Rust, Market Place, Hull.

The show was opened by the Mayor of Hull, who in a brief speech alluded to the beauty of the show and to the sound financial position of the Society. Several ladies acted as judges—an innovation that might more frequently be adopted with advantage at horticultural shows.

A First-class Certificate awarded to—Mr. Thos. Winkworth, Childwall Hall Gardens, Liverpool, for Japanese Chrysanthemum Mr. Ralph Brocklebank, a sport from Meg Merrilees.

The prize list, which Mr. Falconer James forwarded, is omitted, owing to our want of space.

CHISWICK HORTICULTURAL.

The second autumn exhibition of this Society took place in the Vestry Hall on the 18th inst., and was in every way a success. The display of Chrysanthemums, although somewhat late for the exhibitors, was very good.

GROUPS.

In the class for a group of Chrysanthemums, arranged in a space not exceeding 60 square feet, Messrs. W. Fromow & Sons, Sutton Court Nurseries, Chiswick, easily took 1st honours with a very even well-bloomed lot, arranged lightly and elegantly, the plants themselves showing great vigour and strength. Mr. A. Wright, gr. to E. H. Watts, Esq., Devonhurst, Chiswick, was 2d, most of the popular varieties being shown well.

CUT BLOOMS.

In the principal class—that for twelve incurved, and twelve Japanese—there was a keen competition, seven competing, the 1st prize being awarded to Mr. C. I. Waite, gr. to Col. W. P. Talbot, Glenhurst, Esher. His Japanese blooms were very fine and especially so Mad. C. Audigier, Grandiflora, Comte de Gerniny, Triomphe de la Rue de Châlets; incurved—Lady Talfourd, Barbara, Isabella Bott. Equal 2d prizes were awarded to Mr. H. Collyer, gr. to Mrs. Murrell, The Elms, Ealing, and Mr. Long, gr. to E. B. Kidges, Esq., Orchard Lane, Ealing. Amongst Mr. Collyer's best we noted Mons. J. Laing, Baron de Prailly, Mdle. Lacroix, Lord Alcester, John Salter, and Jeanne d'Arc. Mr. Long showed good blooms of Soleil Levant, Rosa Bonheur, Mons. Astorg, Venus, Golden Eagle, and Guernsey Nugget. 3d, Mr. E. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill House, Ealing, with a uniformly good stand.

Mr. Collyer was 1st for six reflexed, and also for pompons; Mr. Long was 2d in the former class. These two exhibitors also took several other prizes.

Special prizes for amateurs were offered by Mrs. Lee for twelve Japanese and twelve incurved, the 1st prize in each class being awarded to Mr. W. S. Larcobm, stationmaster, Turham Green, for most creditable flowers.

DINNER-TABLE PLANTS.

These with similar subjects were largely shown. Mr. A. Wright and Mr. Waite showed well here, receiving prizes as their names stand.

FRUIT AND VEGETABLES.

There was a fine display; Mr. Hudson, gr. to E. J. Atkinson, Gunnersbury House, Acton, taking the chief prizes for Grapes and Apples, showing in the former good bunches of Black Alicante and Muscat of Alexandria. Other prize-winners were Messrs. Waite (1st for Pears), E. Chadwick, A. Wright, R. Woods, and J. Coomber.

The Royal Horticultural Society staged a large collection of Apples and Pears and also of Grapes, consisting of well-known kinds.

Vegetables were well shown by Mr. C. J. Waite, his six kinds in competition for prizes offered by Messrs. Sutton & Sons.

Prizes were offered for Chrysanthemums, vegetables, &c., for competition amongst cottagers, which brought out a very creditable display.

MISCELLANEOUS.

Splendid competitive groups of Chrysanthemums were shown by Mr. May, gr. to the Marquis of

Bute, Chiswick House; and Mr. Roberts, gr. to the Messrs. Rothschild, Gunnersbury Park. Good selections of foliage plants were contributed by Messrs. W. Fromow & Sons and Messrs. Hooper & Co., Twickenham, all adding much to the general effect. Floral devices were shown by Messrs. Martin & Co., Kensington; and Mr. W. Gardiner, Bayswater; Mrs. Mott, Kensington, showing wreaths, &c.

CHORLEY CHRYSANTHEMUM:

Nov. 19 and 20.

THIS Society's third annual show of Chrysanthemums, plants, fruit, and vegetables, on the above dates, proved a remarkable success. The spacious Town Hall was well filled with highly meritorious exhibits, the open and gentlemen's classes bringing exhibits from a considerable distance, and the amateur's well filled classes proved their interest and skill in Chrysanthemum growing.

GROUPS.

was a leading feature in the open class. For a group of Chrysanthemums, arranged for effect, Mr. J. Mollison, gr. to J. Eckerley, Esq., Bunt House, Adlington, was conspicuously to the fore; 2d and 3d places were taken by Mr. G. Smith, gr., Ellerbeck Hall, and Mr. G. Park, gr. to Lieut.-Col. Farington, of Wigan, respectively, with fine plants.

Group of Feras arranged for effect.—1st, Mr. Drinkwater, gr. to Mrs. Baines, Prospect House, Wheatley; 2d, Mr. J. Smith, gr. to R. Shackleton, Esq., Willnell House, whose plants were decidedly better than the 1st; 3d were these placed 3d (Mr. Mollison's), but more closely and flatly arranged.

Groups of miscellaneous plants, arranged for effect, brought out but two competitors, Mr. G. Park being 1st with a tastefully arranged group, which included well grown Crotons, Dracænas, Pandanus—all brightly coloured; a well flowered plant of Clerodendron, Bilfoorianum, &c. Mr. J. Harrison, nurseryman, Chorley, was 2d, with a nice group of mostly small decorative stuff.

Messrs. Morley & Co. of Preston, were 1st, with Carnations and Edward's Queen; Mr. Chapple, Mr. Mollison, 1st, with Primulas; Messrs. G. Smith and G. Park, 2d and 3d.

Mr. G. Smith had the best six Cinerarias. Roman Hyacinths, six pots,—1st, Mr. G. Park. Mr. J. Harrison had 1st for six pots of Cyclamen. Table plants were numerous and good. Mr. C. Jones, gr. to Mrs. Shaw, Bolton, took 1st, being followed closely by Messrs. Mollison and E. Thrupp, gr. to J. Walmesley, Esq., Wigan.

POT PLANTS.

Competition was very keen. For six plants, three incurved and three Japanese, Mr. Chapple was 1st, his best being Queen of England. Cottage of Granville, La Nympe and R. Ballantine; 2d, Mr. G. Smith, with Lord Wolsley, Princess of Wales, Comte de Gerniny, Jardin des Plantes, L'Incomparable, and F. A. Davis; 3d, Mr. Dickinson, gr. to J. B. Cardwell, Esq., Whittle Springs, who had F. A. Davis and Guernsey Nugget, very good.

For three plants, Japanese, reflexed and incurved, Mr. G. Smith came 1st, with Comte de Gerniny, Cullingford, and Mrs. G. Rundle; 2d, Mr. Chapple with plants exceedingly good.

Three pompons.—Mr. Chapple 1st, with Cedo Nulli, white and lilac, and Golden Mdle. Martha; Mr. G. Smith 2d, and Mr. Dickinson, whose plants were very stiffly traieed, 3d.

For single specimen, pompons excluded.—Mr. Chapple was a capital 1st, with a magnificent plant of La Nympe; Mr. G. Smith 2d, with Mrs. Forsyth.

Specimen pompon.—1st, Mr. Mollison, with a fine specimen of Sœur Melaine; 2d, Mr. G. Smith, with Kosinante, very good.

CUT BLOOMS.

This was exceedingly good and the entries numerous. Mr. Chapple was awarded 1st for eighteen, nine Japanese and nine incurved; Mr. Jones being a very close 2d, with several splendid blooms.

Mr. Jones took 1st for twelve, having very fine blooms.

For six, Messrs. Chapple, Dickinson, and Mollison were successful.

FRUIT.

though not abundant, was very fine. Two excellent bunches of Black Alicante won for Mr. Mollison 1st honours; Mr. Park coming 2d; and for scarcely less meritorious examples, Mr. W. Smith, gr., Duxbury Hall, was awarded a special.

Mr. W. Smith was well 1st for white Grapes, with two capital bunches of Muscat of Alexandria; Mr. Thrupp followed with Golden Queen; and Mr. Parks 3d, with smaller bunches of Muscat of Alexandria.

VEGETABLES.

Capital trays of these were shown, honours for which fell to Messrs. W. Smith, Mollison, and Linkwater. The former also competed well in a special class provided for them.

A very fine Lemon tree, among other plants, not for competition, was noteworthy, being laden with its golden fruit. This was sent by Mr. G. Parkinson, gr. to H. Rawcliffe, Esq., Gillibrand Hall. T. Z.

NATIONAL CHRYSANTHEMUM:

Nov. 24.

A MEETING of the Floral Committee took place on the above date, when a considerable number of flowers were sent for inspection and certificates. At the outset of the proceedings it was unanimously resolved that for the future when any new variety of Chrysanthemum is shown by more than one exhibitor, the Certificate, if awarded, shall be given to the one producing the new variety in its best form.

Mr. Martin Dartford, sent blooms of Japanese Chrysanthemum Springs, pale pink, incurved, large and full flower (Commended).

From Mr. Winkworth, Liverpool, came a fine golden sport from Meg Merrilees, named Mr. R. Brocklebank, large, full, and fine, and regarded as one of the best sports of the year (First-class Certificate).

From Mr. Sullivan, gr. to D. E. Chapman, Esq., Roehampton, came a seedling Japanese named D. E. Chapman, magenta, regarded as a very fine late variety, large and full (First-class Certificate).

From Mr. T. S. Ware, Tottenham, came Charles Halle, a hybrid large flowered variety, clear pink in colour, tubular petals; Commended as likely to prove a good decorative variety. Also Iona, an incurved variety of a deep amber-brown colour, with frimbriated petals, and Commended as a frimbriated variety. From Mr. W. E. Boyce, nurseryman, Holloway, came pompon Rubra Perfecta, rich orange-crimson, like a small Japanese Citron—the shade of colour between that and Julia Lagravere (First-class Certificate); also Japanese Citron, bright yellow, promising, but only one flower was shown.

From Mr. Mizen, of Mitcham, came a pale golden incurved flower, said to be a sport from Jeanne d'Arc, the flower of excellent build, and regarded as a valuable late variety (First-class Certificate).

Messrs. J. Laing & Co., nurserymen, Forest Hill, sent several new Chrysanthemums, but as single blooms only were produced, they could not be dealt with.

From Mr. R. Owen, nurseryman, Maidenhead, came pompon Osiris, dark amber flushed with rose at the base; a very pleasing well formed flower (First-class Certificate); Petro Diaz, bright reddish-chestnut, large, full, and finely reflexed (First-class Certificate as a Japanese variety); Japanese Dr. Crevaux, rosy-carmine, shading to white, white reverse, distinct in colour, but said to be a tall grower. Chrysanthemum coronarium, Cloth of Gold, single (Commended for its good form and colour).

From Messrs. H. Cannell & Sons' nurserymen, Swanley, came a large number of new varieties, the most striking of which were incurved La Gracieuse, silvery pale pink, very promising, but one flower only shown; single Japanese, Marigold, bright red, with streaks of white, and yellow centre, very pretty and distinct (First-class Certificate); large-flowered Anemone, Mrs. W. Holmes, delicate blush, not so deep in colour as Prince of Anemones, very pretty and good (First-class Certificate); Japanese L'Or du Japon, crimson and gold, pale centre, good substance and petal (First-class Certificate).

From Mr. Kendall, Roehampton, came Japanese Moonlight, with large incurved white flowers of the character of those of Madame C. Audigier (First-class Certificate).

RECENT CHRYSANTHEMUM SHOWS.

BRIGHTON AND HOVE.—The exhibition of the Brighton and Hove Society took place on November 16—17, and was said by competent persons to have been the best yet seen in the Pavilion. The plants fell under two categories—groups and trained. In the former class Mr. J. Miles, of the Bristol Nurseries, Kemp Town, secured the 1st place, and a gardener, Mr. Bunney, of Denny Park, the 2d. In the latter class Mr. Hill, gr. to M. Wallis, Esq., Willideane, was the winner of the highest prize. In cut blooms Mr. Gore, gr. to Captain Taylor, Glenleigh, Hastings, took the premier prize in the 4th class. Mr. Russell, gr., to Mr. Lees, took the 1st prize for the twenty-four incurved varieties. A considerable amount of plants which may be classed as miscellaneous were shown, consisting of the usual subjects found at these autumn exhibitions—all nice, but nothing novel. Messrs. Balchin & Sons, and Mr. G. Miles added much to the attractiveness of the saloons by the liberal use of plants and flowers in various positions. Fruit and vegetables were shown in capital style, the prizes chiefly falling to the local

gardeners. Mrs. J. Binns showed her pretty framed bouquets of flowers, Ferns, &c., receiving a Certificate and Commendation.

EASTBOURNE : NOV. 22, 23.

This Society has been this year inspired with new life by the efforts of Mr. W. Jupp, Torfield Old Town who, assisted by an energetic committee and guarantee fund, subscribed by gentlemen of the town and vicinity, was enabled to offer a very enticing schedule to growers. The result was an excellent show, and, as the weather was fair during the days it was open, the returns were all that reasonable people could desire. Groups were a telling feature, and were full and pleasing, without being formal. Mr. E. Hemsley, gr. to A. Dore, Esq., Arundel, taking the 1st prize. Mr. Gore, of Glenleigh, Hastings, took the lion's share of the prizes in the bigger classes. Fruit, vegetables, Potatoes, and Tea Roses from Mr. Jupp's garden formed the other items of interest.

YORK ANCIENT FLORISTS: NOV. 17, 18, 19.

This was the seventh annual meeting of the Society, and owing to the manner in which the Chrysanthemum growers responded to the invitation given, it proved a very successful one. Cut flowers, especially the incurved section, showed much improvement over former years, and moreover the working-man amateurs came to the front in an admirable manner.

What is of equal importance with anything mentioned above, the attendance was large, for we all know that when gate money is abundant the duties of officials are considerably lightened, and competitors put on the smile of satisfaction.

Mr. McIntosh, gr. to J. T. Huyton, Esq., Clifton House, York, took the highest honours in the group class, and also in the mixed Chrysanthemum group, where foliage plants are allowed; a more common-sense method of showing the beauties of the flower than the commoner one seen at almost all other shows. The Silver Cup given by the Lord Mayor of York accompanied the latter prize. In a smaller group Mr. Ewerd, gr. to Mr. Gutch, Holgate, York, took 1st prize, as also in the class for nine incurved and reflexed plants. In the class for six plants of Japanese varieties, Mr. T. Smith won 1st honours with splendidly bloomed specimens. In the cut-bloom classes the highest award for thirty-six fell to Mr. Falcard, gr. to W. B. Richardson, Esq., The Mount, York, who took likewise the 1st in the class for twelve incurved flowers, and Mr. Short, gr. to A. Pease, Esq., Darlington, took 1st for an equal number of reflexed kinds.

A collection of 130 varieties was shown by Mr. Morton, nurseryman, of Darlington, the prize awarded for which was a tea-service. Stove and greenhouse added further attractiveness to the show; and fruit and vegetables were well and plentifully shown, competitors being stimulated by the hope of securing the different special prizes of value offered by the committee.

C. E. BROOME.

In our last number we briefly alluded to the death of this amiable and accomplished botanist. His retiring disposition made him averse from publicity, and consequently, save by his immediate friends, little is known of his career. We believe that his name first occurred as an author in conjunction with that of the Rev. M. J. Berkeley, in the *Annals of Natural History* for October, 1848. Previously to that he had communicated to Mr. Berkeley descriptions or specimens of many underground fungi allied to Truffles, which Mr. Berkeley commented on in the *Annals of Natural History* for May, 1844. In this publication many species of Truffles are recorded for the first time as British. Mr. Broome's connection with Mr. Berkeley as an illustrator of fungi began systematically in 1850 in the publication just named, and was continued up to 1881, since which time similar contributions by both authors have been made to *Grevillea*.

Mr. Broome's devotion to fungi took origin from having seen a fungus protruding from the ground. The specimen was collected and sent to Mr. Berkeley for identification, and if we are correct in our recollection the species proved to be either entirely new to science, or at any rate new to Britain. Stimulated by this lucky find, Mr. Broome continued his researches, and by careful "raking" succeeded in adding to the list nearly all the species of Truffle and allied plants now known to be members of our Flora. Mr. Broome's researches were not confined to the fungi of this country, but embraced those of other countries, the results being almost invariably published conjointly with Mr. Berkeley. Mr. Broome also undertook much of the tedious and irksome

measurements of the spores on which so much stress is laid. To the Bath Natural History Society Mr. Broome contributed an excellent list, with critical notes on the species of fungi found in the neighbourhood of that city. Of late years Mr. Broome made visits in November to Epping Forest, often in company with Mr. W. G. Smith, and provided with a short-handled rake and other tools for disinterring fungi.

Mr. Broome took great interest in the "resting-spore" question of the Potato fungus, and for two years supported Mr. Worthington Smith's views as to the resting-spore of *Phytophthora infestans*. He preserved the decaying foliage and kept it under frequent observation, specimens being mounted by the Rev. J. E. Vize. His experiments and observations led him to agree in the views taken by Mr. W. G. Smith, and to question the deductions of De Bary. Mr. Broome had previously detected the resting-spores of an allied fungus attacking Turnips (*Peronospora parasitica*), as mentioned by Mr. Berkeley in these columns, 1854, p. 724. Mr. Broome had, in addition to a special knowledge of fungi, a good general knowledge of plants both wild and cultivated, and his tastes were those of a man of culture and refinement; his conduct that of a high-minded, albeit too diffident, gentleman.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, NOVEMBER 24, 1886.

- Nov. 18.—Fine and bright; dry throughout.
- 19.—Thin mist at 9 A.M.; fine, but dull afterwards.
- 20.—Bright in morning; dull afternoon; fine night.
- 21.—Slight showers in morning, frequently very dark; dull and overcast afternoon.
- 22.—Thick fog in morning; fine and bright afternoon.
- 23.—Dense cold fog till 1 P.M.; temperature at 1 P.M., 33°; at 2 P.M., 41°; 5, the maximum of the day; fog a.ain at night.
- 24.—Dense cold fog till 12 A.M.; fine and bright at 1 P.M.; fog again in afternoon.

LONDON: Atmospheric Pressure.—During the week ending November 20, the reading of the barometer at the level of the sea increased from 29.48 inches at the beginning of the week, to 29.61 inches by the afternoon of the 14th, decreased to 29.49 inches by the afternoon of the 15th, increased to 29.74 inches by 4 P.M. on the 16th, decreased to 29.38 inches by the morning of the 17th, increased to 30.39 by the morning of the 20th, and was 30.36 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.84 inches, being 0.33 inch higher than last week, and 0.09 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 54° on the 15th and 20th; the highest on the 18th was 47° 2. The mean of the seven high day temperatures was 51° 1.

The lowest in the week was 29° 2 on the 19th; the lowest on the 16th was 46°. The mean of the seven low night temperatures was 37° 9.

The greatest range of temperature in one day was 23° on the 20th; the smallest on the 16th was 2° 5. The mean of the seven daily ranges was 13° 2.

The mean daily temperatures were 46° 3 on the

14th, 48° 6 on the 15th, 46° 7 on the 16th, 47° on the 17th, 42° 1 on the 18th, 39° 8 on the 19th, and 44° 9 on the 20th. These were all above their averages with the exception of the 19th, which was 2° below, by 3° 8, 6° 3, 4° 5, 5° 0, 0° 2 and 3° 2 respectively.

The mean temperature of the week was 45° 1, being 3° 2 higher than last week, and 3° above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 83° on the 17th. The mean of the seven readings was 69°.

Rain.—Rain fell on four days to the amount of 0.45 inch.

ENGLAND: Temperature.—During the week ending November 20, the highest temperatures were 57° at Truro, 56° 5 at Cambridge, and 50° at Newcastle; the highest at Sunderland was 50°, at Wolverhampton 52° 1, and at Preston 53°. The general mean was 54° 4.

The lowest in the week were at Blackheath, 29° 2, at Hull 3° 5, and at Cambridge, 30° 1; the lowest at Truro was 49°, at Liverpool 39° 1, and at Bradford and Preston 38°. The general mean was 34° 5.

The greatest ranges of temperature were at Cambridge, 26° 4, at Blackheath 24° 8, and at Hull 24° 1; the least ranges were 15° at Preston, 15° 1 at Bradford, and 16° at Sunderland. The general mean was 19° 9.

The mean of the seven high day temperatures was highest at Truro 55° 6, at Plymouth 54° 1, and at Bristol 52° 7; and lowest at Sunderland, 47° 1, at Wolverhampton 48° 3, and at Preston 48° 4. The general mean was 50° 8.

The mean of the seven low night temperatures was highest at Truro, 45° 7, at Plymouth, 43° 6, and at Liverpool, 42° 2; and was lowest at Hull 36° 4, at Sunderland, 36° 8, and at Wolverhampton, 37°. The general mean was 40° 1.

The mean daily range was greatest at Blackheath and Newcastle 13° 2, and at Cambridge 12° 8; and least at Preston, 6° 7, at Bradford 7° 1, and at Liverpool 8° 8. The general mean was 10° 7.

The mean temperature was highest at Truro, 50° 2, at Plymouth 48° 5, and at Bristol 46° 5; and lowest at Sunderland, 41° 6, at Wolverhampton 42° 2, and at Hull 42° 4. The general mean was 45° 1.

Rain.—The largest falls were 1.20 inch at Brighton, 0.86 inch at Truro, and 0.65 inch at Plymouth; the smallest falls were 0.09 inch at Sunderland, and 0.14 inch at Bradford and Newcastle. The general mean fall was 0.40 inch.

SCOTLAND: Temperature.—During the week ending November 20, the highest temperature was 57° 5 at Glasgow; the highest at Dundee was 53° 3. The general mean was 55° 4.

The lowest temperature was 29° 4 at Glasgow; the lowest at Leith was 37° 3. The general mean was 33°.

The mean temperature was highest at Paisley, 45° 7; and lowest at Perth, 41° 2. The general mean was 43° 4.

Rain.—The largest fall was 2.02 inches at Greenock; the smallest fall was 0.31 inch at Edinburgh. The general mean fall was 0.82 inch.

JAMES GLAISHER, F.R.S.

Obituary.

AUGUSTE VAN GEERT.—We greatly regret to have to announce the death of one of the famous horticulturists of Ghent, Auguste van Geert, who died, somewhat suddenly, on November 24, at the age of 68. M. van Geert was one of the founders of Ghent horticulture. He was the son of Jean van Geert, the associate of Verschaffel and van Houthe. Auguste van Geert at the early age of twelve years entered the establishment of Messrs. Knight & Perry at Chelsea, the predecessors of the Messrs. Veitch, and soon entered into relations with the Loddiges, the Rollissons, the Lows, and other famous English horticulturists of the day. Scarcely more than a fortnight since Auguste van Geert took part, in apparently good health, in the jubilee festival of his son-in-law, Edouard Pynaert. M. Auguste van Geert had been ailing for some years, but his sudden death has come as a surprise and a profound grief to his friends. Of late years M. van Geert took great interest in the culture of Orchids, of which

he had a large private collection. M. van Geert occupied a foremost place in Belgian horticulture, and received many testimonies from his friends and from the Government which evinced the esteem in which he was held. We were ourselves witnesses, on one occasion, of a touching scene, in which his daughter, Madame Pynaert van Geert, offered her congratulations to her father on an occasion when her father was the recipient of some state honour, and which made a great impression on us at the time, as being so very un-English, and yet so thoroughly appropriate on both sides.

Enquiries.

"He that questioneth much shall learn much."—BACON.

TOMATOS.—Has any grower, or firm of growers, in England produced 1000 tons of Tomatos in a single year? *Sceptic.*

Answers to Correspondents.

TO THE TRADE.—Members of the Trade will be obliged by sending notes of matters of Trade Interest, Cultural or Commercial. Short notes of daily experience are what are most useful.

ANTS IN HOTHOUSES: L. Use carbolic acid or paraffine, or trap them with treacle.

BEE ORCHIS: A. T. Ophrys apifera.

BRITISH PLANTS ILLUSTRATED: J. G. Handbook of the British Flora, by G. Bentham (L. Reeve & Co., 5, Henrietta Street, London), price 12s. Illustrations of the British Flora, by W. H. Fitch and W. G. Smith, a companion to the above, published at same office as the first given.

CHRYSANTHEMUM: A. E. We cannot undertake to name florists' flowers. Send to a grower of these plants.

CLOCHES: J. H. You would probably get them from J. B. Robinson, 14, Moor Lane, Cripplegate, E.C., or Deane & Co., 46, King William Street, London Bridge, E.C. The firm you mention may have ceased to exist.

DATURA: J. S. C. We strongly advise you not to use this for your beds.

DEWAR'S RED BEET: R. D. In our article on Messrs. J. Wrench's trial grounds last week it was stated that the above-named Beet is identical with Nutting's; but this, we are informed, is not so—it differs in size, colour, and flavour.

FUNGUS: G. P. York. Zylaria hypoxylon, not uncommon about stumps.

GRAFTING-WAX: A. Try a mixture of four parts of resin, three of bees-wax, and three of lard, melted and mixed.

INSECTS: H. B. Your Primulas and Taxifragas are attacked by the larvæ of the weevil (Otiorynchus sp.). Repot and sift the earth (which should be baked). It destroys the grubs, easily seen; water with strong solution of ammoniacal liquor and common salt. A handful of fresh gas-lime may be mixed with the earth. C. C. H.

JUNIPER: G. D. The needle-like foliage occurs on all young Junipers, and sometimes occurs also on the older branches. It is a natural phenomenon, and has nothing to do with grafting.

MOSS ROSES FOR MARKET: C. F. The common Moss, the prolific Moss, Mossyde Meaux, old White Bath. The National Rose Society issue the Rose-grower's Year Book, edited by the Rev. H. H. D'Ombraun, Hon. Secretary (London: Benrose & Sons, Old Bailey, and Derby). One of the best works on Roses is the Rose Garden, by W. Paul (Kent & Co., 23, Paternoster Row).

NAMES OF FRUITS: Errata—G. H. F. For "Naknon," read "Nyon."—James Hopkins. For "Regener," read "Rymer."—D. G. H. D. For "Doyen de Commerce," A. R. L. Napoleon.—C. F. B. Beurri. Diel.—F. & A. D. & Sons. 1, Beauty of Kent; 2, Golden Noble.—Old Subscriber. 5, Cox's Orange Pippin; 6, Old's Apple; 8, Scarlet Nonpareil; 9, Golden Pearmain; 10, French Crab.—H. A. Nelson's Glory is a synonym of Warner's King. Lord Derby is true. Cox's Orange is King of the Pippins. The others are not recognised; 4 and 6, most probably cider fruits.

NAMES OF PLANTS: H. S. C. P. 1, next week; 2, Salsvia caelestifolia; 3, S. leucantha; 4, S. Grahami var.; 5, S. Grahami purpurea.—M. Y. Your cones are, we believe, from a variety of Pinaster which sometimes produces solitary cones. Can it be the variety Lemonia? If so, the habit would be distinct.—Old Subscriber. Should know better than to pack his specimens in cotton wool, and to omit affixing numbers to them. One with berries is the Cockspar Thorn, Crataegus crus-galli; another a variety of the common Elm, Ulmus campestris, while the oblong entire, green leaves are those of the Wig plant, Rhus cotinus.—R. M. Probably one of the forms of Pinus Laricina. The Vaccinium-like plant seems to be Andromeda calcutata.

THE LARGEST ORCHARD IN ENGLAND OCCUPIED BY ANY ONE TENANT: Enquire: Lord Sudely, at

Toddington, in Gloucestershire, is believed to have the largest fruit farm in England.

TOBACCO CULTURE IN THE SOUTH PACIFIC: J. H. Warford Lock on the Culture of Tobacco, and Semann's great work—Flora Ultrivivis. There is no small Flora of Fiji that we know of.

*. All communications intended for publication should be addressed to the "Editor." Such communications should be written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

Markets.

COVENT GARDEN, November 25.

No alterations to quote. Business quiet. James Webster, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Includes Apples, Grapes, Kent Cobs, Lemons, Pears, Pine-apples, Kent Cobs, Plums.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Includes Artichokes, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Lettuce, Potatoes, Mushrooms, Mustard, Parsley, Potatoes, Spinach, Tomatoes, Turnips.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant and Price. Includes Aralia Sieboldi, Begonia, Bouvardias, Chrysanth, Cyclamen, Dracena terminalis, Epiphyllum, Erica gracilis, Fuchsia, Geranium, Heliotrop, Jasmine, Laurustinus, Lilium longiflorum, Marguerites, Mimosa, Pelargoniums, Primulas, Pyrethrums, Roses, Solanum, Tropaeolum, Tuberoses, Violets.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower and Price. Includes Arum Lilies, Anemone, Bouvardias, Camellias, Carnations, Chrysanth, Eucharis, Galathea, Heliotrop, Jasmine, Laurustinus, Lilium longiflorum, Marguerites, Mimosa, Pelargoniums, Primulas, Pyrethrums, Roses, Solanum, Tropaeolum, Tuberoses, Violets.

SEEDS.

LONDON: Nov. 24.—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, E.C., state that there is more business passing in Trefoils; quality being exceedingly scarce are fully 2s. 6d. per cwt. higher. Clover seeds generally remain quiet but firm. Foreign Canary seed well sustained, the rice previously noted, home-grown lots, however, exhibit no advance. Hemp and Rape seed are without quotable change; extremely low values now prevail. For blue boiling Peas there is a better demand, owing to the colder weather. Haricots are more in favour; quotations moderate. Spring Tares are somewhat better than heretofore known. No business passing in other articles.

CORN.

MARK LANE: Nov. 22.—In Wheat there was more disposition to buy, and at 6d. per quarter advance upon the rates of Monday last a good all-round business was concluded. For English red Wheats, and also for Indian and Russian, 1s. advance was asked, and in some instances obtained, but not currently. Flour followed Wheat with an advance of 6d. per cwt., of which sales of fair extent were effected. Malting Barley was exceedingly firm, with a fair demand. Grinding description were unaltered in value, and taken off slowly. Maize was fully supported, but not currently. Oats weakened the market for the commoner qualities, which were 3d. per quarter lower on the week, and very quiet.

Nov. 24.—The small sales of Wheat effected were at firm rates, for both English and foreign. Flour, whilst quiet, was fully supported. For malting Barley the trade continued firm, but grinding sorts met a slow sale, and prices barely so strong. Beans and Peas were taken off in retail quantities at full prices. Maize was firm from scanty supply. Oats with good arrivals sold slowly, with rates of the commoner grades tending in favour of buyers.

Average prices of corn for the week ending Nov. 20:—Wheat, 31s. 4d.; Barley, 27s. 6d.; Oats, 17s. 1d. For the corresponding period last year:—Wheat, 30s. 10d.; Barley, 26s. 6d.; Oats, 18s. 6d.

FRUIT AND VEGETABLES.

COLUMBIA (East London): Nov. 24.—A good supply but trade rather languid, at prices as follow:—Horse Radish, 1s. to 1s. 2d. per bundle; Parsnips, 8d. to 1s. per score; Cabbages, 1s. to 1s. 6d. per tally; Savoy, 1s. to 2s. 10d.; Brussels Sprouts, 1s. 6d. to 2s. per sieve; Greens, 1s. to 1s. 3d. per dozen bunches; Parsley, 1s. to 1s. 6d. per bush; Peetroots, 1s. to 2s. 10d.; Celery, 6d. to 10d. per bush; Onions, 3s. 6d. to 4s. per cwt.; Carrots, 15s. to 25s. per ton; Mangels, 17s. to 18s. 10d.; Turnips, 1s. to 1s. per dozen bunches; Carrots, 1s. 6d. to 2s. 10d.

STRAFORD: Nov. 23.—There was a good supply and a brisk trade at the undermentioned quotations:—Savoy, 4s. to 5s. per tally; Greens, 1s. per dozen bunches; Turnips, 1s. 6d. to 2s. 10d.; Carrots, 1s. per score; Mangels, 14s. to 17s. per bush; Swedes, 15s. to 22s. 6d.; Watercress, 1s. per dozen. Apples, 3s. 6d. to 4s. per bushel; do. 2s. per half-bushel.

POFA GOS.

BOROUGH AND SPITALFIELDS: Nov. 23.—Rather large supplies and some slow business without material change, as follows:—Kent Regents, 70s. to 110s.; Magnum Bonum, 65s. to 105s.; Victoria, 70s. to 105s.; Champaign, 50s. to 70s.; Hebrons, 80s. to 110s. per ton.

COLUMBIA (East London): Nov. 24.—Quotations:—York and Lincoln Magnums, 55s. to 70s.; Regents, 60s. to 75s.; Cambridgeshire Regents, 60s. to 70s.; Magnum Bonum, 55s. to 75s.; Essex Regents, 70s. to 80s. per ton.

STRAFORD: Nov. 23.—Quotations:—Best Magnums, 60s. to 80s.; second do. 55s. to 60s.; Champaign, 55s. to 68s.; and Regents, 70s. to 100s. per ton. Imports.—The imports into London last week consisted of 3943 bags from Hamburg, 600 Bremen, 24 Amsterdam, 41 packages Honfleur, 12 sacks Bordeaux, and 6 baskets from Rotterdam.

HAY.

WHITECHAPEL: Nov. 23.—Good supplies and slow trade, checked partly by the fog. Prices unaltered. Quotations:—Clover, best, 8s. to 10s.; inferior, 7s. to 8s.; hay, prime, 7s. to 9s.; inferior, 5s. to 6s.; and straw, 2s. to 3s. per load.

Nov. 25.—There was a fair supply on offer. The trade was dull, except for straw, prices for which were dearer.

CUMBERLAND (REGENT'S PARK): Nov. 23.—A good supply of Clover and meadow hay, with trade in favour of buyer. A fair supply of straw, with trade firm. Quotations:—Clover, best, 8s. to 10s.; inferior, 7s. to 8s.; hay, prime, 7s. to 9s.; second, 5s. to 7s.; and straw, 2s. to 3s. per load.

STRAFORD: Nov. 23.—Quotations:—Hay, 7s. to 8s.; Clover, 7s. to 9s.; and straw, 2s. to 3s. per load.

Government Stock.—Consols closed on Monday at 102 to 102½ for delivery, and 102½ to 102¾ for the account. Tuesday's closing quotations were 102½ to 102¾ for delivery, and 102½ to 102¾ for the account. Wednesday's closing quotations were 102½ to 102¾ for delivery, and 102½ to 102¾ for the account. Thursday's closing record was 102 to 102½ for both transactions.

COCOA-NUT FIBRE REFUSE.

Newly made. Truckload (2 tons) £1; 40 bags, 25/; Free on rail. Cash with order.—ST. JOHN'S AND CO., Fibre Merchants, 215, High Street, Battersea, S.W.

KELP — KELP — KELP.—

This powerful and stimulating Ash, made from the sun-dried plants of Lammaria digitata and other selected seaweeds, is especially rich in Potash, and Phosphoric Acid. Mixed with three times its bulk of dry soil, its effect on Vine Borders, Tomato Plants, and nearly all other selected vegetables, is unequalled, with no better dressing exists for Potatoes, Peas, Sea-kale, and Celery. It is an excellent Renovator for Old Garden Soil, and exhausted and Moss-grown Lawns. Price (for cash with order only) 5/ per bushel-bag, bag included. Cheap through rates 10d Southampton or Weymouth.

J. E. FERRY, La Poudreterie, St. Martins, Jersey. 15.—As the Seaweeds selected for this Ash can only be harvested during the spring tides of the four summer months, and then at some distance from the mainland, the supply is necessarily limited, and Orders will therefore be executed in strict rotation.

THOMSON'S IMPROVED WINE and PLANT MANURE.—This valuable Manure is made up solely on our premises, being a Jovny Bag and Tin has our Name on it. It can be had from all Nurseries and Seedsmen, and direct from us, 1 cwt. and over carriage paid. Our London Agent is Mr. GEORGE, 10, Victoria Road, Putney, S.W.

W.M. THOMSON AND SONS, Clarendon, Galashiels, N.B.

BEESON'S MANURE is the best for all Horticultural Purposes. Sold in tins, 1/2, 2/ 6d., 5/ 6d., 10/ 6d., or 1 cwt. bags, sealed, 1/30 each. By all Nurseries and Seedsmen, or direct from the Caribee Bone Mills, Sheffield. Also pure UNBOILED BONES, any size, and guaranteed of the best quality.

PEAT and SAND.—Light Brown PEAT for Nursery and Greenhouse Work, in four ton trucks of 10 yards each, at 10s. per yard. In bags, at 2s. 6d. per bag. Rhododendron and American Plant Beds, at 15s. per ton. Orchard Peat 4s. 14 lb. 5s. 20 lb. SPHAGNUM, 11s. 6d. per sack. SILVER SAND, coarse or fine, 1/2 per ton. WALKER and CO., Farnboro' Station, Hants.

GARDEN REQUISITES.

THE PRIZE MEDALS.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainer sorts are especially adapted for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense.

As do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E. Agents for LOCKER'S PATENT "ACME" FRAMES, PLANK GREENS, and PROPAGATING BOXES, also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Patterns of Plain or more elaborate Design, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, &c. Grooved and other Stable Faving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Tiles, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, or Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post.

FLINTS and KILN BRICKS for Roosters, or for KENT PEATS or LOAM supplied at lowest rates in any quantities.

ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A Liberal Discount to the Trade.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, New Gardens, and at the seats of most of the Nobility in Great Britain, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 1/2 6d. per gallon, at the Manufactory, or 1/2 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. From ALFRED LOWE, Esq., The Rectory, Alderley Lodge.

"Some twenty years ago I used your Black Varnish, and shall be glad if you will send me a sample of the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted." CAUTION.—Hills & Smith's Varnish, particularly warn their Customers against the various cheap Varnishes now so much advertised. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH, Brierly Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 136, Stephen's Green, Dublin.

SMITH'S-COLCHESTER LIVE-LONG CANDY, THE BEST DIGESTIVE.

No household should be without this valuable and palatable Stimulant so highly spoken of by the great Duke of Wellington. A small piece taken after a meal is an effectual preventive of indigestion. THE GREAT DUKE OF WELLINGTON RECOMMENDING SMITH'S COLCHESTER LIVE-LONG CANDY. GASTRION, Heaviness or Burning in the Chest and Fullness after Meals; or, taken at bedtime, by its warming and Stomachic properties PROMOTES SLEEP. A small piece dissolved in the mouth when exposed to damp and cold. WATER: THE CHESTY, and prevents those injuries which arise from Chills. It is invaluable to all ShortBreasts, and is recommended by the Duchess of Beaufort, the Marquis of Waterford, &c. Price, 1s. 4d. 3s. 9d., & 4s. 6d.; of all Chemists. Be careful to buy only SMITH'S-COLCHESTER LIVE-LONG CANDY, PREPARED BY SHENSTONE (Late Smith & Shenstone), CHEMIST, COLCHESTER. In consequence of its p. purity, and the commonness of the name (Smith's) imitations are made. Per post, 1s. 4d., 3s., and 5s.; or, sample, free.

THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stove-hole, and no hot-water tank for filling. The Boiler stands in the Greenhouse, the front only being outside, so that the whole of the heat from the Boiler is utilised. It burns over twelve hours without attention, at a nominal cost. Price, as engraving, with Boiler, open feed system, 12 feet of 4-inch hot-water pipe, and patent joints complete, £4 4. Delivered free to any station. Discount for cash. Cost of apparatus complete for Greenhouses as below:— 10 x 6 feet .. £4 14 0 20 x 10 feet .. £7 0 0 12 x 8 feet .. 5 10 0 25 x 12 feet .. 6 16 8 15 x 9 feet .. 5 10 0 40 x 16 feet .. 12 12 4. Prompt quotations for other sizes. Estimates free. Illustrated LIST, with full particulars of these and every description of Fuel, Gas, and Oil Heating Stoves free.

WANTED, at ONCE, a JUNIOR CLERK. A comfortable, permanent, and progressive appointment to a steady and useful office, stating age, experience, and wages expected, to THOMAS S. WARE, Hale Farm Nurseries, Tottenham, London.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Retardments are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Address, and also a Reference to the Advertisement which they wish Repaid.

SCOTCH GARDENERS.—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting reception, and will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

Gardeners.

THOMAS KENNEDY AND CO. have on their Register a number of first-class GARDENERS, FOREMEN, &c., wishing employment, and will be pleased to furnish particulars to any one in want of same.—THOMAS KENNEDY AND CO., 108, High Street, Dumfries, N.E.

Gardeners, Under Gardeners, Bailiffs, &c.

W. M. CUTBUSH AND SON have at the present time on their List Men whose characters will bear strict investigation, and such as from their personal knowledge can be recommended as abilities, &c.—Ladies and Gentlemen requiring either of the above can be suited with reliable, first-class men by applying to Wm. Cutbush & Son, Highgate Nurseries, London, N.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving Applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

To Gentlemen and Growers.

MANAGER, where Choice Fruit, Cut Flowers, &c. are required to be grown extensively in the market.—Writer, thoroughly experienced, is open to engagement as above.—G. H. J., Athelstan Road, Harold Wood, Rumford.

GARDENER (HEAD), age 32.—Mr. LEACH, Head Gardener, Albany Park, Guildford, can highly recommend a thorough first-class Gardener.—Address as above.

GARDENER (HEAD).—Age 38, married, no family; good all round man in every branch. Highly recommended.—GEORGE MORRIS, Chapel Square, Kingston St. Neots.

GARDENER (HEAD).—Good Grower of Choice Fruit, Flowers, and Vegetables, also Early and Late Forcing Glass, and ability, sobriety, and industry.—Colbrook Place, Twickenham.

GARDENER (HEAD), to any Lady or Gentleman.—Age 33, married; has a thorough practical knowledge to teach the processes, including Orchids. Two years' good character.—B. J., Shaftesbury Road, Southsea, Hants.

GARDENER (HEAD).—Age 30, married; thoroughly practical and experienced in all branches of the profession. Good references from past and present employers.—RODMAN, John Waterer & Sons, American Nursery, Bagshot, Surrey.

GARDENER (HEAD WORKING).—Age 39, married, one girl (age 11); thoroughly experienced. Six years' character; seven previous.—W. J., 47 Upper Park Road, Ham,stead, London, N.W.

GARDENER (HEAD WORKING).—Age 35, married; thoroughly practical in every branch of the profession. Twenty years' experience; under-garden, Poultry, &c. Three years in last situation.—A. E., 50, Belsize Road, St. John's Wood, N.W.

GARDENER (HEAD WORKING), where one or two are kept.—Age 29, married, one child; fifteen years' experience in Early and Late Forcing; also Stone and Greenhouse Plants, Flowers, and Kitchen Gardens. Good character from present and previous places.—E. BUCKETT, Paddock Wood, Kent.

GARDENER.—Sir HUMPHREY DE TRAFALGAR will be glad to recommend his Gardener, a man who gives him a nine years' character. Leaving through four last situation.

GARDENER, where three or more are kept.—A GENTLEMAN can highly recommend his Gardener. He has lived with him four years, has been used to Viney, Orchard House, &c. and also to care of Grass Land. Is an exceedingly trustworthy and active man. Wishes to find a situation above 3s. 6d. Harpenden Court, Henley-on-Thames.

GARDENER (where help is given, or SINGLE HANDED), age 22.—Mr. A. LEECH, Head Gardener to E. Hibbert, Esq., Ashby St. Legers, Lodge, Rugby, can with confidence recommend a young man as above.

GARDENER (SINGLE-HANDED), or where a little help is given.—Age 46, married, when suited.—R. SCOTT Gargrave, Leeds, Wares.

GARDENER (UNDER).—Age 23; good reference from large Gardens.—J. HOUSE, Police Station, Cheddington, Crowthorne.

To Gardeners.

GARDENER (UNDER).—Age 20; strong, willing and active. Good character.—GARDENER, Fitcham, Heath-head, Surrey.

GARDENER; age 40, Scotch.—EDWARD GEORGE, for the last six and a half years Gardener to J. W. Baura, Esq., M. P., Ockenendon, Cuckfield, Sussex; and previously for eleven years Gardener to the Earl of Lancaster. Has had another engagement owing to his lady employer leaving Ockenendon, through the expiration of the lease. Advertiser has had great experience in all branches of Gardening, and has been especially successful in the profitable Culture of Fruits under Glass. Reference kindly permitted to J. W. Baura, Esq., 14, Berkeley Square, W.—21, Stamford Road, Fulham, S.W.

FOREMAN.—Age 24; ten years' experience.—Good testimonials and references.—Recommendation from last situation.—J. LIDDIKAT, Wethersfield, near Braintree.

FOREMAN, in the Houses, in a Gentleman's establishment.—Age 27; eleven and a half years' experience in all branches. Good references.—J. ROGERS, Backs use's Nurseries, York.

FOREMAN, in the Houses, in a Nobleman's or Gentleman's establishment.—Age 21; good practical experience, &c.; with excellent character and Estominal from Mr. Quirk, Thingwall Hill Gardens, Woodchurch, Burkenhead.—R. GRAHAM, 39, Union Street, Bedford.

To Nurserymen.

FOREMAN (GENERAL), and PROPAGATOR.—Advertiser, who is filling the Trade, would like to see one or two men who are good in Fruit, Roses, Rhododendrons, Conifers, and routine of the Trade in general. Sixteen years' experience. Unquestionable character as to honesty, sobriety, &c.—A. B. J., King Street, Rock Ferry, Birkenhead.

SPECIAL NOTICE.—

On and after Jan. 1, 1887,

the Price of the

"GARDENERS' CHRONICLE"

will be

Reduced to Three Pence.

To Nurserymen.

FOREMAN PROPAGATOR or GROWER. Good experience in the Cultivation of Plants.—W. R., Longland's Nursery, Sidcup.

JOURNEYMAN or FOREMAN.—Age 24; eight years' experience in all branches. Excellent references from large establishments.—R. W., 35, Elgin Terrace, Macla Vale, N.W.

JOURNEYMAN (FIRST), in the Houses.—Age 27, single; seven years' experience. Good references.—GEORGE BARKER, The Nurseries, York.

JOURNEYMAN (FIRST), in a good establishment.—Age 23; eight years' experience in good places. Good character.—J. BAILEY, The Gardens, Franks Hall, Darford, Kent.

JOURNEYMAN (FIRST), in a good establishment.—Age 24; nine years' experience in good places. Two years in last situation.—G. TILLEY, Thorney, near Peterborough, Cambs.

JOURNEYMAN (FIRST), Indoors, in a good establishment; age 22.—Mr. C. MARSHALL would be pleased to recommend the above to any Gardener requiring a steady young man.—C. MARSHALL, Arbury Gardens, Nuneaton, Warwickshire.

JOURNEYMAN, in the Houses.—Age 19; good character, obtained to two Gentlemen's Gardens.—A. DOWNHAM, Albany, Little Hadham, Herts.

IMPROVER, or UNDER GARDENER.—Age 19; good references.—GARDENER, Woodhorpe House, Nottingham.

TO NURSERYMEN, &c.—Wanted by a young man (age 20) to work under glass, where two or more are kept. Good knowledge of Stone and Greenhouse Plants, Cucumbers, Tomatoes, Propagating, &c. Six years' experience in a Nursery.—S. J., Bazar Agency, Crewkerne.

HOLLOWAY'S OINTMENT and PILLS.

As the seasons change the climatic variations warn us all to be careful, most especially is it incumbent on the aged, prone to bronchial attacks, ulcers, and similar debilitating disorders, to have them removed, or worse consequences will follow. These remedies are their sheet anchors; on their powers all may confidently rely. The Ointment not only soothes their sores out of sight, but expiates the source of mischief, extracts the corroding poison, and stimulates Nature to fill up the ulcer with sound, healthy granulations, that will abide forever. Under this treatment, but 12s. soon become sound, scorbatic skins cast off their scales, and scrofulous sores cease to annoy. Such hope for the diseased was unknown in former days.

BOULTON & PAUL, HORTICULTURAL BUILDERS, NORWICH.

Boulton & Paul's PLANT FRAMES are always in stock, ready to be sent away on receipt of order. They are made of best, sound, red deal, sawn from the best trees in the forest to our special requirements, and seasoned in a proper manner. The FRAMES are of 1 1/2 in. boards, 13 in. high in front, 2 1/2 in. high at back, and 32 in. at the ridge, bolted at the corners, and easily taken to pieces if required. The LIGHTS are 2 inches thick, arranged to turn over, front or back, and provided with set-screws for ventilating, and the whole painted four coats. The Glass is ENGLISH, 21-oz. weight. PACKED and sent CARRIAGE PATH, to any station in England and Wales, to Dublin, Belfast, London-derry, Cork, Glasgow, and stations equivalent. Cases are allowed in full when returned.

Wednesday Next.

3,000 LILIUM AURATUM, from Japan, very fine bulbs; 2,000 IBERIDIAN, in very fine condition; 1,000 SPECIALLY selected plants; 500 CAMELLIAS, AZALEAS, PALMS, and other PLANTS; 500 English-grown Standard and Tree ROSES, a choice assortment of English-grown LILIES and other hardy BULBS, Barr's DAFFODILS, LILY of the VALLEY, 500 SPIRÆA JAPONICA, &c.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on WEDNESDAY NEXT, December 8, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Friday Next. CUTILEYA LAWRENCEANA. A wonderful importation of this beautiful Cutileya, just received in the best possible condition, including masses of extraordinary size well furnished with leaves.

THE ENTIRE IMPORTATION will be offered without the least reserve.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. F. Mau, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, December 10, at half-past 12 o'clock precisely, a marvellous importation of this grand CUTILEYA, from the Roraima Mountains collected and sent home by Mr. J. D. Osmer (by the R.M.S. 'Vivia', who has been travelling and collecting for some 10 or 15 years past.

The consignment has arrived in the very best condition, and the plants have the appearance of having been gathered but a few days, being particularly fresh and healthy. Many of the plants consist of extraordinary masses with from 90 to 200 red bulbs full of leaves.

This extremely beautiful Cutileya is described in the 'Gardener's Chronicle,' March 14, 1885, p. 33; March 21, pp. 374 and 375; and August 8, pp. 408 and 410 of the same year.

It has also been recently figured in the 'Keichenbachii,' Part III.

The entire importation will be sold without the least reserve, as the whole of the lots must be disposed of, Mr. Mau having no place to accommodate them.

On view morning of Sale, and Catalogues had.

Flowering Orchids, December 21.

SPECIAL SALE FOR CHRISTMAS DECORATION. MESSRS. PROTHEROE and MORRIS will take place above the other.

IMPORTANT TO MARKET GROWERS. MESSRS. PROTHEROE and MORRIS are instructed to SELL by AUCTION, at an EARLY DATE (unless an acceptable offer be made to rent or purchase be made previously), the LEASE of the NURSERY and about 20,000 feet of GLASS, all in capital working order. Ground rent very low.

Arrangements can be made for allowing a portion of the money to remain, thus bringing the property within the reach of small capitalists.

Further particulars will appear next week, and in the meantime can be obtained of the Auctioneers, 67 and 68, Cheapside, E.C.

TO FLOWER GROWERS.—We hold SALES BY AUCTION in our Yards, in the Market Hall, every TUESDAY, THURSDAY, and SATURDAY. Growers will find it a great advantage to purchase here forwarded every week, or earlier if desired.

WANTED, small NURSERY, with Glass

Erection, within a few miles of London. State price, with particulars, to A. B. & Co., Abbey Lane, West End Lane, Kilburn, N.W.

 WORCESTER.

THE EARLIEST OF ALL POTATOS.

SHARPE'S VICTOR.

Sharpe's Victor is a seedling raised from the Alma Kidney and the old early short-round potato. It is earlier than any present variety, and having a very short top it is especially suitable for frame cultivation. Its precocity is such that it can be had fit for the table in eight weeks, or less, from the time of planting, and there is no difficulty in securing new Potatos for the table every day in the year. Victor is a flattened roundish oval in shape, with a beautiful clear skin and extremely shallow eyes, being one of the handsomest as well as the heaviest cropper of any variety adapted for frame work, or for a first early crop outdoors. It is dry and nicely when cooked, and the flavour and the quality of the flesh are superior to nearly every other variety at present in use.

Several seasons' trials have fully confirmed all that has been said in favour of the Victor Potato. It is proved to be the earliest, most prolific, and best flavoured of all the early Potatos; and for pot culture is unrivalled.

Price, 6d. per Pound.

Messrs. J. & J. ELLISON write as follows:—

"Mr. USHER, Gardener to C. H. Johnson, Esq., Thorngub Hall, planted Victor Potatos on January 25, and placed a dish on his employer's table on March 8; from planting to picking being only three weeks and four days."

"Mr. MERVILLE, Gardener to Mrs. Harmsby, St. Vincent's, Grantham, has this season grown the Victor Potato fit for table in six weeks from planting."

 FERN NURSERY, SALE MANCHESTER.

FRIDAY NEXT.

CATTLEYA LAWRENCEANA,

A wonderful importation of this beautiful Cattleya just received in the best possible health, and including masses of extraordinary size, well furnished with leaves.

The Entire Importation will be offered without the least reserve.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. F. MAU, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, December 10, at half-past 12 o'clock precisely, a marvellous importation of this grand Cattleya, from the Koraima Mountains, collected and sent home by Mr. J. D. Osmer (by the R.M.S. Nile), who has been travelling and collecting Orchids for many years.

The consignment has arrived in the very best condition, and the plants have the appearance of having been gathered but a few days, being particularly fresh and healthy. Many of the lots will consist of extraordinary masses with from 90 to 100 red buds full of leaves.

This extremely beautiful Cattleya is described in the *Gardeners' Chronicle*, March 14, 1885, p. 338; March 21, pp. 374 and 375; and August 8, pp. 168 and 169 of the same year.

It has also been recently figured in the *Reichenbachia*, Part III.

The entire importation will be sold without the least reserve, as the whole of the lots must be disposed of, Mr. Mau having no place to accommodate them.

On view morning of Sale, and Catalogues had.

Continental Nurseries, Ghent, Belgium.
Established 1870.
AUGUST VAN GEERT begs to offer to the Trade the following well grown **PLANTS**, of which he has a nice healthy stock still on hand—

FERNS—TREE FERNS.
Colonial and Indian Exhibition, Victoria Court.
 The whole magnificent and well-established, Victorian importation of these stately and well grown Ferns are now on offer. The plants are clean and in rude health, and comprising **DICKSONIA ANTARCTICA**, stems from 6 inches to various and most useful heights up to 8 feet. Prices from 5s. to 20 5s. **TODEA BARBARA**, magnificent specimens, from 2 1/2 to 5 1/2 feet. Ferns I can urgently recommend for any position of trying nature. It is admirably adapted for an entrance hall, being of a dwarf and pedent habit and the most verdant of green imaginable.
 A magnificent lot of that feathery Fern, **ASPIDIUM VIVIPARUM**, grand plants, in 3 1/2 and 2 1/2, from 24s. to 25s. per dozen. Two or three dry trunks of **DICKSONIA ANTARCTICA**, 18 to 20 feet.
 Also a few tons of white Australian gold-producing **QUARTZES**, useful for Rockwork, Waterfalls, &c.
 To be early and immediate inspection invited, also orders executed through post, with all despatch and carefully packed, to ensure safe delivery to all parts. Money orders payable, Old London Office, in Exhibition.

CHARLES SHARPE & CO., SLEAFORD

NEW PEA, SHARPE'S QUEEN.

2s. per Half-pint sealed packet, post-free.

2s. per Half-pint sealed packet, post-free.

OUR NEW PEA—QUEEN, raised by Mr. Culverwell, surpasses everything we have ever had the pleasure of submitting to our Customers, in habit, cropping qualities, colour and flavour; it is the perfection of a Pea for every purpose, and, by successive sowings, so continuous a crop can be obtained, that it will be almost unnecessary to cultivate any other variety. The QUEEN is a Blue Wrinkled Marrow Pea, about 2 to 2½ feet in height, of a sturdy branching habit; it requires to be sown thickly, as the pods are produced from the very bottom of the plant to the top. The pods are large, green, slightly curved, and so filled with Peas that when opened it would appear impossible they could be contained in the pod. The Peas are large, oval, deep-green, and of a delicious flavour when cooked. We feel we cannot say too much in its praise, and are confident our Customers will agree with us, it is the very best Pea ever sent out.

SIR F. A. MILBANK.

2s. per Half-pint sealed packet, post-free.

2s. per Half-pint sealed packet, post-free.

SHARPE'S SIR F. A. MILBANK PEA.—This, one of Mr. Culverwell's many excellent introductions, is a Blue Wrinkled Marrow much of the Paragon type in habit and growth, but earlier, and differing in being of a beautiful dark grass-green colour, and even more prolific than that celebrated variety; the pods are produced in abundance, are large, square, and closely filled with the extra large dark green Peas, so closely packed that it would appear when opened as if the pods could scarcely have contained them. The flavour is all that could be desired by the most fastidious connoisseur, and in every respect it is a variety that we can with the greatest confidence recommend, either for exhibition or table purposes. It is robust and hardy in constitution, and may be sown early; for Market Garden purposes it cannot fail to prove a great acquisition.

SHARPE'S—TRIUMPH—NEW PEA.

2s. 6d. per Pint sealed packet, post-free.

2s. 6d. per Pint sealed packet, post-free.

TRIUMPH is a Blue Wrinkled Marrow, of exquisite flavour; the pods are large, well filled with large Peas. The habit is dense and bushy; height 2 to 3 feet. In constitution it is robust and hardy, and is the perfection of Peas either for exhibition or for ordinary use. Sixty-nine pods have been counted on one plant of Triumph—each pod containing nine to eleven large Peas.

SHARPE'S EARLY PARAGON PEA.

1s. 6d. per Pint sealed packet, post-free.

1s. 6d. per Pint sealed packet, post-free.

FIRST CLASS CERTIFICATE, ROYAL HORTICULTURAL SOCIETY, 1884.

Chiswick Report, 1884, accompanied with First-class Certificate:—"PARAGON—A very fine Second Early Variety, and of good quality. Pods large, and well filled." PARAGON is a Blue Wrinkled Marrow of fine flavour; height from 4 to 5 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick-backed, containing from twelve to fourteen large Peas.

PARAGON is the earliest of the large Wrinkled Marrows; it is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops, as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

TRADE PRICE AND SPECIAL LIST OF NOVELTIES FOR 1886 AND 1887, Post-free on application.

CHARLES SHARPE & CO., SLEAFORD.

that affect the chalky soils of this and other countries. This is at present only an "idea," in course of development. The upper part of the mounds are covered with plants in colonies, consisting of *Triptomas*, *Veronicas*, *Rhodiopendron* proreox, so useful a plant in the spring; *Euphorbia capitata*, a pretty subject for carpeting a surface with grey-green foliage—it is prostrate and close-growing; *Polygonum vacciniifolium*, an autumn flowerer, pink; *Thymus azoricus*, very dwarf; *Acroea adurgens*, a New Zealand plant of the order Rosaceæ; *Helleborus niger*; and *H. n. majus*, a splendid variety which bears flowers of an immense size, and with colour equal to that of the type; *Hutchinsia gracilis*, a compact growing form from Bavaria, more tufted than *H. alpina*, the flowers white and produced in spring; *Hypericum reptans*, a fine subject especially when seen from beneath, the habit is creeping, and the plant is very averse to direct sunlight; *Omphalodes Lucilike*, pale blue, rare, is another desirable carpet plant, especially as it is very dwarf; *Arnebia echioides* is almost a constant flowerer on the rockery. For a loose crumbling wall in a warm place, *Artemisia sericea*, is a useful plant, the foliage is grey and it is very dwarf. A group of rare Saxifragæ were accommodated in a little colony all to themselves, such tiny plants admitting of no neighbours. The species composing this exclusive set were:—*S. aretoidea*, *S. a. pumila*, *S. cesia minor*, of which there was a large patch; *S. marginata*, *S. Bursieriana*, *S. Fredrici Auguste*, *S. squarrosa*, *S. Rudolfiana*, *S. Tombeana*, *S. Kotschy*, and *S. patens*. Considering that most of these are from the border-line of perpetual snow, their growth at Broxbourne is very satisfactory. *Alyssum saxatile variegatum* in a clump was very telling. Fancy any gardener lining out this, or, indeed, any of these alpine, with line and rule, to fit them in a carpet or any other bed! The autumn-flowering *Erica Mawiana*, rosy-flowered and dense of habit, was in full bloom at the time of our visit. *Tunica saxifraga*, an immense flowerer, of pale lilac colour, does well here. *Veronica rupestris* was for the second time in flower; it is only 2 inches high as to foliage, but the flower-spike reaches to the height of 4 inches. *Genista pilosa* must not be passed over, it is similar in habit to *G. prostrata*, and flowers in spring; *Silene maritima rosea* is a capital fast-spreading species, well fitted to cover ground set with bulbs. It does not root at the nodes, and dies away in the winter, starting into active growth late in the spring.

Campanula Hosti alba is better than *C. pulla alba*, having bigger bells; another bell-flower was seen in *C. pelviformis*, one of *M. Freebel's* hybrids, with pale blue flowers, and the whole plant lowly in habit. Where a beautiful foliage is sought, *Potentilla verna* should be obtained; *Erigeron microcratum*, with a leaf like that of the common Daisy, but sharp pointed; a very late flowering *Aster* is found in *A. grandiflorus*, the flowers come not in umbels, but singly, and are of a fine blue colour. Every one should possess *Pimphago Larpenite*, the dark blue flowers coming in great quantity; it loves a sunny dry place best.

In the intersecting chasm spoken of previously we found planted, the north or sunless side *Saxifragas*, *Silenes*, and *Thymes*; on the sunny slope were *Cyrtopodium calceolus*, *Lithospermum prostratum*, *Zauschneria californica*, bright and varied; *Rubus phœniculatus*, (illustrated in our Number for Sept. 18, 1886, p. 365) a strong rampant plant, well in fruit, hung over the central chasm, being planted on the northern side. The south slope of the rockery is of *Kentish rag*, the crumbling of which under weather influences furnishes a fine soil for many species of alpine, and seedlings spring up in it with no trouble whatever. A visit paid to this nursery in spring or early summer would disclose other alpine gems which at the time of our visit were out of flower, or had disappeared for the season.

New Garden Plants.

ODONTOGLOSSUM LUCIANIANUM,

nov. hybr. nat.*

THIS is a very fine new *Odontoglossum*—a recent discovery of Mr. Bangerth, one of the Lindenian collectors, in Venezuela. It may be a hybrid between *Odontoglossum nevium* and *O. odoratum*. It is quite distinct from *Odontoglossum Dormaniannum*, *prestantis*, *crocidipterum*, which with *odoratum*, *nevium*, and *circosum* (not *cirosus*, as is so often written by mistake) form one group. I learn that the bulbs are like those of *Odontoglossum odoratum*, but more slender and longer, and without any trace of those impressions which are so characteristic in *Odontoglossum nevium*. The flowers are racemose. The sepals and petals are lanceo-cuspidate, like those of *O. odoratum*, whitish with a flush of lightest sulphur, and with fine dark purple-brown spots and stripes. The basilar part of the lip is very short, very low; the anterior blade is large, oblong, cuspidate, crenulate, wavy, velvety on the surface, white, with a large transverse sepia-brown blotch in front of the callus, consisting of two lamellæ, each with two blunt teeth. Columna more slender than in *Odontoglossum nevium*, and plumper than in *O. odoratum*, white, with some brown markings under the stigmatic hollow, and a few red lines outside, near the anterior angles. Wings very narrow, linear aristate. This novelty is dedicated with pleasure to Most. Lucia Liden, who most kindly sent me numerous satisfactory materials which came into his hand. *H. G. Rehb. f.*

[Our Latin dictionaries have *circus*, *circatus*, not *cirosus*. The Greek *κίρκος*, according to similar authority, means tawny, yellow. Ed.]

L. ELIA PUMILA (*Rehb. f.*) *CURLSANA*, nov. var.

This belongs to the variety *spectabilis* (see *Florist*, iii., 92, *fol.* Lindl. Paxt., *Fl. G.*, i., 44). Dr. Lindley called that "a finely blown specimen of *Cattleya pumila*." For my own part I venture to state that I have always found in this *spectabilis* the mid-keel extended to the anterior disc in so deep rounded and short a keel, such as I never saw it in the genuine *Lælia pumila*. We may see it proposed afresh as a new species "on spec."

Now the novelty at hand is, in brief, a *Cattleya Massangeana*, or nearly *Nalderiana* translated into *Lælia pumila*. It is quite coloured on the same principles. Sepals with few dark streaks. Petals on both margins with numerous similar oblique reticulating parallel lines. Side lacinia of the lip outside with similar dark lines, but inside nearly free of them.

This curious plant is in the hands of Mr. Curle, of Melrose, a keen amateur and the possessor of a very nice collection of Orchids, as is stated by the kind senders, Messrs. W. Thomson & Sons, Tweed Vineyard, Clovenford, Galashiels, N.B. *H. G. Rehb. f.*

ODONTOGLOSSUM BLANDUM ROSSIANUM, nov. var.

A delightful new variety. It has brown spots on the sepals and petals. The basilar part of the lip is fine yellow, with red spots. The calli are also yellow. The blade of the lip has light purple spots and streaks. It was kindly sent me by Mr. H. F. Ross, of Castagnolo supra Firenze. *H. G. Rehb. f.*

ZYGOPETALUM LEOPARDINUM, *Rehb. f.*, *hyb.*

Angl. ex hort. Veitch, 1885; *supra*, Aug. 14, p. 199.

A fresh seedling from this lovely artificial hybrid has just flowered with Messrs. James Veitch & Sons. The documents are at hand, thanks to Mr. Harry Veitch. They prove once more what variety there is in these hybrids. The flower at my side, Mr. Seden's last pride, has the anterior blade of the lip with some white, partly lobed dashes, which look wonderful on the blue ground. It is only comparable to what may be seen in some china, scarcely in any picture in water or in oil colours. The spots of the sepals and petals are more numerous, and smaller. *H. G. Rehb. f.*

* *Odontoglossum Lucianianum*—Pseudobulbi pyriformibus, attenuatis, levibus; floribus racemosis; sepalis tepalis lanceo-acuminatis, labelli hypochilii valvulis subquadratis humilibus, epichilo oblongo-ovalato cuspidato marginibus crenulatis, callis geminis parallelis utraque obtuse ascendentes, superficie labelli velutina; columnæ alis angustissimis linear-aristatis. Ex Venezuela, mont. eze viator Burgeroth. Accept. ab. exc. Luciano Linden, cui cum magno gaudio dicatum. *H. G. Rehb. f.*

CRASSULA RHOMBOIDEA, *N. E. Brown*, n. sp.

A dwarf species of neat habit, but of no great horticultural merit, sent to Kew in 1835 by Mr. Dunn, from the Transvaal.

Perennial, 2½–3 inches high (perhaps growing somewhat taller), quite glabrous, but glaucous on the young stems, leaves, bracts, and calyx. Leaves opposite, glaucous-green, punctate-dotted, rhomboidal in outline, acutish, hunched just above the middle, by the apex being deflexed at an oblique angle at that point, which is the thickest part of the leaf; the upper surface is convexly flattened, the under surface roundedly keeled; some leaves on the older imported part of the plant are an inch long, three-quarters of an inch broad, and half an inch thick at the thickest place; but those on the portion of the plant grown at Kew are much smaller, being 9–11 lines long, 4–5 lines broad, and 2½–3 lines thick. Peduncle terminal, half an inch long, divided into a small, few-flowered, flat-topped cyme, three-quarters of an inch across. Bracts minute, half to 1 line long, narrow, glaucous. Branches of the cyme and pedicels each about a quarter of an inch long, reddish. Calyx very broad and obtuse at the base in proportion to its size, about one-eighth of an inch in diameter, the ovate, obtuse, bluntly keeled lobes three-quarters of an inch long. Corolla 2 lines long, 2½ lines in diameter, campanulate, with the tips of the petals spreading; petals oblong-lanceolate acutish, pale flesh-coloured with a pink dorsal middle line. Stamens a little shorter than the petals; filaments white, anthers pale yellow, pollen bright yellow. Hypogynous glands transverse, three times broader than long, truncate, yellow. Carpels erect, pale green with pink tips. A native of the Transvaal. *N. E. Brown.*

CRASSULA IMPRESSA (*N. E. Br.*)—SCHMIDT, *Regl.*

The plant figured in the *Gartenflora* of this year, at t. 1253, as *C. Schmidtii*, is the same as that which I described in 1879 in these columns (vol. xii., p. 328), under the name of *S. impressa*. It is a very pretty, neat growing species of dwarf habit, with linear-lanceolate acute, thick fleshy leaves, retorsely ciliate on the margins, green or purplish in colour and impressed-punctate above; and having terminal cymes of deep pink flowers. *N. E. Brown.*

AUSTRALIAN AND NEW ZEALAND TREES IN ARRAN.

(Continued from p. 683.)

GUM TREES (continued).—The *Giant Gum tree* (*Eucalyptus amygdalina*): New South Wales, Victoria, Tasmania.—The Peppermint tree of Tasmania; the Stringy-bark and Gippsland Box of New South Wales; the Red Gum and also the Mountain Ash of Victoria, where in Gipps land (south-east of Australia—the part of Australia which, in climate and productions most resembles Britain) this tree is most conspicuous. This is the tallest, and in weight of timber, the greatest tree in the world. Baron Mueller mentions one of 471 feet in height, and another 69 feet in circumference at the ground and 15 feet in circumference at the height of 210 feet. This is the species from which the Eucalypt oil of commerce, now so much imported, is mainly obtained, for though its leaves, from the hardness of their cuticle, do not diffuse so much of the odour of this oil as do those of the Blue Gum—in which, when the plant is young the cuticle is thin and soft—yet it contains more than four and a half times the quantity of oil. There are two varieties of this species, the "one grows in the open plains of Australia, and has small narrow leaves and a rough brownish bark;" the other grows "in sheltered, well-watered forest gloes, and has a smooth stem and broad leaves." The great monarchs of the Australian forest are of the second of these varieties, which Baron Mueller proposes to call *E. amygdalina* var. *regans*. Those growing in Arran were from a packet of seed which produced both varieties. Four were planted in Arran, two of each; but both of the ordinary variety were killed by the frost of 1880–81, and one of the *regans* variety was blown over by the wind. One only remains, but fortunately it is the giant (*regans*) variety. I conclude that it is this variety, because, when young, the leaves were roundish in shape, alternate, and provided with a short stalk, while those of the other were longish, sessile, and opposite. The variety that survives also grew with more rapidity than the other. I may add,

that seed sent me by Baron Mueller, and marked simply *E. amygdalina*, produced the common variety—the kind which would have been killed in Arran. Had it been the giant species he would almost certainly have named it as such. I conclude, therefore, that Arran has the honour of growing the grand monarch of the Australian forest. It is in an admirable situation in the garden at Cromla, where it is sheltered on the north and east by a wood. It was sown in 1871, and is now 28 feet in height and 14½ inches in girth, and adds annually 2 feet to its height and 1½ inch to its girth. Its leaves are 8½ inches long and three-quarters of an inch in breadth. I am happy to add that this year it has bloomed, being the first time, I believe, that it has bloomed in the open air in Britain. It began to bloom toward the end of August. (This was a late season. In an ordinary season it would bloom at the middle of the month.) At the same time a large standard Myrtle near to it also began to bloom. The Myrtle and Gumgenera are very closely related, and the bloom

named the "Weeping or the Drooping Gum." Having so many names, it is no doubt a very distinguished Gum. I hope, and also expect, that in Arran it will prove worthy of its many names, and be very graceful, and also contrast well in colour with Gums of lighter hue. Two have been planted this year in Arran—a very small one at Captain Brown's, Lamlash; and a larger one at Cromla, Corrie.

The Red Box Gum (*Eucalyptus polyanthema*, syn. *Lignum vite*: South Eastern Australia).—It is named Box from the shape of the leaf; *Lignum vite*, from the hardness of its wood. "It attains a height of 150 feet, furnishes an extremely hard lasting timber, and for fuel it is unsurpassed." (Mueller.) One was planted this year at Cromla, Corrie. It is about 4 feet in height.

The Umbrella Gum (*Eucalyptus cordata* var. *urnigera*: Southern Tasmania).—"The variety *urnigera* is particularly hardy, and may become of sanitary importance to colder countries in malarial regions, the foliage being much enlaced with antiseptic oil;

It was wholly unprotected, yet not a leaf was even browned. It is now 21 feet in height and 9½ inches in girth, and is growing yearly on an average 3½ feet in height and 2½ inches in girth. There is encouragement to plant! Sown at one's birth, should one reach the age of seventy, it would then be a tree 230 feet high with a trunk 14½ feet in girth. The specimen at Lamlash grows near the highway facing the sea, and is fully seen from both. It is very handsome, and has begun to assume a weeping habit. When young, though the leaves are different yet in general habit it much resembles a vigorous Weeping Birch. The leaves are half a foot in length and 1 inch in breadth (2½ inches shorter, but half an inch broader than those of the Giant Gum, *E. amygdalina*), and are attached by a short stalk. It is named "the White Gum" from the whiteness of its trunk, specially after its bark is newly shed, when it approaches the colour of the Silver Birch; the "Weeping Gum" from its weeping habit; the "Flooded or Swamp Gum" from the nature of the ground in which

FIG. 137.—VIEW IN MESSRS. PAUL'S GARDEN AT BRONXBOURNE. (SEE P. 712.)

of the two is similar in size and in appearance. The tree can be seen from the highway, and when it rises above the surrounding trees, which it will soon do, it will be well seen also from the sea. Will it become a giant? Time will show. Certainly it will not grow to the height of 471 feet.

The Manna Gum (*Eucalyptus viminalis*: South-Eastern Australia, syn. the Weeping Gum, the Blue Gum, the White Gum, the Wand Gum).—"On poor soil only, a moderate-sized tree, generally known as the 'Manna Gum,' this being the only species that yields copiously the crumb-like, meltiose Manna; but in the rich soil of the mountain forests it attains gigantic proportions, rising to a height of rather more than 300 feet, with a stem occasionally 45 feet in circumference. Here it has a cream-coloured, smooth bark, and is locally known as the 'White Gum.' In other districts it is named the 'Blue Gum,' from the colour of its leaves." (Mueller.) We would rather call it the "Purple Gum," as the colour is purplish-blue, while that of the true Blue Gum (*E. globulus*) is blue-white. From the slenderness of its branches it is named the "Twiggy or Wand Gum" (*E. viminalis*), and from their pendant habit it is

greatest height 150 feet; stem circumference, 18 feet." (Mueller.) This is a beautiful tree, the habit being spreading and drooping; the foliage dark green and glaucous. A plant about 3 feet in height grows at Strabane, Brodick.

The White Gum (*Eucalyptus pauciflora*, syn. *coriacea*; the Weeping Gum, the White Peppermint tree, the Flooded or Swamp Gum: New South Wales, Victoria, Tasmania).—"A tree of handsome appearance, with a smooth white bark and generally drooping foliage; it attains considerable dimensions, grows best in moist ground, ascends to alpine heights, and shows a preference for basaltic soil. Horses, cattle, and sheep browse readily on the foliage, and it is locally a 'stand-by' in bad pastoral seasons. Its timber is used for ordinary building and fencing purposes." (Mueller.) In the spring of 1879 I received the seed of this species gathered on the Blue Mountains, New South Wales, and kindly sent me by Mr. Bailey, Government Botanist, Queensland. I sowed it at once. The following year, when only about 9 inches in height, it was planted at Captain Brown's, Lamlash. The severest winter followed that we have had for a quarter of a century,

it frequently grows; and the Peppermint tree" from its perfume.

Summary.—Already nine species of *Eucalyptus* are growing in Arran. These include the greater number of the most interesting species. In Arran they do not in general grow with the wonderful rapidity of Gums in Australia, though, as has been mentioned, the Blue Gum adds 4 feet yearly to its height, and the White Gum 2½ inches to its girth; yet in consequence of the moist, mild, and comparatively uniform temperature of this island, and also the influence which sea air is known to exert in adding to substance and size in foliage, it is believed that they are as luxuriant (the alpine Gum much more luxuriant) as those of Australia.

They are all evergreens, and many of them, especially when the plants are young, begin in mild winters to send forth young leaves as early as February, when their fresh reddish-green tints are very refreshing to the eye. They also continue to grow and look fresh till winter; and now that they have begun also to bloom, these natives of the antipodes cannot fail speedily to become among the most conspicuous forest ornaments of this wonderful island.

A MOST BEAUTIFUL ARAUCARIA.

It may be mentioned that a most beautiful and most perfect *Araucaria* (*A. imbricata*) adorns the height in front of the house alongside of Captain Brown's, at Lamslash. It is most prominent, as it is immediately above the head of the new pier. It is of the richest green, and luxuriantly furnished with branches to the very ground.

ACACIAS.

The Blackwood tree (*Acacia melanoxylon*: South-eastern Australia).—This is one of the most valuable of Australian trees, the wood being very beautiful, almost equal to Walnut. It grows to the height of 80 feet, with a stem several feet in diameter. When a seedling the leaves are most beautifully pinnatifid, but in a few years the leaf-stalk becomes the leaf, when the tree assumes much the appearance of a Gum. It has proved quite healthy in Arran where there were two plants; but they grew so luxuriantly that both of them were overthrown by the wind. I have this year 30,000 seeds, to renew the experiment.

The Golden Blackwood (*Acacia penninervis*: Victoria, New South Wales and Tasmanian).—“A tree, 43 feet in height, the young shoots minutely glabrescent. It is so hardy as to occupy sub-alpine localities.” (Mueller.) This grows slowly, but it is very beautiful. A plant grew at Captain Brown's, Lamslash, but it was eaten badly by a sheep and did not recover.

The Black Wattle (*Acacia decurrens*: East of South Australia).—“This *Acacia* is perhaps the most important of all the tannin-yielding trees of the warm temperate zones, and its bark is three times more powerful in tanning property than British Oak bark. It grows to the height of 60 feet, and adds 3 inches to its growth yearly.” (Mueller.) It is a most lovely plant, by much the most beautiful evergreen, growing in the open air in Arran, indeed in Britain. Its Australian name “Feather-leaf,” is most descriptive of its form and texture, while its colour is a beautiful shade of green. At Captain Brown's, Lamslash, a plant grows in the greatest perfection, though, as yet, it has not bloomed. It is 9 feet 4 inches in height, and 5½ inches in girth at 10 inches from the ground, and grows at the rate of 2½ feet in the year. It is stated by Mueller that it is harder than the Blue Gum. In Arran this holds good in the sense that it is more tenacious of life, as frost that would destroy the Blue Gum does not kill it. But it is not harder than the Blue Gum in the sense that it is less liable to receive injury from frost, as it and the Blue Gum grow alongside at Captain Brown's, the Blue Gum being slightly more exposed, yet the frost of last winter did not injure the Blue Gum in the slightest while the Feather-leaf lost much of the growth of the previous year.

The Silver Wattle (*Acacia dealbata*: South-eastern Australia and Tasmania).—“This tree grows to the height of 150 feet, and is distinguished from *A. decurrens* by the silvery or rather ashy hue of its young foliage and by flowering early in spring while the other flower in the beginning of summer.” (Mueller.) There was a tree in Arran, but it died. It was neither so beautiful nor so hardy as *A. decurrens*.

The Golden Wattle (*Acacia pycnantha*: Victoria and South-eastern Australia).—This Wattle grew for several winters at Captain Brown's, Lamslash; but was killed by the frost of last winter. It never thrives, and was in appearance altogether inferior to the Blackwood (*Acacia melanoxylon*), to which it has considerable resemblance.

PALM LILIES.

The Palm Lilies (*Cordylines*) are most interesting, and give a tropical character to a garden. At Cromla, Corrie, three species have grown for several years, and not even the cold of 1880-81 affected them in the slightest. They are—

The Undivided Palm-Lily (*Cordylina indivisa*: New Zealand).—“The stem of this thick and rigid leaved Palm-like species rises to a height of 20 feet, and remains undivided, hence its name. Leaves 5 inches broad, yield the *tea fibre*. Petiole at first erect, berries white.” (Mueller.) Avenues are formed of this species in Australia, as at the Botanic Gardens, Ballarat. It is better adapted for avenues than the other species, as, unlike to them, it does not throw up suckers. It is interesting to know that there is at least one such avenue in Britain—at Rosehill, near Plymouth. [Also at

Menabily, and at Tresco, Scilly]. One might be formed in Arran, where a plant which I sowed in 1873 is now, including leaves, 16 feet in height and is 1 foot 4 inches in girth.

The Lofly Palm-Lily (*Cordylina australis*: New Zealand).—“The stem of this noble Palm Lily attains a height of 40 feet, and is branched; the berries are blue. When in bloom it diffuses a delightful odour.” (Mueller.) It grows in perfection at Cromla, but its stem is not yet divided, nor has it bloomed.

Veitch's Palm-Lily (*Cordylina Veitchii*).—This seems to be only a variety of *C. superbiana*. It grows well at Corrie.

TREE FERNS.

Dicksonia Billardieri (syn. *antarctica*: South-eastern Australia, New Zealand).—*D. Billardieri* is the older name of this Fern, and not *D. antarctica*. It is more appropriate, “as nowhere is it antarctic.” (Mueller.) This stately Fern grows to the height of 40 feet. Sown in 1855, and planted by me at Cromla, Corrie, in 1857, it has now a stem 2 feet 5 inches in girth, and 2 feet 4 inches in height; sends out annually nearly twenty fronds about 6 feet long and 2 inches in breadth, which bear spores abundantly. It adds two and a quarter inches to its height yearly. It lost most of its fronds in 1880-81. This is a magnificent plant.

D. squarrosa.—This has a stem 11 inches in height and 10 inches in girth. Last winter for nearly two months the entire plant was buried under snow; the leaves suffered somewhat, but the plant was not injured. It also lost most of its fronds in 1880-81. The following Ferns (not Tree Ferns) are also hardy at Cromla, Corrie:—*Todea superba*—its fronds were destroyed in 1880-81, but it soon recovered; *Todea hymenophylloides*; *Adiantum pedatum*, *Asplenium Belangeri*, *A. lucidum*, and *A. falcatum* were all uninjured. *Pteris scaberula* and *Trichomanes radicans* have been added since.

CASUARINEÆ.

These are “the most singularly picturesque trees in Australia, and furnish one of its best timbers.” (Mueller.) They would grow in Arran were they not so brittle. The He Oak (*Casuarina equisetifolia*), which attains a height of 150 feet, grew vigorously from 1831 to 1835 in the Brodick Castle high garden; but at length it was snapped by the wind. The She Oak (*C. quadrivalvis*) grew at Captain Brown's, Lamslash, but met with a similar accident. I much regret that this most interesting species is not now represented in Arran. Would they have stood such a winter as 1880-81?

THE GRASS TREE.

The Grass tree (*Xanthorrhoea arborea*: New South Wales).—The “Black Boy” of the colonists, specimens of which were exhibited at the Indian and Colonial Exhibition of this year, is one of the most singular of the plants of Australia. It resembles a great Rush with a tree stem, but in reality it belongs to the Lili family. The stem is sometimes 6 feet in height, with a girth of 2 feet; the flower-spike 3 or 4 feet high. The leaves are 3 or 4 feet in length and two to three lines broad. A specimen was this year planted at Captain Brown's, Lamslash.

PALMS.

Chamerops Fortunei (North China).—“The hardiest of all Palms is *Chamerops excelsa*, one of the Fan Palms, which has stood 3° F., only having its roots protected by a little litter. This grows at the rate of a foot a year at Melbourne. *Chamerops Fortunei*, the Chusan Palm, from North China, is a variety or closely allied species. It attains a height of 30 feet, and also endures considerable cold.” (Mueller.) One of the latter was planted this year at Captain Brown's.

PITTOSPORUMS.

Pittosporum undulatum (South-eastern Australia).—This tree at times attains a height of 80 feet. “Its flowers are delightfully scented.” It has grown for several years in Brodick Castle high garden, and is now 4 feet 3 inches in height.

P. tobiia (Japan).—This grows to the height of 12 feet. Its flowers, like those of *P. undulatum*, are white, and very fragrant. The extreme thinness of the lily-shaped leaves is very remarkable. One was planted this year at Captain Brown's.

P. Ruffii.—One planted in the same place this year.

MISCELLANEOUS PLANTS BLOOMING IN ARRAN.

Buddleia globosa (Chili and Peru).—Its orange balls of bloom are very beautiful; *Desfontainia spinosa* (Peru), 8 feet high, flowers from July to January; *Azalea americana* (China), *A. pontica albiflora* (Turkey), *Deutzia gracilis* (Japan), *Myrtles*, *Camelias*, *Banksian Rose* (flowers seldom), blue *Passion-flower* (Brazil), the very beautiful crimson-purple variety of *Veronica Andersoni*, the very beautiful *Erica arborea*, 8 feet high, 18 feet in circumference.

MISCELLANEOUS PLANTS NOT YET BLOOMED.

Euonymus latifolia aurea (Japan), *Photinia serrulata* (China), *Coccoloba vesperiflora angustifolia*, *Eurya latifolia* (Japan), *Quercus suber* (Spain), *Cunninghamia sinensis* (1 foot in girth), *Agalma tomentosum*, planted in 1855, now in excellent health; *Platanus occidentalis* (Levant), 3 feet 9¼ inches in girth; *Osmanthus aquifolius* (Japan), *Odera japonica*, the Cloth of Gold Rose, the Bush Lawyer (*Rubus australis*)—the variety with the leaves reduced to mid-rib, the Tarabeke of New Zealand—very strange-looking, and a bush lawyer indeed; the Pepper tree of Gibraltar, where it grows in great beauty (*Schinus molle*). “From Mexico to Chili, ascending the Andes to about 12,750 feet. A tree thriving in dry and sandy soil, odorous in all its parts, the foliage in bouquets a good substitute for Ferns, and not quickly shrivelling; the jerking motion of leaf fragments thrown into water very remarkable; the somewhat spicy small fruit serving as a condiment.” (Mueller.) I had seen and much admired this tree at Gibraltar. A friend kindly sent me seed from Chili. Planted this summer at Captain Brown's, Lamslash. The wild Olive (*Elaeagnus reflexa*, syn. *japonica*) has grown for many years. The strange Bottle tree of Australia (*Brachychiton diversifolium*), so called from the bottle-shaped expansion above the neck of the stem.

CANTYRE, ARGYLLSHIRE.

Though Cantyre forms part of the mainland of Scotland, yet it is connected with it by so narrow a strip of land that in climate it is insular. It stretches for 30 or 40 miles parallel to Arran and about half-a-dozen miles west of it. The fame of the Australian plants growing at Lady Campbell's, South Park, Campbellton, led me to visit the place. Lady Campbell most kindly took me through her grounds. The most remarkable plant is a magnificent specimen of the lofty Palm-Lily (*Cordylina australis*). I had thought those in Arran had not their equals in Britain, out-of-doors, except in the south of England; but this one at South Park is much superior. Its stem is more than 2 feet (24½ inches) in girth. At the height of more than 8 feet the stem separates into four smaller stems; and about 2 feet higher one of these parts into two, so that in all there are five stems at the top. Including leaves, it is fully 20 feet in height. Last year (1885) it bore four immense spikes of bloom and matured abundance of seed. Some of it was sent to the Botanic Gardens, Edinburgh, from which it was distributed by Mr. Lindsay over Britain, in the hope that, being native, plants raised from it would prove hardy. It has not bloomed this year. It is less than twenty years since it was raised by Lady Campbell from seed. Another remarkable plant is *Pittosporum tenuifolium*. It is 16 feet 2 inches in height; and the stem, near the ground, is 1 foot 10½ inches in girth. It blooms abundantly. The flowers are dusky-crimson in hue and sweetly perfumed. A plant of *P. undulatum* (the Lemon-scented *Pittosporum*), grows beside the other; but it has not yet bloomed. A high wall is covered with an Australian *Convolvulus*. The leaves are small, but the flowers, which are white, are of the size of those of *Calystegia sepium*. The Australian *Salanum aviculare* also grows on the same wall. The New Zealand Tea plant (*Edwardia microphylla*) has bloomed in the greenhouse; there is also in the open air a Blue and a Red Gum. These grow freely till they overtop the wall which protects them from the sea-blast; but when exposed to it they perish.

BALINAKILL, ARGYLLSHIRE.

Balinakill, the residence of William Mackinnon, Esq., is situated on the north-east of Cantyre, and about parallel to the north of Arran. The house is surrounded by carefully cultivated woods, which give shelter to more delicate plants. Here the Urn-bearing Gum (*Eucalyptus urnigera*) is 3 feet 5 inches high; the Little Blue Gum (*E. coccifera*), also 3 feet

5 inches high; and the Cider Gum (E. Gunnii), 5 feet high, all grow healthily.

GADGIRTH, Ayrshire.

Gadgirth, the residence of General Barnett, is on the banks of the Ayr, and 4½ miles from the sea. The soil is light and good, and the place is sheltered by wood and hills in all directions. Here the seed of the hardest of all the Gum trees (*Eucalyptus cocifera*) was sown in the open air in the spring of 1881. It germinated well, and now one of the plants is 12½ feet high, and 3¼ inches in girth. Among the plants raised is one of a most interesting and beautiful variety, the leaves being so covered with a hoary bloom, both above and on the under-side, as to be almost white. Having been transplanted, it is only about half the size of the other: I have seen none at all like to it.

ROSENEATH, DUMBARTONSHIRE.

Roseneath, at the mouth of Gare Loch on the Clyde, is the furthest north that the Gum trees have been tried with success. It is above the 56° of north latitude. It is a most beautiful parish, and in it there is no more lovely spot than that of the Established Church manse. Here the tallest tree in the world, the Giant Gum (*Eucalyptus amygdalina* var. *regans*) was planted in 1876. It grew famously till the winter of 1880-81, when very severe frost cut it to the ground. It sprouted again in the spring, and grew so quickly that, lest it should break, it was topped. It now is, however, 15 feet 4 inches in height and 6½ feet in height, both height and girth being taken at 4½ feet from the ground, as it bifurcates just above this.

Near to the Giant Gum grows a specimen of the Urn-bearing Gum (*Eucalyptus traegeria*). It was planted a few years ago, and has had to contend with a squirrel which ate its bark, and a roe deer that ate its leaves, yet it is doing well, and being much more hardy, may yet overtop its giant neighbour.

I have thus given a full and exact account of the Australian and New Zealand plants known to me as growing in Arran, and in the West of Scotland. This report I will not repeat for some time. Should I, or any one else, at the end of half-a-dozen years, furnish your Society with another report, it is hoped that it will tell of great growth and development. *D. Landsborough.*

EFFECTS OF THE RECENT FOG.

OUT-OF-DOORS any evil effects accruing to vegetation at the present time cannot be directly attributed to fog alone, seeing that we have lately experienced several degrees of frost in addition to the absence of sufficient light. Add to this the natural fall of the leaf and the fact that our native vegetation is less susceptible, as a rule, to changes in the intensity of the light than many exotic subjects, and we have a combination of causes at work in bringing about the phenomenon of serene and decaying leaves, so that changes in that direction out-of-doors are less noticeable at this season than they would otherwise be. Under glass, however, the conditions are very different, and where plants have to be kept in a growing or flowering condition, the difficulties that the cultivator has to contend with are of a serious kind, and all the more so because in a great measure insurmountable. Thin-leaved plants are those most liable to suffer from a diminution of the light, and especially those that are highly sensitive to variations in its intensity, and exhibit the phenomena of sleep. This will be evident by reference to such plants as *Phyllanthus* (*Reidia*) glaucescens, *Poinciana regia*, *P. pulcherrima*, *Casalpinia*, *Calliandra*, and others of that nature which during the week in which we had a continuance of three days' fog exhibited all the appearance of being kept to darkness for a considerable time.

In spite of every care and attention on the part of the cultivator as to temperature and moisture, the other all-important condition to plant life, namely, light, being absent, the leaves or the leaflets, as the case may be, turn yellow, and drop, making the plant for all practical purposes deciduous, although evergreen under ordinary and favourable circumstances. The same unfavourable conditions tell severely on *Victoria regia* owing to its rapidity of growth, and the necessary expedition with which the internal changes must take place. Nor is this confined to subjects of the nature just mentioned, but all

soft-wooded plants suffer more or less visibly, and make the task of the cultivator precarious and unsatisfactory. Orchid growers have also to deplore the failure of *Phalœopsis*, *Angraecum*, and *Cattleya* flowers, especially of the two former. *Poinsettias* have suffered visibly, and are in many cases practically ruined for a season. Fortunately, when we turn to hard-wooded plants the case is more satisfactory, and fine-foliated plants of this class suffer comparatively little from a temporary diminution of the light, provided the leaves are mature. This arises from the fact that changes take place much less rapidly in rigid, leathery, and evergreen leaves, than in those of a thin and membranous texture. *J. F.*

WOODS IN THE LATE COLONIAL EXHIBITION.

(Continued from p. 685.)

CAPE OF GOOD HOPE COURT.—Although but very few of the Cape of Good Hope trees, save, indeed, some of the now naturalised kinds, such as *Pinus Pinaster* and *P. Pinea*, our English Oak, *Quercus pedunculata*, *Populus alba*, and some few members of the *Willow* family, can be considered as suitable for growth in this country, still their remarkable and beautifully grained woods, as revealed in the majority of specimens exhibited, as well as varied uses to which they are applied, make it almost imperative for me to notice briefly a few of such as are of particular interest, or that, from their distinct and beautiful markings, attracted my notice.

No one who has even the faintest idea of timber and its graining could pass unnoticed the beautiful slabs—one plank and two round sections—of *Umzimba* or *Umzumbeti*, for certainly as regards depth of colouring and beauty of arrangement in graining this wood was not surpassed by any other specimen in the whole Exhibition; and if the specimens shown be a fair sample, as regards colour and graining, of the wood as usually grown, then its value for particular purposes must be great indeed. Mr. Hedley, of the Cape Court, informed me that some doubt existed as to the botanical name of the tree that produces this wood, but that *Milletia Kaffra* was that usually bestowed, and by most authorities considered as correct. The wood, which we were informed, is believed to be the hardest and heaviest of those grown in South Africa, is recorded amongst my notes as being of a bright yellow, with markings of the darkest of ebony and brightest of pink. It is, indeed, at once a remarkable and beautifully defined wood, the deep yellow of the outer or sap-wood—but which is different to the majority of sap-woods in being almost as hard as the heart-wood—offering such a striking contrast to the black and pink of that towards the centre; indeed, I must confess that I have never before seen so beautifully grained and rich coloured wood. Amulets and other ornaments which require the most beautiful of wood for their manufacture, and on which a great amount of labour is usually bestowed, as well as the much-sought-after Kaffir walking-sticks, clubs, fancy boxes, &c., are usually made from this wood; but being of small size—for the largest we measured was but 15 inches in diameter—it is rarely employed in the making of artistic furniture, or for other uses where large planks are an acquisition. We were told that in the coast forests this tree occurs in some plenty. The bark reminded us much of that of our common Holly.

How durable, even under the most trying circumstances, some of the Cape woods are, was demonstrated in a very practical and common-sense way by the Railway Department, for I noticed no fewer than about a dozen sleepers that had been vying from the Cape Government railways for periods varying from three to twenty-one years, and from the effects of which they seemed but little the worse. The red assegi wood certainly seems after nineteen years wear and tear to be as sound as some of the logs cut but recently for exhibition purposes.

Oak and Camphor wood sleepers, after twenty and twenty-one years use, were, likewise, fresh and with but little decay; while those made from Stink-wood also showed clearly how well adapted for that important purpose was the timber of that valuable tree, I fancy, somehow, but only in judging from the specimens exhibited, that the wood of the Oak, Willow, and *Pinus Pinaster*, as grown in South Africa, is superior to what is produced in this country. For certain the wood of the Pine just mentioned, as any

one would see who examined the cross section exhibited, is of a far deeper colour, harder, and with the concentric rings more firmly packed than any I have ever had the opportunity of examining in this country. This Pine is said to grow extremely well at the Cape, but the wood has not been much used yet, unless, indeed, for firewood, for which purpose it is largely used, and sells well at Cape Town. *Pinus Pinea*, of which a nice plank was exhibited, would seem to be more useful than the *Pinaster*, for it is frequently converted into planking for fencing materials, particularly posts, and in the construction of buildings. It is, perhaps, unnecessary for me to repeat what has been frequently stated in the columns of the *Gardeners' Chronicle*, that both these Pines are admirably suited for planting in this country.

The Stink-wood or Laurel-wood (*Oreodaphne bullata*) could not but attract the visitor's attention, whether by the large planks and round sections exhibited, or by the beautiful and costly bedroom and dining-room suites that, from the number of examiners, would seem to have attracted a more than ordinary amount of notice. Resembling the best-marked Walnut-wood, that of the Stink-wood is much prized for furniture making, having little or no sap-wood, being remarkably strong and durable, and susceptible of the very highest polish. Being now extremely scarce, the wood is much valued, but at one time it was fairly abundant and largely used in the construction of carts and waggon, for house building, and, as before stated, by Government for railway purposes.

From the Government Forest Department of Cape Town came some exhibits of the wood of that beautiful tree, *Leucadendron argenteum*, or the Silver tree, leaves and fruit of which were recently figured in the *Gardeners' Chronicle*, but which, from its soft nature, is not much in request, except occasionally for furniture making. It takes a fine polish, and seemed from its pretty appearance to merit a greater amount of attention than we were led to believe is bestowed upon it.

WIDDINGTONIA JUNIPEROIDES.

Two planks and round sections of the commonly called Cedar tree, show off to perfection the nicely marked wood of this valuable, but now almost extinct Conifer. It inhabits the highest parts of the mountains, but has in reality been, as it were, driven there before the axe of the woodman, yet so valuable has the timber of this tree become, that it is now, we are told, conveyed for many miles through almost inaccessible tracts of rocky country, and chiefly by manual labour, to the lower levels, where it finds a ready market.

Government has, however, and not before it was time, come to the rescue of this valuable tree, for whole woods of it have been formed on Table Mountain, but principally at high elevations; so it is to be hoped that both in the interests of commerce and for the beneficial effects to the surrounding country, they may prosper and become a source of revenue to the country.

SNEEZEWOOD (PTEROXYLON UTILE).

Of which we noticed a large-sized board and several sections, is reckoned amongst the most valuable of the South African woods. It is said to be, so far as durability is concerned, superior even to *Lignum vite*, and has actually, in machine bearings, been known to last longer than either brass or iron. Another valuable quality—valuable, at least, in its native land—is its freedom from the attacks of ants on the land, and marine insects when employed as piles beneath water.

CAPE BOXWOOD.

This Boxwood, so far as we could judge from the beautifully polished boards as well as rough logs and sections, resembles very closely our native plant, *Buxus sempervirens*; but with this it is certainly not identical, as any person may at once judge from the carefully preserved specimens of both foliage and fruit included in the interesting, and well arranged herbarium. In colour it is, likewise, lighter than what we have cut up at Penrhyn, but as regards weight and hardness, it is certainly a counterpart of our own. Being very plentiful in particular districts, this tree is sure to find a ready market in Britain, for the Continental supplies on which we have long depended are now said to be becoming less and less.

The many uses to which Boxwood is put in this country, such as in the making of mathematical instruments, and for engraving purposes, render a supply of the wood of the greatest importance, but grave doubts have been, for the past few years, expressed regarding the ultimate supply, which at the present time is gradually on the wane.

YELLOW-WOOD.

Perhaps the largest growing tree in the Cape Colony is the Yellow-wood (*Podocarpus elongatus*), but whether or not certainly the largest plants exhibited in that court were from this tree. The plank referred to was 20 feet long and about 5 feet in width, and showed the pretty yellow colour and unusual freedom from knots and shakes that is not characteristic of large growing woods generally. As will be seen on examining some of the Cape carts and waggons Yellow-wood is largely used for naves, but particularly for the bottoms and framework of the stronger waggons or such as are used for conveying merchandise, &c., from one station to another.

Several Yellow-wood sleepers, sent by the Railway Department, show the effects of both creosoting and an application of chloride of zinc, both of which processes considerably lengthen the lasting properties of the timber. In Africa, as well as here, it has been found by actual experiments that improper seasoning as well as felling these trees at the wrong time impair in a very marked degree the lasting qualities of the wood. *A. D. Webster.*

(To be continued.)

TREES AND SHRUBS.

POISON OAK AND POISON IVY.

THERE seems to be a little confusion about the synonyms of the plants called by these names. Two or three years ago Mr. Archer Hind, who lives in Devonshire, sent me in autumn some very brilliant scarlet and yellow leaves. My son, who had spent two years in the back settlements of Minnesota, and was near when I had opened the box, exclaimed "Hallo! Mind how you touch those; they are poison Ivy leaves." He informed me that two distinct kinds, known as poison Oak and poison Ivy, are common in Minnesota. Their touch, or even their exhalations, affect different persons very differently. He was never injured by them, but he knew a man and his wife who nearly lost their lives by sleeping under one. The poison Oak is a shrub, the poison Ivy a creeper, and the latter is considered the more dangerous of the two. The two are no doubt identical with two species of *Rhus*, or *Sunach*, described by Asa Gray in his *Manual of North American Botany*, p. 111.—1. *Rhus venenata* (De Candolle).—Poison Sunach or Dogwood, the *R. vernix* of Linnæus. A shrub 6 to 18 feet high, also called poison Elder. 2. *R. toxicodendron* (Linnæus).—Poison Ivy or poison Oak. A creeper, climbing over rocks or ascending trees; leaves cut-lobed or else entire, then it is *R. radicans* of Linnæus. Twice this autumn I have seen leaves of this exposed for sale in Covent Garden Market. Mr. Archer Hind tells me that neither he nor any one else have ever suffered any bad effects by touching the plant. *C. Wolley Dod, Edge Hall, Nov. 11.*

A MEMORIAL TREE.

A very interesting reminiscence of the memorable International of 1866 may be seen at the present time in the Ealing nursery of Messrs. Charles Lee & Son, in the shape of a magnificent specimen of *Wellingtonia gigantea*, at the entrance to the fine avenue of mixed shrubs. It is now 35 feet in height, and 20 feet across the branches at the base, well shaped. It was planted by Mr. George Cannon, the manager, soon after the close of the exhibition, its height then being 6 feet. The shrub formed part of a collection of Conifers exhibited by the firm, including *Piceas*, *Araucarias*, *Cedrus*, *Deodara*, &c. They were all planted in front of the nursery as specimens. Although the weather at the time of planting was very hot and dry, and of course very late for such an operation, they all grew ad did well, making nice trees. *Abies Pinnapo* made a grand tree, as also did one or two of the *Cedars* and *Araucarias*. All went well with the trees till the disastrous wet summer of 1879, and the severe winters of 1880-81, which destroyed some and damaged others. The *Wellingtonia* has borne well the brunt of the trying

ordeal through which it has passed, much better indeed than some of its companions at the great horticultural gathering above referred to. The memorable snowstorm on January 18, 1881, thinned the branches a little on the north side, otherwise it would have been a perfect specimen. *B.*

LARGE TREES IN THE WESTERN HIGHLANDS OF SCOTLAND.

Having had occasion lately to visit Ardgarten, the beautiful estate of Donald Macgregor, Esq., which is situated at the south end of the Vale of Glencoe, and the north shore of Loch Long, Argyleshire, a district well known to tourists, here I found in the park, in front, also east and west of the mansion, some remarkably fine trees and shrubs of large dimensions, several of which I measured.

To give your readers some idea of what size trees and shrubs attain to in Northern Britain—the general idea being that few species grow to any great size in the Highlands of Scotland—the following are the measurements and names of the finest, the circumference taken at 1 foot from the ground:—

Spanish Chestnut	31 ft. 6 in.
Ash	11 .. 2 ..
Plane	18 .. 2 ..
Beech	16 .. 10 ..
Oak	17 .. 10 ..
Plane	10 .. 10 ..

Four Portugal Laurels average 12 feet high, and 65 feet in circumference. Three Sweet Bays average 18 feet high by 58 feet in circumference.

I may mention that these are all of them single specimens, standing on the turf. There are also numerous Larches of very large dimensions, and quite free from the Larch disease, the girth of which I did not measure. I hope to have something more to write about this fine place and its surroundings, when the numerous improvements, planting, &c., that are going on at present, are finished. *John Downie.*

P.S. Since writing the above, I have ascertained that the Spanish Chestnut tree noted therein is mentioned in the Life of the late Sir Robert Christison, in the following terms:—

"On August 6, 1877, I visited a Spanish Chestnut tree at Ardgarten, Arrochar, previously well known to me for its magnitude, but not yet so famous as it ought to be. When I was last at Arrochar, in 1867, it was a tall, stately, vigorous tree, 20 feet in girth at 5 feet from the ground, and not to the eye appreciably less for 20 feet upward, where its first division into branches took place. In 1877 it must have been stately, as some of its large upper branches had been blown down; but it was still a most imposing object seen among lesser, but by no means small trees near it. Its base represents a graceful conoid fully 5 feet high, with many buttresses. At the ground root its abutments it measures 31 feet 7 inches; at 1 foot up, 26 feet 6 inches; at 3 feet, where the abutments come nearly to an end, 21 feet 9 inches; at 5 feet, 20 feet 6 inches; and at 6 feet, 20 feet. By Atkinson's hypsometer the topmost twig was seen to be 73 feet high. The central stem appeared to the eye at least 18 inches in diameter about 60 feet from the ground, and had been broken off at about 8 feet higher; so that when I saw the tree in 1867 it must have been about 100 feet in height. No such Chestnut tree has yet been publicly mentioned among the large forest trees of Scotland, so far as I have yet found. Neither have I yet seen any trunk whatever so fine, taking height and girth together."

CERASUS WATERERI.

The planting season of deciduous trees being now at hand I would like to call attention to a tree very effective in ornamental plantations, both in spring and autumn, viz., *Cerasus Watereri*, which carries its foliage longer than most deciduous trees. As at this season, when autumn and winter meet, any bit of colour is valuable, and the only other remaining bits of colour at present are the leaves on the young trees of the common Beech. *Cerasus Watereri* is equally beautiful in bloom in spring with its mauve tinted flowers. *R. Maber, Yaldenham.*

A LARGE TURNIP.—A monster Turnip is at present on view in the shop window of Messrs. Smith & Son, seedsman, Market Street, Aberdeen. This Turnip was grown on the home farm of Kingcausie, from seed supplied by Messrs. Smith & Son. It measures 38 inches in circumference, and weighed 23 lb. when pulled and dressed (about four roots to the hundred weight). The name of the variety is Sixtyton Prize Purple-top Yellow.

Florists' Flowers.

THE CINERARIA.

FOR several weeks we have been enjoying the brilliant colours of the earliest flowering varieties, and those intended to flower later have nearly filled the pots in which they are to flower with roots, while the later April-flowering plants are now being re-potted. The weather, so far, has been admirable, and as a natural consequence the plants are free from green-fly and mildew. A few of the larger leaves have decayed on some of the plants, but not to the extent of causing the least permanent injury. To obtain good specimen plants, the point of the centre shoot has to be pinched out when it has grown 2 or 3 inches. The lateral growths require to be tied out as soon as they are long enough. A strip of tarred twine is tied underneath the rim of the pot, to which they are tied down. The plants require to be looked over about once in two or three weeks to do this, and to remove any leaves that may happen to decay. If green-fly is seen anywhere fumigate at once. Nearly all our plants have been propagated from offsets this year, and are quite as strong as the seedlings. The plants ought to be placed quite close to the glass roof, and those plants that have quite filled their pots with roots are much benefited by being supplied occasionally with very weak liquid manure water.

THE CALCÆOLARIA.

The winter treatment of the herbaceous *Calcæolaria* is very much the same as that of the *Cineraria*. So seldom are the plants raised in any other way except from seeds, that I will but remark that propagated plants can be grown fairly well by taking the growths any time during the summer with a portion of roots attached; these should be potted in sandy soil, using thumb-pots, and as soon as the roots have laid good hold of the soil report them in larger pots, when they can be grown on as seedlings are. Seedlings make the strongest plants and the best furnished specimens; and when the seeds have been saved from the best well marked varieties the probabilities are that distinct good forms will be obtained, and the anticipation of their flowering adds greatly to the pleasure to be derived from watching the growth of healthy good specimens. Green fly does not spread much at this season, and it is best to destroy it by fumigating, as no plants are so liable to its attacks as these. *James Douglas.*

FRUIT REGISTER.

PLUM COE'S LATE RED.

AT the end of the eighteenth century Mr. Jerroise Coe, a market gardener at Bury St. Edmunds, crossed the white Magnam Bonum Plum with the Green Gage, and this cross gave us the delightful dessert Plum known as Coe's Golden Drop—which planted on a north wall it has no equal; but it is to Coe's Late Red that I now wish to call attention. I am sorry not to be able to give its history, so can only say that we have a large tree of it here on the north wall, and that we find it most useful as a very late kitchen kind; it hardly ever misses carrying a good crop, and this season, in common with all other Plums, the crop was simply enormous: but it is its lateness that makes it so valuable, for yesterday was sent in to the dining-room a tart made from this Plum in fresh and good condition. There are several gallons on the tree still: these have suffered more or less from frost, but had there been a glass coping overhead, and "Frigid Domo" been down in front, they would have been good another week or two.

I am aware that it is only second-rate in quality, but then we do not expect such favour late in the season; why I mention anything about it at all is because I do not see it in any nurseryman's catalogue, and it is a pity that the kind should be lost; besides, crossed with some of the new late kinds, we might get something still better. *J. Rust, Eridge Castle, Sussex, Nov. 30.* [The Wydeale is an equally late keeping Plum, remaining good for several weeks after being gathered. It also does well as a standard. Ed.]

PLUM KAISER WILHELM, OR DARK BLUE EGG PLUM.

This is a worthless variety of Plum, very well known in Germany under its latter name. The fruit is $2\frac{3}{4}$ inch in length and 2 inches in breadth, and is of a regular oval shape; the skin thick, tough, and somewhat bitter, but detachable from the flesh; of a black-blue colour, and covered with a light blue bloom. The flesh is golden-yellow, rayed, juicy, and clinging to the stone. In favourable years, as in this one, the flavour is pleasant. *Deutsche Garten Zeitung.*

FORESTRY.

DECEMBER PLANTING.

HAVING in my last communication under this heading treated of the various members of the Pine

Oak had to be sold at 1s. 4d. per foot, and clean straight Ash at 1s. 6d. Not many days ago I had occasion to visit a recently formed plantation at nearly 1000 feet altitude on the Snowdon range of hills, and was agreeably surprised to find that all along the outskirts of the wood in question, and where fully exposed to our hard-hitting south-western blasts, the Sycamore stands boldly out with its best front to the blast, and that even where the Scotch Fir and other equally hardy subjects are forced to give in, as their flattened heads and semi-procumbent habit of growth but too clearly point out. As an ornamental shade-giving tree it is quite superfluous for me to say one word in favour of the Sycamore, for its good qualities have been, both in prose and verse, handed down from the times of our great grandfathers. For hedgerow purposes the Sycamore has few equals, while as a farmer's tree it is found superior to either the Ash or Elm. Let me advise, therefore, every landed proprietor who contemplates planting

ground altitude not too high, the Oak, if only for estate purposes, should be planted in moderate quantity, as local demand will always assist in getting rid of surplus Oak. In the making of gates, carts, waggons, &c., Oak timber is invaluable, while in forestry for posts and fencing generally it is much in request. The rearing and management of Oak plantations, although simple enough, is, nevertheless, attended with "extras" over and above what is usually found necessary in the majority of hard woods.

THE BLACK WALNUT (JUGLANS NIGRA), AND THE COMMON WALNUT (J. REGIA)

are valuable forest trees, but receive far less attention than their merits demand. Perhaps this may be accounted for by the quality of soil required to produce good Walnut timber, for anything apart from a good vegetable loam is considered of but little use in the rearing of this valuable timber tree. The fact that the soil and climate generally of

FIG. 138.—VIEW IN MESSRS. PAUL'S GARDEN AT BROXBOURNE. (SEE P. 711.)

family that have been found well suited for our soil and climate, I now purpose noting briefly a few of such hardwood trees as can be confidently recommended for rather extensive use in the formation of young plantations.

SYCAMORE.

Whether looked at from an ornamental or commercial sense, the common Sycamore is, perhaps, the most valuable tree at present cultivated in this country. For planting in exposed, high-lying situations, or within the influence of the sea, it has certainly few equals, while as to the value of timber produced, it realises at present, nearly double that of any other, not even excepting the Oak and Ash. Even in these depressed times when the market is literally glutted with almost unsaleable timber, we have no difficulty in getting 2s. 6d. per foot for Sycamore of fairly good quality and large size, while picked trees of large dimensions realise even a higher price per foot. This very week we disposed of some Sycamore at the above price, while the best quality of

on an extensive scale to use in the composition of his woods a fair amount of Sycamore trees; while for those who have tracts of coast or mountain land to reclaim, no hard wood is better adapted for, or will ultimately bring in so handsome a return, as the tree in question. Good sized plants with plenty of fibrous roots should be looked for and planted at once.

OAK.

"Once upon a time," and that but barely a century ago, the Oak was, whether as regards value of the timber produced or for ornamental purposes, king of the forest; but, alas! though its beauty still remains, its value in a commercial sense has departed with England's "wooden walls." For the best quality of Oak, felled in autumn, and that will square not less than 12 inches, it is now difficult to get 16d. per foot; indeed I saw a consignment of large trees, the timber being of fairly good quality, offered at the low price of 1s. per foot last week, and it could not be sold even for that. Where the soil is of good quality, and the

Britain is well suited for the tree in question, as well as the circumstance that hundreds of pounds are annually spent in the purchase of Walnut timber for the Army Department of this country, should make us look a little to our own interests, and plant more largely than we have hitherto done so important and valuable a timber tree.

Information from some of our seaport towns reveals the extraordinary fact that good Walnut timber rarely sells at a lower price than 5s. per foot, or double that of any other timber produced in this country. The price of young Walnut trees is, however, a serious drawback to the extensive culture of the tree, for when 6s. per dozen is paid for 3 feet high stuff, the owner thinks twice before purchasing what is sufficient for even a quarter acre. Thick planting in the case of the Walnut should, however, be avoided, for if the individual trees are placed at 24 feet apart, it is quite near enough, the intervening spaces being filled up with any other cheap, fast-growing trees, for removal at an early date. By acting thus, the first

cost of the plantation is usually low indeed. *A. D. Webster, Powhys Castle.*

LIBOCEDRUS DECURRENS.

In your issue of November 20 Mr. Webster tells us that *Libocedrus decurrens* or *Thuja gigantea* is the coming timber tree, and grows 3 or 4 feet in the year. Can he be adding to our confusion by giving the name of *Libocedrus decurrens* to that tree which has been known by the names of *Thuja Lobbi*, *T. Craigeana*, *T. gigantea*, *T. Menziesii*? The tree which is now known as *Libocedrus decurrens*, and once was known as *Thuja gigantea*, is surely of a very different habit, of slow close growth, and of a rich green. I can endorse everything he says as applicable to the tree, which is more generally known as *Thuja Lobbi*. It is a pity that the rules of nomenclature do not allow this tree to hand down to posterity the name of one of our greatest collectors. Can any of your readers endorse what he says as to the value of the timber when grown in this country? If it can compare in this respect with the Larch its other good qualities ensure for it a great future. *William Ellis.* [*Thuja gigantea*, the *Lobbi* of gardens, is quite different from the *Libocedrus*. The timber in its native country is highly valued.]

THE LARCH DISEASE.

The essay by Mr. William Clark, of the firm of Messrs. Clark Brothers, nurserymen, Carlisle, to which the 1st prize of the English Arboricultural Society was awarded, has been published in the *Transactions* of that Society. Mr. Clark in the course of his paper points out that the Larch tree sometimes develops and grows with equal fulness and power in soils and situations of almost opposite character, but seems to prefer alluvial earths or deep rich gravelly lands. Yet it is singularly sensitive to the malign influences of certain soils and subsoils, and particularly of some circumstances of situation and culture—a fact which has not been generally studied by planters. The so-called "Larch disease" is generally found on undrained, retentive, stagnant soils of bog or clay, till, and adhesive loam; and it is here, Mr. Clark points out, that Larch of not more than eighteen or twenty-five years of age often exhibit symptoms of decay, and the trees are found by the forester unsound, or even widely rotten at the core. The finest plantations are those on the sides of mountains where the subsoil is of a dry and porous nature. The origin and the cause of the disease, the essayist contends, is attributable to the varied character of the climate in Great Britain. When the early delicate shoots of the Larch are exposed to a spring frost they not only cease to grow for a time, but the resin and turpentine escape, and, congealing on the surface of the bark, at once affect the growth of the tree permanently. The effect of this is that the insects, attracted by the sweet and scented liquid, immediately feed upon it, causing the matter to be spread more fully over the thin and tender bark. The action of the sun beating upon it then congeals the exudation into a casing as hard as stone, effectually closing all the pores. Hence the excrescences and canker appearances all over the tree, causing ultimately an untimely death. The character and position of the land have a great deal to do with this. Dry subsoil and elevated position early mature the wood, and correspondingly retard the growth in early spring. The early ripening of the wood saves the tree from autumn frosts, and similarly the retarding of early growth, owing to exposed situation, prevents the damaging effect of early spring frosts. The effect of stagnant soil is just the reverse, because the wood ripens badly and late in the season, and so is unfitted to withstand any degree of frosty weather. Then frost acts more powerfully when moisture exists in excess either in the soil or the wood. Mr. Clark disputes the correctness of the theories advanced, that the cause of the disease arises from acid subsoil, microscopic fungi, or the Larch-blight bug, the fungi being a result from causes, and the bug an after cause.

Cold winds, he says, are only a minor factor in the case, and bad management has certainly a little to do with the present position of the Larch plantations of this country. Planters, Mr. Clark advises, should associate the Larch with some other protecting tree, as the Scotch Fir and the Norway Spruce, as their evergreen and bushy character ameliorate the climate very much around them. He recommends thinning out sparingly at first, but regularly, which would allow the maximum of light and air to reach every tree, and so ensure the ripening of the wood and the healthy condition of the trees.

The Apiary.

HINTS ON MOVING BEES.

The season for outdoor work in the apiary is at an end, except indeed we want to move our bees, but I think that had better not be done just yet. It is far better to wait till December at the very least. Mr. Root of Ohio gives a very vivid description of how he lost a strong and valuable stock of bees because he moved them too soon. It is getting cold now, and it would not much matter if that continued. But in this changeable climate we are never safe for a single day, and if the bees are moved on a cold day and then two or three warm days come they would come out as usual, not knowing their position had been altered, and never find their way home again. This would so much reduce a stock that the first spell of cold weather would cause the remainder to die. But though nothing can be done of much account out-of-doors, a great deal can be done for our bees indoors, by looking well to our appliances.

FEEDERS.

Of course no feeders are now on the hives, so we can be looking to them to see if any alteration is required in them, or to get other sorts. There is a very good feeder which is not so widely known as it ought to be. It is manufactured and sold by Mr. Edward J. Butt, a seedsman of Darnestaple, who also invented it. It is about the same shape and size as the round tin feeders sold by Messrs. George Neighbour & Son, but has this advantage, that, being made of white crockery-ware, it can be made as clean and sweet as a china teacup. There is a hole in the bottom of the feeder, and a pipe is fitted in this hole. The bees ascend the pipe, and are prevented from slipping backwards into the hive, and forwards into the syrup, because the pipe is fluted inside and out. A round cap with a glass top stands on the floor of the feeder, and there are two or three small triangular notches at the bottom of the cap, too small for a bee to get through. The vessel is placed in position, and filled with syrup. On the principle of liquids finding their own level, the syrup can never be higher inside the cap than it is outside, so there can be no fear of an overflow, and of course no fear of drowning. The bees can be seen feeding through the glass, and as their standing-room is limited, they are not liable to feed too quickly. Besides, it is always an easy matter to regulate their food by not putting too much in the feeder, as bees must be treated somewhat in the same way as babies. There is a lid with a knob to cover all up, so that no heat is wasted. Everything is made of the best material except the piece of glass. I have called attention to the feeder, as your readers will find it worthy of their attention. *Walter Chetty, Pevensey.*

The Flower Garden.

PLANTING AND PROTECTING.

PROCEED with the planting and removal of all kinds of deciduous shrubs and ornamental trees when the weather is favourable, but defer the operation if the weather be frosty or wet. Evergreens may also be removed when it can be done with a large ball of earth attached, otherwise wait till April. Protection should now be given to Hollyhocks. If the situation be damp and the soil heavy, it will be better to lift all the good sorts and pot them, placing them under shelter of a cold frame if possible, but if the situation be very favourable they may remain in the ground, nevertheless they will be greatly benefited by a little protection from a heap of dry leaves placed around the collar, a few twigs being stuck round to prevent the leaves blowing about. Lilies, Watsonias, *Alstromerias*, &c., should be similarly treated. Some bulbs should now be placed over beds of bulbs in readiness for a mat or other material, in case of heavy rains. Where the subsoil is gravelly, and the material in which bulbs are planted is light, any rain which falls on the beds will pass away speedily, and no protection will be necessary.

ALPINE AND HARDY PLANTS.

Constant attention will now be necessary where alpine plants are grown in pots to see that none of them suffer from too much moisture or from decay of the foliage. On the first symptoms the plants should be attended to, or else loss will speedily follow. Look over Pinks and Carnations under glass to see they do not become dry at the root, for if once they get thoroughly dried up they will not do any good. Remove any withered foliage, so that damp may cause no decay, should it be necessary to shut up the structures close for any length of time. Auriculas require special care at this season. It should be borne in mind that they are perfectly hardy, and that the hardest frost will not kill them, but a close moist atmosphere in their dormant state will speedily do so. See that the plants are never wet, nor over-dry; frequently stir the surface of the pots to admit air to the roots. Scrub the pots upon the first appearance of moss on the surface; this had better be done with a cloth and dry sand, in preference to using water at this season.

ROSES.

It is a too common practice, when Roses are received from the grower, to lay them in by the heel, until such time as they can be planted. They usually under this method sustain much injury, as they commence to push out fresh roots almost at once, the majority of which are destroyed in the operation of final planting. The Rose beds should be prepared before the order is despatched, and immediately the plants arrive, if the weather be open, they should be placed in the quarters they are intended to occupy. Stake and tie up standards as they are placed in the ground. Any delicate sorts will receive great benefit from a hay-banded wrapped round the stem, where the union with the stock takes place. *W. M. Baillie, Luton Hoop Gardens.*

THE ORCHID HOUSES.

CATTLEYAS.

PLANTS of *Cattleya Warneri* now starting to grow should be attended to if potting or top-dressing be necessary, and being a winter grower, like *Lælia purpurata*, it should have the warmest place in the Cattleya-house; the centre stage is good for both. The autumn-flowering *Cattleya labiata* should be examined after the bloom is over. See that the stems from which the flowers are cut dry up properly, or sometimes the moisture will cause the leaf to rot. If this should happen, the decayed part must be cut clean away before decay spreads downwards into the rhizome, as this course often proves fatal to the plants. It is not always safe to pinch the buds from weak Cattleyas with the idea of strengthening the plants; first let the flowers open, as by so doing moisture is taken away from the plants. Our practice before cutting *Lælias* or *Cattleyas* is to open the sheath, and tear it clean out; then cut the flower-stalk close to the leaf, this prevents water from lodging in the sheath. If there is one side of the Cattleya-house that catches more sunshine than the other, it will improve the flowers of *Cattleya Trianae* and *C. Percivaliana* as they open, if placed on this side. If well-developed flowers are expected in this house, care should be taken not to starve the plants by keeping the atmosphere too dry. When it has been necessary to use much fire-heat during the night, the floors should be well damped in the morning, at the same time opening the bottom ventilators a little as soon as the temperature arises.

We keep the evaporating-troughs filled in this house almost all winter, and these are what are termed trough-pipes, which give off a great deal more vapour than cast-iron portable troughs that lay on the pipes. The latter I consider will do little harm in any Orchid-house. In houses that are short of hot-water pipes it would be best perhaps not to fill the troughs in winter, it being necessary to heat the pipes more for the purpose of keeping up a given temperature. The water in the troughs would in such case evaporate too fast, and cause moisture to condense on the foliage. Here, the plants on the side stages stand on inverted pots placed in saucers filled with water, or stands made specially. In houses which have no tanks under the pipes, the dry places should have a thorough drenching with water occasionally during the winter. This should be done in the early morning of bright days.

Where *Dendrobium* flowers are wanted early for

cutting, D. noble, D. Wardiaum, and D. crassinode might be selected, many of which species will now be showing their flower-buds. It is not always best to take them from a cool-house and place them in the warmest, as some of the buds might turn yellow and drop off; but it is better to place them for a week in any intermediate temperature, after which place them in the lightest part of the East Indian-house. I think the Dendrobium, mentioned flower best if kept in a rather dry house with the temperature from 55° to 60°, until about February, when they usually will make a fine display. This gives time for more of the back nodes to develop flowers. *Phaioslossum Rozellii* grown in the East Indian house are now best placed in a lower temperature to flower, as the flowers open there much larger; a warm moist corner of the Cattleya-house will suit them. *Cypripediums* in the warmest house that have filled their pots with roots and are growing freely can be shifted on into larger pots without disturbing the roots; give them less water for a time. Any Orchids that are suspended very near the roof glass should be lowered, as they might get injured during snow-storms or severe frosts. *C. Wolford, Devonisle, Leatherhead.*

PLANTS AND THEIR CULTURE.

THE FORCING HOUSE.

In order to keep up a sufficient supply of flowering plants utilise every available space in this department, selecting the earliest variety of any plant, and those with the best ripened wood. Indian Azaleas, *Andromeda floribunda*, *Kalmia latifolia*, *S. Adamson's Sal*, *Dielytra spectabilis*, *Hydrangea paniculata*, *Staphylea colchica*, *Deutzia gracilis*, *Lily of the Valley* (crowns), Roman Hyacinths, Spices, and *Tazetta Narcissus* can be put into heat. If blue flowers are in request, *Chionodoxa Lucilike*, *C. sardensis*, and *Scilla sibirica*, with a good supply of Violets, will be much liked. The first potted large named kinds of Hyacinths should be examined. If the pots are well filled with roots, and have pushed a little top-growth a few may now be introduced into heat, but they should be taken out of the ashes and a small pot or some moss placed over each crown for a few days previously, to prevent injury from the sudden transition from darkness to light. From this date onward, where space is at command, the Mushroom house is one of the best places in which to bring forward some kinds of deciduous, or therbaecous plants. If a bed of fermenting material be made up and the pots plunged in it, this helps root-action. Lilacs can now be introduced freely into this place, selecting those that have been forced the year before and have good prominent buds, as when once forced they acquire the habit of flowering early. I force the plants in a pit with a tiled and cemented roof and having a flow and return pipe, with a bed of fermenting material. In this place there are no duties in keeping up a supply during twelve months in the year. A few of the early Iris, which are always charming, may be started.

FERNERY.

This should now be kept at a temperature sufficiently low to rest the plants, at the same time it must not be so low, or so dry, as to cause the occupants to get into an unhealthy state. In most ferneries as a rule, about this time there are large quantities of young seedlings self-sown from plants standing about; these should be potted up in a mixture of three parts of fine peat, one of sandstone, and a sprinkling of sand, using small pots. Where decorative Ferns are grown in pits, and the floor is moist (as it should always be), of such varieties as *Adiantum gracillimum*, *A. cucullatum*, and *A. concinnum*, &c., there is no need to sow Fern spores, there always being enough and to spare found in such places; but if any sort is scarce, spores should be sown in pans, using a mixture as for potting, pressing, and watering before sowing, otherwise the seed gets washed out, or too deep. The spores should always be gathered as soon as there is any sign of being liberated from their capsules, and they soon drop. *E. Evans, Lythe Hill.*

FRUITS UNDER GLASS.

PINES.

PLANTS of the Smooth-leaved Cayenne, Charlotte Rothschild, and Black Jamaica, which are swelling their fruits, should have a minimum temperature of 70°, running it up 15° or 20° with sun-heat at closing time, about 1 o'clock in the afternoon, damping slightly at the same time the walls, pathway, and plunging material, with warm water, care being taken

not to let any water into the "crowns" in doing so, as that would cause them to become unduly large. Give sufficient tepid liquid manure at the roots when necessary, to thoroughly moisten the whole ball of earth. Keep the evaporating troughs on the hot-water pipes filled with warm-water, and in order to keep the fruits swelling steadily until the ripening stage is attained a bottom heat from 85° to 95° should be maintained, and where there is any difficulty experienced in keeping up that degree of heat it will be advisable—as indeed it will, should the necessity for doing so, not arise—to cover the same with mats or any other protecting material that may commend itself for that purpose, as by so doing a more genial heat is secured.

SUCCESSION PLANTS.

Plants in every stage of growth should, except those of the Smooth leaved Cayenne, which at all times require more moisture at the roots than other varieties be still kept on the dry side at the roots. I do not, however, mean by this that the plants of Cayenne are to be kept very moist at the roots, but that they should be kept only moderately moist; and aim at a night temperature of from 60°—55°, according to the weather, 5° higher by day with fire-heat, admitting a little fresh air when the thermometer reaches 65°, and afterwards regulating the ventilators according to the rise and fall of the temperature outside, giving abundance of air after the thermometer has registered 75° on bright days, so as to maintain the plants in a good sturdy condition. In many places the old-fashioned pigeon-holed Pine pits are still in use, and in which case the bottom-heat, which for the plant under notice should not be much under 80°, will be supplied by a bed of Oak and Chestnut leaves. The heat must be maintained both at top and bottom by adding fresh materials to the linings, and thus in the absence of severe frost no recourse need be had to the hot-water apparatus. *H. W. Ward, Longford Castle.*

HARDY FRUIT GARDEN.

If it had not been for the unusual heavy rainfall experienced during last month, the almost total absence of frost would have rendered it a splendid planting month. Nevertheless with the aid of a little dry soil placed just about the roots we have been enabled to plant many small trees, principally maidens and cypresses. Should the weather remain mild, as at present, planting may well be continued a little later than is advisable during seasons when frost comes upon us at earlier dates, and the temperature of the soil so rapidly descends, and its texture makes it unfit to be pressed around the roots. As fast as the nailing and pruning of a row of wall trees are accomplished, the border lying immediately over the roots should be forked up to the depth of 3 or 4 inches, and the soil left in a rough state, as the roots of established trees never get too much moisture when growing in such situations; in fact, the soil is frequently found to be dry there, even after long intervals of rainy weather. In many instances this is owing to the continual treading occasioned by attending to the trees themselves and when cultivating for, and cutting vegetable crops. It is a capital plan to have a line of rough, stout boards to put down along the alleys, on which to walk at all seasons.

LICHENS ON TREES.

Any established trees on walls, where the old leading branches are inclined to get green and covered with moss, lichens, or other bark-injuring parasites, should not be allowed to pass over another season without being dressed. Various solutions from time to time have been recommended for the destruction of these, but as yet we have found nothing better than a mixture made as follows, applied in the form of an adhesive paint. The foundation of the paint should be stiff clay, add to this soot, lime, and sulphur, mixing the whole well together until it is just of the right thickness to work easily on the branches. A mixture of this kind will not only destroy it at once, but prevent its infliction again for several years, and when put on with a brush, it can be kept off the young wood—a difficulty not easily overcome when applying a solution with the syringe of a garden engine. For large bush-shaped or standard trees, with lichens on their branches, we use finely sifted slaked lime; a dressing every two or three years will keep them clean. It

should be dusted on when the branches are damp, or the trees can be syringed before applying it. Trees growing in low lying places, naturally damp, are certain, sooner or later, to get covered with lichens, if some preventative be not applied, and the bearing wood gradually becomes smaller as the pest gets established on the branches. It is caused more by a damp atmosphere and where heavy fogs are prevalent at nights, than by any ill effects arising from a bad condition at the roots. It is undoubtedly a troublesome evil, and in districts where it grows more or less on all forest trees the position selected for planting fruiting subjects should be as high as possible, providing other circumstances are favourable. Fig trees should now have protection placed round the branches in the shape of mats or straw bands, and in cold districts, where very severe frosts occur, Apricot trees might be similarly protected with great advantage during hard weather, but it is essential that it should be removed as soon as milder weather sets in.

THE FRUIT-ROOM.

The fruit in the fruit-room should receive attention once a week in the way of removing decayed fruit. Many of the varieties are ripening up earlier than usual this season, and notes should be made of their keeping qualities, which will be most valuable when making further plantings. For the sake of variety a limited number coming into use at each season ought to be grown, as if one variety fails the other might carry a crop, and so no break in the continual supply would occur. *G. H. Richards, Somerley, Kingswood.*

The Kitchen Garden.

WINTER SPINACH.

OWING to the mildness of the season, this crop has in a great many instances advanced too rapidly, and shows signs of running to seed; where this is found to be the case, the plants should be looked over, and the centres of all those so showing pinched out, also removing at the same time all decayed withered leaves and weeds.

YOUNG CAULIFLOWER AND CABBAGE.

The same remark also applies to these that were pricked out into frames, &c., to stand the winter; in the warm, mild weather having encouraged them to grow so rapidly and luxuriantly, there is the probability of their buttoning prematurely and so becoming useless for the purpose for which they were intended. To guard against disappointment and failure, it would be advisable to make provision, by potting up plants from the latest sowings of Early London Cauliflower into 3-inch pots, placing them in a cold close frame until rooted, after which plenty of air should be given to render them robust and hardy. Cabbage plants from the seed beds also, should be pricked out on to others, thereby giving them a beneficial check, and preventing them from becoming drawn and weakly. Those planted out on permanent quarters should be hoed and earthed-up as they advance, and all yellow withered leaves removed, making good any failures.

LETTUCE AND ENDIVE

in frames will require constant attention, removing any decayed leaves, and occasionally stirring the surface of the soil between the plants, giving all the air possible. Cos Lettuce should have a strip of matting passed round them a week or ten days before they are required for use. Endive, to be thoroughly white, tender, and free from bitterness, should be allowed quite three weeks for bleaching, and before being covered or tied up must be as dry as possible, otherwise they are liable to rot during the process. Frames being cleared can be refilled with plants from outside, or the plants be thinned out and transplanted from store frames.

RADISHES, WOOD'S EARLY FRAME.

These can be sown on a light bedded in from 6 to 8 inches of fine light soil, the seeds lightly covered, and little if any air admitted until the seeds germinate.

CHICORY.

Roots sufficient to meet the demands should be placed in the Mushroom-house, selecting the darkest corner. *J. Austen, Willey Court.*

Appointments for the Ensuing Week.

SHOWS, &c.

TUESDAY, DEC. 7.	Royal Horticultural Society: Meetings of the Scientific, Fruit and Floral Committees, at South Kensington. Meeting of the National Chrysanthemum Society at the Royal Aquarium, Westminster. National Rose Society: Annual Meeting at 1, Henrietta Street, Covent Garden, W.C., at 5 P.M.
WEDNESDAY, DEC. 8.	
THURSDAY, DEC. 9.	
FRIDAY, DEC. 10.	

SALES.

MONDAY, DEC. 6.	Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs and 5000 <i>Lilium auratum</i> , at Protheroe & Morris' Rooms. Sale of Roses, Fruit Trees, Shrubs, Border Plants, Dutch Bulbs, &c., at Stevens' Rooms. Sale of 5000 <i>Lilium auratum</i> , Plants, Roses, &c., at Protheroe & Morris' Rooms. Sale of Imported Orchids, and 10,000 <i>Lilium auratum</i> , at Stevens' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of a large Importation of <i>Cattleya Lawrenceana</i> , at Protheroe & Morris' Rooms. Sale of Roses, Fruit Trees, Shrubs, Border Plants, Dutch Bulbs, &c., at Stevens' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY, DEC. 8.	
THURSDAY, DEC. 9.	
FRIDAY, DEC. 10.	
SATURDAY, DEC. 11.	
SATURDAY, DEC. 11.	
SATURDAY, DEC. 11.	

The Potato
—Tercentenary
Celebration.

The collection in the building euphemistically called St. Stephen's Hall, is decidedly interesting. As to the exhibition of the noble tubers that does not present much novelty or any special interest. It is spoken of in another column, so that here we need no more than make passing reference to it. The chief interest undoubtedly lies in the extensive and varied collection of books, maps, and engravings relating to the naval heroes of QUEEN ELIZABETH'S time, such as the RALEIGHS, DRAKES, HAWKINS, in the course of whose wanderings, and perhaps from the pillage of Spanish ships, the "Papas Peruanorum" was introduced into Europe. Side by side with these are the works of CLUSIUS, GERARD, BESLER, and other botanists of the sixteenth and seventeenth centuries; while Mr. BAKER'S coloured drawings aptly illustrate the botany of the Potato in this present year of grace, and Mr. SMITH'S diagrams illustrate the diseases to which it is heir. The history of the introduction of the Potato, it will be remembered, was discussed at great length in our columns in the spring by Mr. W. S. MITCHELL.

Possibly, one result of the conference may be to clear up some of the points still left doubtful, and almost certainly another result will be to add to our existing knowledge on the subject. Mr. CLEMENTS MARKHAM, for instance, shows some books and reprints of manuscripts not known to botanists, still less to Potato cultivators, and which are of great interest as showing how extended was the cultivation of the Potato by the native Peruvians and Chilians anterior to the Spanish conquest—how long anterior it is impossible to say, but it must have been for many centuries. One of these books, by GARCILASSO, contains an account of Potato cultivation by the Incas, and another includes a vocabulary of names in the now extinct Chibcha language. The Spanish priests and others collected vocabularies of native words, some of which have been reprinted in our own times. One such work—the *Gramatica, Vocabulario . . . de la Lengua Chibcha*, por Don E. URICOECHA—contains nine or ten names applied to different varieties of Potatos, such as *Papa turma de tierra*, *amarilla*, *ancha*, *arenosa*, *blanca*, *grande*, *larga*, *menudilla*, *negra*, and *negra por dentro* (black inside).

These names prove that there were varieties then as now, differing in flavour, size, colour, and in the character of the soil in which they grew. The Chibcha language was spoken around Bogota.

Another book (referred to but not exhibited) is a dictionary of the Aymara language in Southern Peru, compiled by BERTONIO. In this work we are told that no fewer than eleven varieties are mentioned. These facts are of great interest intrinsically, and they serve to explain the difficulty experienced in ascertaining beyond dispute what was the real starting point of the Potato as we now know it. Some interesting relics of RALEIGH are shown, together with photographs of his house at Youghal, Cork, now the residence of Sir JOHN POPE HENNESSY. "My Oriol" as RALEIGH mentions in his letters to Queen BESS, is still in existence, and the identical spot is photographically represented where tradition alleges that RALEIGH grew his first crop. Be that as it may, it is interesting to see Potatos grown from the same garden in this present year of grace, with a spray of the Yew under which he may have sat, and to note the primitive looking tools still in use by the Irish peasants—tools which, in form, carry us back to the Bronze Age.

The question as to the exact species, variety, or form experimented upon by Messrs. SUTTON at Reading, will no doubt come under consideration. The substance of Messrs. SUTTON'S statement has been given in a previous issue, and in support of their allegation that a mistake has occurred they adduce Lord CATHCART'S evidence, which is before us as we write, and what is more to the point, they rely on their own personal observations at Kew, and on the remarkable experiments with cuttings as shown recently by them to a party of experts. That a mistake has occurred somewhere, it seems impossible to doubt, but it is not clear exactly where it occurred. Messrs. SUTTON'S evidence seems to us quite conclusive on this point. Mr. BAKER, on his part, energetically protests against the notion that any mistake was made by him; so the matter may well be allowed to rest.

Another season, Messrs. SUTTON can repeat their experiments with true *Magia*, free from any possible doubt. The interests of individuals or establishments are, after all, only incidentally involved. It is the interests of science that are paramount, and through them those of practical utility. The reputation of Mr. BAKER as a botanist is beyond serious criticism, though he, as a man of science, would be one of the very last to claim anything like infallibility, and Messrs. SUTTON can perfectly well defend their own well earned reputation.

— EUPHORBIA GRANDIDENS.—The Succulent house at Kew serves to give some idea of the appearance of the giant Euphorbias, Cacti, and Agaves, but excellent and interesting beyond measure as is that collection, when the circumstances of the case are considered, it is clear that it must be only suggestive. What house could contain such a specimen as that we now figure (fig. 139), from the estate of Mr. RANDLE, of Sydenham, Durban, Natal, where the plant is growing under the care of the gardener, Mr. CLAPHAM? The figures of the Caffirs in the foreground convey some idea of the magnitude of this Spurge—an impression that will be intensified by the inspection of the natives in the branches. The spread of the branches, indeed, as we learn from Mr. ADLAM, is no less than 35 yards, and the girth of the tree about 12 feet.

— HORTICULTURAL AND AGRICULTURAL EXHIBITION AT TRONDHEIM, 1887.—The eighth general exhibition of the productions mainly of Sweden, Norway, Denmark, and Finland, will take place on July 4, and last till the 10th of the same month. Delegates from foreign countries requiring lodgings must state their requirements to the "Landbrugsmædte Indkvarteringskøtor," in Trondheim, Norway. The programme is very comprehensive, and the show should be well deserving of a visit.

— FRAU THERESA KOCH.—We regret to hear of the decease, after long suffering, of the widow of

the late Professor KARL KOCH, of Berlin. Frau THERESA KOCH died at Berlin on Nov. 26, in her sixty-ninth year.

— EDWARD SPARY.—A suggestion has been made to us that an attempt should be made to alleviate the distress of EDWARD SPARY, of Brighton. He has fallen into misfortune, but as the boy who, as we are informed, was the first stoker of a horticultural boiler, he deserves practical sympathy from those who have profited by heating by hot water. It is related of him that he saw a shoulder of mutton cooked for a wagger in an ordinary stable pail at a roadside inn near Bath, and from observation of the bubbles rising from the bottom of the pail to the top, the idea was suggested to Sir A. EADY that hot water could be made to circulate in pipes, and SPARY was, as we have said, the stoker. We tell the story as it is told to us, and need not enter into discussion on the matter, the practical point being, who will help SPARY? We have a promise of a small subscription, and if others come forward we will do our best to help the matter on.

— CERTIFICATED POTATOS "KING OF RUSSETS" & "FREEDOM."—We are informed by Mr. LYE that he has disposed of the entire stock of these two high-classed Potatos to Messrs. JAMES CARTER & Co., of 237, 238, High Holborn, W.C., who will, in due course, distribute them.

— LIVE PLANTS FOR THE CONTINENT, AND THE PHYLLOXERA REGULATIONS.—We are pleased to be enabled to publish the following letter on this important subject, from Messrs. PITT & SCOTT, Foreign Carriers, 23, Cannon Street, London, E.C.:—"Your readers who may be forwarding live plants roots to the Continent should, before the same are packed, take care to first comply with the regulations imposed by the respective foreign Governments, which require the sender to make a declaration before a magistrate, to the effect that the plants in question are perfectly free from Phylloxera. The magistrate's signature requires afterwards to be verified by the nearest Consul, or Consular Agent of the country to which the plants are going. We will supply the necessary forms and instructions free on application. We have had many instances of delay and disappointment, through persons sending plants off to us, without first complying with these regulations. These declarations are required for France, Belgium, Holland, Switzerland, and Italy. Live plants are prohibited from importation into Germany from the United Kingdom.

"DECLARATION.

"I, _____, do solemnly and sincerely declare that the (case, bundle, or bag) marked _____ contain as shipped by me for the _____ to _____ (state full particulars of contents), all of which (shrubs, roots, trees, plants, or seeds) are set forth and described in the annexed invoice, marked (_____). And I further declare that the whole of the said (shrubs, roots, trees, plants, or seeds) are perfectly free from the pest known as Phylloxera. And I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of the Statutory Declarations Act, 1835. Subscribed and declared at this day of _____, 188 ____."

— NATIONAL AURICULA SOCIETY.—NATIONAL CARNATION AND PICOTEER SOCIETY.—We are informed by Mr. DOUGLAS, Great Gearys, Ilford, Hon. Secretary, that the annual general meeting of the above Societies will be held, by permission of the Council of the Royal Horticultural Society, in the east crush-room of the Albert Hall, South Kensington, as soon after 12 o'clock as possible, on Tuesday, December 7. The business of the meeting will be—the election of officers and committee; the reception of the Secretary's and Treasurer's reports; the election of judges for the ensuing year, and any other necessary business as may pertain to the annual general meeting.

— DEVELOPMENT OF SILLOTH.—With a view to increase the convenience of the general public, and to induce builders to provide the much-needed further accommodation, the directors of the North British Railway Company have called in the advice of Messrs. LITTLE & BALLANTYNE, the well known Carlisle nurserymen, who have executed a plan for providing shelter and ornament, by breaking up the great stretch of greensward between the parade and the sea by ornamental belts, mounds, rockeries, and clumps of

flowering and evergreen shrubs. A public meeting has been held at Silloth, in order to support the movement of the railway directors, by resolving that a small rate be levied to provide funds for planting all the streets of the town with avenue trees, and thus give them the appearance of Continental boulevards.

Exhibition will not re-open next year the attention of the amusement-loving public will be undividedly directed to the American Exhibition, to be opened May 2, 1887, at Earl's Court, Kensington. The Jubilee year, then, will be made additionally attractive by the enterprise of our Yankee cousins in coming

— ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The annual meeting of this Society was held on Saturday evening, 27th ult. There was a large attendance of members, and Councillor LYON, chairman of the acting directors, presided. The Secretary, Mr. A. M. BYRES, Aberdeen, read the

FIG. 139.—EUPHORBIA GRANDIDENS IN NATAL. (SEE P. 720)

The trees will be planted 30 feet apart, and will line each side of the whole of the streets. They will consist of Sycamores, Norway Maples, Elms, Chestnuts, Limes, &c.

— THE AMERICAN EXHIBITION.—Now that it is definitely settled that the Colonial and Indian

across the ocean to submit for our inspection, criticism, and haply our approval, the results of their last half century of industry. Already a large number of men are at work on the grounds at Earl's Court. Preparations are being pressed forward in every way, and the main building is in process of construction.

directors' report as follows:—"In submitting the annual report for 1886, your directors desire to express the thanks of the Society to Her Majesty the QUEEN for the handsome prize which Her Majesty has been graciously pleased to continue this year. The best thanks of the Society are due to the Right Hon. the Earl of ABERDEEN, Sir WILLIAM CUNLIFFE

BROOKS, Bart., M.P.; Sir FRANCIS GRANT, Bart., of Monymusk; J. H. BOIT, Esq., Sutton Hall, York; the Town Council of Aberdeen, Lord-Provost HENDERSON, ex-Lord-Provost MATTHEWS, and others, for their contributions to the prize list. The total income for the past year amounted to £369 1s. 7d., and the expenditure to £333 17s. 3d., leaving a surplus of £26 4s. 4d. to be deducted from the adverse balance of £41 16s. brought forward from last year, thus reducing it to £15 11s. 8d., which sum the directors are hopeful will be wiped off next year." A letter was read from Sir FRANCIS W. GRANT, Bart., of Monymusk, intimating the presentation of a silver cup, value £5, for the best table of plants for next year's show.

— M. CAMILLE DOGNIN.—All visitors to Cannes have heard of, and many have seen, the gardens of M. DOGNIN at Valletta-Californie. The garden, indeed, formed one of the attractions for plant lovers visiting the French Riviera. We now learn of the death of this eminent horticulturist. Having accumulated a fortune in business in Central France, he settled at Cannes, because, as he said, that was the only country in which he could at his age engage in planting. With this object he selected the district known as California, for even at Cannes the climate varies according to locality, and the spot chosen by M. DOGNIN enjoys perhaps the mildest climate of all. In the garden created by him in a previously sterile region M. DOGNIN collected together illustrations of the vegetation from all countries which would be likely to thrive out-of-doors on the shores of the Mediterranean—Palms, Tree Ferns, Agaves, succulents, and, indeed, plants of all kinds suitable to the climate. Not only were the plants well selected and well cared for, but great pains were taken with their arrangement in picturesque manner. The *Midi* relates how M. LINDEN paid these gardens a visit, and said to the proprietor—"Sir, I shall pay you no compliment nor utter any eulogium—you must have received so many as to be no longer capable of appreciating them; but, I may assert your claim to have collected in your garden, in the open air and in good health, a larger number of plants than can be cultivated elsewhere in Europe without protection." M. DOGNIN thus contributed very largely to the introduction and acclimatization—if that word may be permitted—of plants along that favoured coast. M. DOGNIN'S labours find an eloquent and grateful exponent in M. A. CONSTANT, the President of the Horticultural Society of Cannes.

— NEW EXHIBITION RUNNER BEAN.—What with the Champion Scarlet Runner, the Girtford Giant, the Wiltshire Giant, and Ne Plus Ultra—all fine, long, and large podded types of the Scarlet Runner Bean—there appears to be no lack of exhibition varieties. But a new claimant to public favour comes to us from Holland, known as Vancel's White Princess, a giant long-podded variety without strings, a higher productive and remarkable new variety, with very fleshy and soft pods, 20 inches in length, really without strings, and which are to be eaten with the husk. Here is the Bean of the future! Ne Plus Ultra has to face the advent of one far beyond it in the scale of promise. But what of the performance? We shall see.

— A DOUBLE WHITE PHLOX DRUMMONDI.—This is one of the novelties that Mr. ERNEST BERNARY, of Erfurt, announces for this season. It is the first really double Phlox ever offered to the trade, and it is believed that it will prove the progenitor of a new class of one of the most popular and showy annuals, and in the case of this particular novelty it is not merely a tendency to become double which is apparent, but, on the contrary, more than half of the seedlings, at least, produce a profusion of charming densely double pure white flowers. This Phlox originated in the United States of America, and it is from a personal inspection of its merits while on a visit there that Mr. BERNARY has been induced to offer it.

— THE SURVEYORS' INSTITUTION.—The next meeting will be held on Monday, December 6, when a paper will be read by Mr. E. RYDE (Past-President), entitled "The Title Question, with Suggestions for the Redemption of the Rent-charge," which will be followed by a discussion on the paper, and on the

paper entitled "Extraordinary Title and the Redemption Act of 1885," read by Mr. J. W. WILLIS BUND (Associate), at the meeting of Monday, November 22.

— BOTANIC GARDENS.—From a report of the Montreal Horticultural Society we learn that there are 197 gardens of this character, distributed as follows:—Great Britain and Ireland, 12; British colonies, 27; Germany, 34; France and colonies, 25; Italy, 23; Russia and Siberia, 17; Austro-Hungary, 13; Scandinavia 7; Belgium, Holland and colonies, Spain and colonies, United States, 5 each; Portugal and Switzerland, 3 each; Denmark and Roumania, 2 each; Brazil, Chili, Ecuador, Egypt, Greece, Guatemala, Japan, Peru, Servia, each one—total, 197. The list is not complete, though sufficiently so for the purpose; Geneva, Louvain and some of the Indian gardens are omitted. Of the gardens named about half are maintained by the state—about 18 per cent. by universities, either alone (5 per cent.), or in association with the state or municipality; 11 per cent. are maintained by the municipalities, and 5 by private donations; 94 per cent. grant free admission; 70 per cent. are open on Sundays; and 73 per cent. publish reports or in some way contribute to scientific research. The Montreal garden itself seems to have made a fair start, and as it is capable of doing such good service we earnestly wish it success. Most botanic gardens fail in their duties as regards instruction in horticulture. The science of horticulture should in such an establishment receive as much attention as the science of botany itself. If a botanic garden is to confine itself simply to the cultivation and diffusion of ornamental plants, no doubt the work could be as well done by commercial establishments, but the botanic gardens should be in each district the head centre of applied botany including agriculture, horticulture, pomology, and forestry.

— THE PHILADELPHIA FLORISTS' CLUB.—This club having been hospitably and sumptuously entertained by Mr. G. W. CHILDS, at Wootton, presented the host, in acknowledgment of his kindness, with a magnificent bronzed iron vase, the dimensions of which, according to the *American Florist* are 7 feet 4 inches in height, the bowl being 8 feet in diameter. It is placed on the lawn in front of the house, and is an appropriate and handsome object.

— ACACIA FISTULA.—According to Dr. SCHWEINFURTH, in the *Pharmaceutical Journal*, the Acacia fistula, which grows in dense groves in Nubia, is known among the natives as the "whistling tree." It owes its name to the fact that a gall insect selects for the site of its operations the ivory-white shoots, which the development of the larva distorts and causes to swell at the base into a bladder-like gall, about 1 inch in diameter. The insect upon emerging leaves a circular hole, and the wind playing upon the shoot is said then to produce a flute-like sound.

— NATIONAL CHRYSANTHEMUM SOCIETY.—On November 29 a largely attended meeting of the General Committee took place at the "Old Four Swans," Bishopsgate Street, R. BALLANTINE, Esq., Vice-President, in the chair. The Hon. Secretary having read a list of the extra and special prizes awarded at the recent show at the Royal Aquarium, they were duly approved; among them were the Silver Medal of the Society, to Messrs. G. BUNYARD & CO, Maidstone; and Mr. WILLIAM HOLMES, the Hon. Secretary, for extra exhibits. Communications were read from Mr. E. MAWLEY, recommending some important alterations in the schedule of prizes; from Messrs. WEBB & SONS, seed merchants, Stourbridge, offering to continue their special prizes for six dishes of vegetables at the next annual show, and considerably augmenting the value of their prizes; from Mr. WOOD, of Wood Green; Mr. COLCHESTER, of Ipswich; and Mr. FIELD, of the Old Kent Road, also offering special prizes. These were referred to the Schedule Sub-committee. Twenty-five new members were elected, bringing the numbers up to 399. Several protests against the awards made by the judges at the recent Aquarium show were considered and disposed of. It was announced that a private subscription had been opened and the sum of five guineas had been subscribed to be presented on the occasion of the annual dinner to Mr. C. GIBSON, of Morden Park,

Surrey, in recognition of the splendid stand of forty-eight blooms he exhibited at the Royal Aquarium, which were a long way first in the premier class, but had to be disqualified through an unfortunate oversight. The date of the annual dinner was fixed for Monday, December 13, on which occasion the prize-money will be paid. Subject to the approval of the annual general meeting, the November exhibition in 1887 was fixed for Wednesday, the 9th, and Thursday, the 10th, of that month. The meeting closed with the usual vote of thanks to the Chairman.

— Mr. AYRTON.—The death is announced of this gentleman, best known to readers of this journal for his conduct towards the then Director of Kew, and toward men of science and art generally. *De mortuis nil nisi bonum*. It is sufficient to say that Mr. AYRTON'S motives were laudable, and that his attacks upon Kew and its management really contributed very much indeed to raise the establishment and its staff in public estimation.

— ALLOTMENTS.—As a supplement to the agricultural returns given at p. 683 we give the following:—In other allotment tables we find the number of labourers having ground for Potatoes in June, 1886, is stated to be—in England, 80,015; Wales, 13,263; Scotland, 17,838; making a total for Great Britain of 111,116. It is further returned that in Great Britain there are 134,932 allotments or field gardens (excepting railway allotments) of under one-eighth of an acre; of one-eighth and under a quarter of an acre there are 117,766; and of a quarter and under a half, 105,097. The returns of allotments of from 1 to 4 acres (both inclusive) are divided as follows:—Arable land, 19,071; pasture land, 12,339; partly arable and partly pasture land, 531;—showing a total of 36,722. As for those granted by railway companies to their servants it was found that in June, 1886, in Great Britain there were 33,385 of under one-eighth acre, 4160 of one-eighth and under a quarter of an acre, 1570 of a quarter and under a half, 310 of 1 to 4 acres (both inclusive), making a sum-total of 39,425 (which includes 350 allotments on the London and North-Western line which are held by others; than the company's servants.

— PROPOSED PRESENTATION TO MR. W. HOLMES.—We understand that it has been decided that the presentation of a testimonial to Mr. W. HOLMES, Hon. Sec. of the National Chrysanthemum Society, shall take the form of a silver centrepiece with two side tazzas, for the table. These will be accompanied by an illustrated address. The presentation will probably be made to Mr. HOLMES on the occasion of the Society's annual dinner.

— PUBLICATIONS RECEIVED.—*The Chemist and Druggist*, No. 344. (London: 42, Cannon Street, E.C.)—*The Apple and Pear as Vintage Fruits*. By ROBERT HOGG, LL.D., &c.; H. G. BULL, M.D., &c. (Woolwich: Naturalists' Field Club: JAKKMAN & CARVER, Hereford.)—*The Insurance Year Book*, 1887. (London: SIMPKIN, MARSHALL & CO.)—*The Band of Mercy*, vol. viii.; also *The Animal World, an Advocate of Humanity*, vol. xviii. (London: S. W. PARTRIDGE & CO., 9, Paternoster Row, for the Royal Society for the Prevention of Cruelty to Animals.—*Charity*. (London: WYMAN & SONS, 74, 75, 76, Great Queen Street, W.C.)

— GARDENING APPOINTMENTS.—Mr. LOWRY, late Gardener to JAMES MACANDREW, Esq., Belmont, Mill Hill, has been appointed successor to the late Mr. SARGESON, who was Head Gardener for forty-one years to Sir H. F. DE TRAFFORD, Bart., Trafford Park, Patricroft, Manchester.

— THE HISTORY OF A VIOLET.—The mosque at Adrianople, says a writer in the *Daily News*, has a legend connected with a stone Violet plant which is carved over its fountain. A poor man, who owned part of the ground over which the mosque is built, refused to sell his land unless a Violet, which had been planted by his wife, was allowed to bloom upon it. The Sultan accepted the condition, and the Violet was carefully rilled in and tended, but in time it died, and the sovereign ordered that a fountain should be erected on the spot where it had blossomed, and that a stone Violet should be carved upon it as a symbol of marital constancy.

Notices of Books.

Life Histories of Plants. By Professor D. McAlpine. (Swan, Sonnenschein & Co.)

The first chapter of this volume contains an interesting account of the relationships existing between plants and animals, and between morphology and physiology. The author, while acknowledging that the two departments are naturally inseparable, evidently leans to the physiological side of his subject rather than the morphological. His aim, as he tells us, is to study the plant as a living thing, and not as a dead carcase. This is well; but in his desire to exalt physiology he surely detracts from the importance of morphology by speaking of it merely as "a matter of mechanism," while he mixes up physiology with morphology when he goes on to say that it (morphology) reveals "nothing higher than a combination of mechanical movements, harmonious in action and beautiful in execution." The harmony of action and the beauty of execution are surely matters of physiology.

To speak of morphology merely as a matter of mechanism is to ignore hereditary descent and consanguinity, to set aside progressive variation, adaptation, reversion, or degradation. Morphology is not satisfied with a knowledge of things as they are, but seeks to know them in relation to other things and to their surroundings, and it endeavours to ascertain how things became as and what they are, while it seeks the aid of physiology to know the aim and present purport of morphological appearances. In tracing the several existing groups of plants and animals the author starts with simple protoplasm, from which two main groups were formed, distinguished by their different modes of feeding, and then "the plant having acquired its green colouring matter or chlorophyll, was enabled to live independently upon the inorganic material around it." The Professor does not, nor could he, tell us how the plant first acquired its green matter, and yet from the tone of his language, if not from his very words, it might be inferred by the student that there was no mystery about it. From this beginning the author passes on to the higher groups of plants, distinguishing in each group, or in each organ, such as the root, an elemental rudimentary type, a typical or fully developed condition with modifications by excess or defect, according to circumstances.

In his comparative classification he brings into clear relief the differences in plants according to the number of distinct stages through which they pass—neutral, bud-forming, spore-bearing, or sexual. A study of Professor Cauvel's *Morphologie Végétale* is of great importance from this point of view.

Professor McAlpine's book is well adapted to the requirements of those who desire to get a good general view of plants and of their mode of life; but there is in this, as in most modern botanical books, an absence of systematic method and arrangement, which renders them difficult to consult. A terse diagnosis is no doubt artificial and dogmatic rather than scientific, but it is as useful to a student as an index or a table of contents.

Professor McAlpine's book, moreover, is destitute of any index, and the illustrations are mostly old friends from Sachs or other sources; nevertheless, for the purposes we have indicated, the book is in the main well adapted, and we may commend it for its freshness and modern spirit, which renders it abreast of the times.

Colonial and Indian Exhibition, 1886: Empire of India. Special Catalogue of Exhibits by the Government of India and Private Exhibitors. (London: Clowes & Sons.)

Amongst the last, if not actually the last, to appear of the several handbooks and catalogues of the late Colonial and Indian Exhibition was that referring to the empire of India. Considering the extent of space occupied by the exhibits in the Indian section, and the great variety and extent of those exhibits, it would be natural to expect that the catalogue would be one of considerable bulk, and that this is so proved by the present volume extending to 317 pages. The book, which is full of valuable information of a very varied character, is especially valuable for its "Guide to the Economic and Commercial Court," and for that to the "ethnological models and exhibits

shown in the Imperial Court," both of which have been prepared by Dr. George Watt, the special officer in charge of the Economic Court. Under the first head the several subjects are treated in the following order:—Timbers, fodder and cattle foods, human food in times of scarcity, vegetables, tubers, bulbs, roots and stems, fruits, nuts, condiments and spices, pulses, grains, sugars, starches, and toddy, narcotics and stimulants, drugs, fibres, oils and oil seeds, gums and resins, extracts and inspissated saps, dyes and tans. Under each of these heads the plants yielding them are arranged alphabetically, according to their scientific name. As an illustration we may quote a paragraph, taken hap-hazard from the section "oil and oil seeds," thus:—

"OLEA FERRUGINEA, *Ruple*: Oleagine.—In Afghanistan an oil is obtained from this tree which would doubtless take an important place in the oil trade were it procurable in large quantities; it is as good in quality as the ordinary Olive oil. The Olive tree, *Olea europæa*, Linn., has been introduced in the hills, and there seems no reason why India might not take a place amongst the countries which supply the Olive oil of commerce. Olive kernels yield 44 per cent. of oil, and Olive pulp 39 per cent."

This example of the way in which each product is treated will show the plan and scope of the book, for not only is information given as to the uses and commerce of the several plants, but suggestions are often thrown in as to the probable value of any given product as a new article of export. This will cause the book to be of special value in the hands of commercial men. The arrangement also of the products in groups will have the same advantage, and in the case where one or more product is yielded by the same plant the cross references from one to the other will be particularly useful, and indicates that much care has been given to its compilation. Sufficient has been given to show that the catalogue of the empire of India, though appearing last, is certainly not the least important of the many catalogues and handbooks that emanated from the recent Exhibition; indeed, we may say that it is both the best and cheapest book that has appeared, and those not interested in raw products will find more than a shilling's-worth (the price of the book) in the second part, which is devoted to the ethnological models and exhibits, for in this are excellent and readable descriptions of the several tribes and their productions.

THE NURSERY ON HARLOW MOOR.

CLOSE to the beautiful town of Harrogate, the favourite health resort of the North, lies Harlow Moor, which is a large expanse of land covered with Heather and Scotch Firs. From the summit of the Moor, which is about 500 feet above the level of the sea, very beautiful views are obtained of the surrounding country. The Scotch Firs make an excellent shelter, and, covering several acres, have a very fine effect. One would scarcely expect to see a thriving nursery garden on the very summit of the Moor, but such is the fact, and in Mr. Batchelor's hands it is rapidly extending. By great labour and perseverance some useful land has been cleared and brought into cultivation. Mr. Batchelor finds Roses do well here. His stock this season is very fine: both standards and dwarfs are good. Mr. Batchelor intends going in largely for Roses. Rhododendrons also do very well here, getting plenty of the breezy air of Harrogate. The plants show great vigour and robustness. He already has a fine stock of all the best named varieties, and intends going in largely for them. He intends working a great many this next season. Most kinds of hardy evergreen trees and shrubs do well in the soil here. In a wide border on each side of the road leading from the bog fields to the Moor, there are a great many choice trees and shrubs growing most luxuriantly. The common Laurels even on the very summit of the Moor thrive wonderfully well, and rarely suffer from the severe frost, and so with nearly all hardy trees and shrubs, they rarely suffer here from the severe frost of winter.

The light bright breezy dry air of Harrogate is most favourable for ripening the young wood, which in consequence rarely suffers from frost in severe winters. Carnations and Pinks seem to do well, and of these there is a large stock; there are many useful things among hardy plants. But besides a general outdoor nursery

stock, Mr. Batchelor has a good business in cut flowers and decorations. To meet the demand for flowers and plants, interiorly a considerable amount of glass is provided, every part of which is made the most use of that it is possible to do. There is a houseful of Gardenias, one of *Alhantums*, also one of *Azaleas*: together with some fine *Camellias*, *Indiarubber* plants, a quantity of young *Palms*, *Heaths*, *Genistas*, and *Hydrangeas*. Mr. Batchelor has a house chiefly of *Roses*, a quantity of *Teas* being planted in the houses to keep up a supply of flowers. On the rafters of some of the houses there are *Lupagæias*, both *alba* and *rosea*, also *fibriflunda*, and a great variety of other plants. Visitors to Harlow Heath should not fail to visit Harlow Nurseries; they will find many things there to interest them.

PARIS.

THE LOTTERY FOR THE PARIS GARDENERS.—As we have previously announced, among the plans for assisting the market gardeners and nurserymen so severely tried by recent hailstorms was a tombola, or lottery. Numerous contributions of works of art, pottery, plants, seeds, flowers, fruit, wines, engravings, photographs, &c., were made. The Syndical Chamber of Belgian Horticulturists sent more than a thousand plants. The sale of these varied articles realised about 8,000 francs, which was handed over to the National Horticultural Society. Twelve thousand tickets were sold, and 998 lots of articles were disposed of.

PARIS EXHIBITION 1889.

M. Alphonse, we are informed, engaged in organising the staff of the Paris Exhibition of 1889. M. Barlet, chief engineer of the promenades of Paris, and M. Kafariz, one of the city horticulturists, are charged with the management of the horticultural department.

THE POTATO EXPERIMENTS AT READING.

AGAINST the statement that any mistake has been made at Kew I desire to protest energetically.

What has really happened is as follows:—In the summer and autumn of 1883, at the instigation of Earl Cathcart, I took a great deal of pains to work out the characters and mutual relationships of the different wild types of tuberous Solanums. In a paper read before the Linean Society in January, 1884, I gave the characters and geographical distribution of about twenty wild types, classifying six of them as species and the remainder as varieties. Lord Cathcart asked more especially for any suggestions likely to be of economic use, and what I suggested was that each of these wild types should be separately individualised, and its economic value tested. At that time we had at Kew in cultivation three of the types described, namely, *tuberosum*, *Maglia*, and *Jamesii*. *Jamesii* grows very palatable tubers, but we never have got them larger than small marbles. Of our single *tuberosum* form the fully developed tubers are oblong, 4 or 5 inches long, with a thin smooth reddish-brown skin, and they weigh several ounces. It was that autumn that I first made out from the descriptions in the books and the dried specimens in the herbarium, that a form that Mr. P. L. Sclater had given us in 1862 was identical with the Chilean *Solanum Maglia*, as described by Dunal in Dr. Candolle's *Prodrôme*, and that the well-known plant figured by Sabine in the fifth volume of the *Transactions of the Horticultural Society* was also *S. Maglia*, and not *S. tuberosum*, as Dunal had stated. Lord Cathcart did not ask for any tubers of *S. Maglia* to experiment upon. At that time I do not believe that any of the English cultivators had so much as heard the name mentioned. I sent him, entirely on my own responsibility, a few tubers from this plant of Mr. Sclater's. I was then working at the paper and writing to him about Potato matters, frequently comparing ideas as we plodded on, step by step. I remember as distinctly as if it were yesterday sending him these said tubers. They were not so large as we sometimes get them, for the best, raised that year, had been already given away. There were six or eight of them, not larger than Walnuts; and round, and very wrinkled, by being kept some time in a dry dish,

the whole lot were packed in a small box, that was sent by letter, and perhaps weighed a couple of ounces. The whole box with its contents did not weigh as much as a single average tuber of our tuberosum, and that year we had saved no tubers of tuberosum at all. I brought the tubers over myself from the herbaceous ground to the herbarium, and I packed and directed the box to Lord Cathcart with my own hand. I speak, therefore, about a matter on which I have full personal knowledge when, I say, that Mr. Arthur Sutton's statement, that tubers [as grown at Kew] of tuberosum were sent to Lord Cathcart instead of those of S. Maglia, is incorrect.

What does Mr. Arthur Sutton know about the matter which he is speaking about so confidently? He had nothing to do with the criticised transaction whatever. He did not enter upon the scene till a year later, when the tubers had been a year out of my hands. He did not know that his Reading Maglia differed in any way from our Kew Maglia till I told him so myself this summer, when the tubers had been out of my hands three years. And now, because at the end of three years there is an appreciable difference between the Reading and the Kew types he jumps at the conclusion that the Kew people must have made a blunder, without taking time to consider whether the fact may not have some other explanation. It does not follow in the least, that because the two types are appreciably different, that the Kew people must have made a blunder. In those three years an accident may have happened to the tubers. We all know how easily such accidents happen in large gardens where many hands are employed. Botanical experiments of this sort are best carried on in small gardens, where the master is a man of leisure, and can look carefully after everything himself. I have no special reason to believe that in this particular case an accident has happened. In three years such a plant as a Potato that has always been grown in poor soil may be altered materially by being transferred to rich soil. This, to my own mind, is the most probable explanation of the difference that exists between the Kew type and the Reading type. M. Alphonse De Candolle, who has lately written a paper on the subject, and whose authority is of the very highest value, has in this recent paper, written after full study of my own paper and the *Botanical Magazine* figure of Maglia, whilst separating as species some of the forms I had classed under tuberosum, classified Maglia as a variety; and what he means by a variety is a form that differs from the type extremely little. Since 1853 we have ourselves at Kew grown S. Maglia in richer soil than before, and one of the characters which I relied upon as differential—the absence, in S. Maglia, of little leaflets intercalated between the big ones—has to some extent broken down. But, rejecting either of these two very probable explanations, Mr. Arthur Sutton has invented a third hypothesis—that the Kew people must have made a blunder. I think he has shown a want of care and consideration for other people in allowing a mere hypothetical suspicion to be treated as a fully ascertained fact, and instigating its dissemination as a fact in various newspapers. I am very sorry to have to write in this way about a man from whom I have received much help and kindness, but when an average reader of the *Times* or *Daily Telegraph* stops one of us in the street and asks if it be true that Suttons, of Reading, have grown a wonderful new Potato, and found the Kew people out in a blunder, it is perfectly impossible to make him understand what has really happened; and unless this story be explained now, when it first shows itself in black and white, it will soon pass into an accepted belief.

It is just one illustration more of the fact how easily things get misrepresented. The whole foundation of this new departure in Potato experimentalism was my own planning. Everybody at Kew has done everything that could possibly be done to help the matter forward; we have grown as many of the distinct types as we could get together; Sir Joseph Hooker has figured S. Maglia and S. Jamesii in the *Botanical Magazine*; we have written and answered letters innumerable; we have given away many hundreds of duplicate tubers; we have shown everything we had most freely to Messrs. Sutton and every one else interested in the matter; and the upshot of it is, that to-day the newspapers are accusing us of carelessness in a chorus which the chief experimenter leads. J. G. Baker.

A FASCIATED ROOT OF POTHOS AUREA.

I HAVE received from Herr F. M. Braun, of St. Petersburg, an aerial root of *Pothos aurea*, which may throw some light on the origin of fasciation. This specimen has the ordinary aerial roots of these plants about 5–6 centimetres long and 4 millimetres in diameter, and is characterised by a sudden arrest of growth, in consequence of which it has become thickened, and has all at once grown very strong (see fig. 140). Shortly after another arrest seems to have taken place, but this time the result was different. The tip of the root became black and died, and just above the decayed point a new root was produced differing from the original one in its flat shape.

On this root, as it now lies before me, a thickened ridge may be traced running from the point of junction on the one side to close by the same point on the other side, so that the root gives one the impression of three roots joined together. Further down a modification is to be found in the central portion. For about 12 centimetres of length it separates from

FIG. 140.—FASCIATED ROOT OF POTHOS.

one of the sides, and grows like an independent root; some millimetres further separation from the other side root takes place, while the central part is distinctly seen to consist of two roots joined together. These remain united for a further distance of 5 centimetres, and ultimately divide into two.

At a later date a normal secondary root has grown out above the starting point of the fasciation. The explanation of the fasciation is in this case clear—sudden and excessive flow of sap. In consequence of this the tip of the root at first became destroyed. In the tissue found close under the tip, there occurred a very extensive cell-division, resulting in the starting of three or perhaps four growing-points close against each other. A separation of the adjacent roots could not take place on the one side on account of the closely packed growing-points, nor on the other on account of the rapid development of new cells, so that the newly started roots were produced entire from the primary root.

As by degrees the sap, which was originally concentrated in one spot, became more equally diffused, division took place, and the epidermal cells were able to develop over each division separately instead of forming one uniform layer over the whole root. As this occurred, as the equilibrium in the flow of sap became re-established, the normal secondary root was developed. *Uto Dammr, Berlin.*

The Rosery.

ROSE MARIE VAN HOUTTE AND GLOIRE DE DIJON.

OF the several trees which we grow in pots for cut flowers the first named is the most free to blossom at this season of the year. Our plants of this variety, at the present time situated in an unheated house, where they have the benefit of free ventilation, have not, owing to the mildness of the season, received a check, and are now well furnished—as they have been for weeks past—with buds in various stages of development. The unexpanded blossoms of this kind are excellent for cutting purposes, and especially at this time are they valued here, although Eucharis, Bouvardias, Chrysanthemums, and some other equally choice flowers, are forthcoming in quantity. Unlike the buds of many varieties, those of Marie Van Houtte appear to withstand a considerable amount of damp without bluish, for although we have had an unusual long period of wet weather, their outside petals are free from decay, a defect which usually befalls many Roses which flower late.

Another Tea which is about to do us good service is Gloire de Dijon. We have a plant of this valuable old variety which was lifted in the spring of 1885, and planted in a house devoted to Rose culture. The plant when lifted was a strong one, having filled for two or three years a space on an outside wall. When taken indoors it was cut down moderately close to its base, and the ensuing summer it made numerous growths some 12 feet in length, the length of trellis-work; during the spring of this year these growths broke from almost every eye, and with but few exceptions they blossomed, producing such a mass of Roses as I have never seen equalled upon any one plant. Many were gathered for decorative purposes; in fact, it was a case of "cut and come again," without much perceptible thinning being observed. At the present time the plant is showing numerous buds from the points of the shoots laid-in this season, which will by mere preservation from frost yield a supply of flowers at a date when they will be invaluable. It has been remarked that this old Rose is too common to deserve root under glass, but no other in my opinion is more worthy of such a position. We have given its congener, Reine Marie Henriette, similar treatment with almost equal success. This variety, however, with us, is subject to mildew. I have read somewhere that it is a shy bloomer; such is not our experience of it, either in pots or planted out under glass. *Thomas Coomber.*

THE PARENTAGE OF THE ROSE LADY MARY FITZWILLIAM.

My attention having been called to the remark of "Wild Rose" in the *Gardeners' Chronicle* of November 6, 1886, p. 587, that the Rose Lady Mary Fitzwilliam is not a Tea Rose, I beg to state that I placed this Rose before the public as a seedling from devoniciensis. I can prove this Rose to be a seedling from devoniciensis on sworn evidence, corroborated beyond a doubt. I am bound to give this contradiction to "Wild Rose's" statement, or I must rest under the stigma of having willfully deceived the public. It now rests with "Wild Rose" to prove the truth of his assertion, or to withdraw it. *Henry Bennett.*

A NEW MIGNONETTE.

OUR illustration at p. 725, for which we are indebted to Mr. Cannell, gives a representation of a new variety of Mignonette recently sent out by Messrs. H. Cannell & Sons, of Swanley, Kent. The illustration fully explains itself, but we may add that a flowering stem was kindly forwarded to us for inspection by the firm, and on measuring it we found it to be over 24 inches in length! Another feature in this variety is the curiously twisted appearance of its flowering stems. (See fig. 141.)

HORTICULTURAL CLUB. — The next meeting of the Club will be held at the Club-room, Covent Garden Hotel, on December 7, when, after the dinner, Mr. T. FRANCIS RIVERS will open a discussion on "Pears and their Culture."

Orchid Notes and Cleanings.

ORCHIDS AT SUNBURY HOUSE.

THE number of specimens of Orchids here is both extensive and well grown, while in some instances the plants have attained enormous dimensions—a plant of Cattleya Mossiae, to wit, having upwards of sixty well-developed flower-sheaths. Among the many handsome species and varieties in blossom special mention may be made of Ansellia africana nitida, a splendid Orchid, dwarf in habit, freer flowering, and more showy than the typical A. africana. This variety is worth careful and special attention, even in the most select collections. Several Dendrobies were in bloom, including D. Dearei, with its lovely droop-

O. Uro-Skioneri, Oncidium Forbesii, Polystachys pubescens, contributed a grand display.

In the Cattleya-house the Cœlogyne Gardneriana was flowering freely, carrying four spikes of its waxy white blossoms; Oncidium bicolor is an attractive yellow-flowered species, and is here well represented; the rare Saccolabium bellinum was doing better here than I have seen it elsewhere, the warmest end of the Cattleya-house evidently suiting its requirements, the plant being in robust health, and developing two strong spikes of bloom. Some species, generally difficult to cultivate, are here grown admirably; for example, Epidendrum bicoloratum, E. Humboldtii, Coryanthes macrantha, Ionopsis paniculata, are all growing freely; but perhaps the most perfect example of successful cultivation is that of Renanthera coccinea, grown on stems of the Birch tree. I know that the practice is not a new one, as the late Mr. Speed, of Chatsworth, used to cultivate the plant in this

Vanda crerulea is also well grown in this garden. The plants are very healthy, and furnished with bright green leaves. One plant produced a handsome spike with twenty-three flowers. The temperature for this species should not be more than 50° to 55° during the winter months. After they have flowered they pass through their season of rest, and during winter do not require a very large supply of water. In our own garden we have at present seven plants (the whole stock) and every one of them has flowered as well this year as they did the last. They have been grown throughout in cool Cattleya-house temperature.

Dendrobium formosum is also here as a handsome specimen, with seven flowers on one spike. This is one of the most useful of Dendrobies; whose large handsome blooms last in perfection for three months. The plants require a high temperature and moist atmosphere when they are making their growth.

Dendrochilum Cabbianum is a recent species, curious, and sufficiently distinct, but the flowers lack the delicate perfume of D. glumaceum, or the elegance of D. filiforme. It may be worth growing as a variety. It had produced but one spike on a moderate-sized plant.

Trichosma suavis is another singular Orchid that was in flower; it is not plentiful in cultivation, but it is sufficiently pretty to be worth growing. The flowers are white, and resemble some of the small-growing Cœlogyoes; indeed, Lindley named it in the first place C. coronaria. It was first discovered by Mr. Gibson "upon trees in densely shaded woods near the summit of the hills" in the Chirra district of Khasia. He sent it to the Duke of Devonshire. The flowers have a sweet perfume, and are valuable on that account. J. D.

ORCHIDS AT STUDLEY HOUSE.

One of the best of recently formed collections of Orchids is that belonging to F. G. Tautz, Esq., Goldhawk Road, Hammersmith, which although situated so near to London, the plants appear to be in excellent condition. Mr. Tautz, who is an ardent lover of this family, takes great pains to learn the whole history, and to know thoroughly all about his plants, and has made, in a comparatively short space of time, a collection of the most valuable and select species and varieties. At the time of my visit, the following were in bloom:—*Lælia elegans* Wolstenholmei, *Odontoglossum maculatum* anceps, *Lælia purpurata* Russelliana, *Cattleya Dowringiana*, *Lycaste Skinneri* alba (with two flowers on a scape), *Cattleya exoniensis* (in bud), *Cypripedium cananthum* superbum, *C. Leeanum* superbum, *C. microchilum*, *C. vexillarium*, *C. Schlimii*, and *C. S. album* (a magnificent plant), *C. conchiferum*, *C. calurum* superbum, *C. Sedeni* superbum, *C. concolor*, *C. virens*, *C. Spicerianum* (in quantity), *Cœlogyne Massangeana*, *Oncidium Forbesii*, *O. tigrinum*, *O. varicosum*, *Lælia pumila* marginata, *Trichosma suavis*, *Odontoglossum Pescatorei*, *O. crispum* (very handsome form), *O. cariniferum*, *O. Roezlii*, *Cattleya luteola*, *Dendrobium formosum* giganteum, *D. ligibibum*, *D. superbiens*, the true autumn-flowering *Cattleya labiata*, *C. Dormaniana*, *C. Gaskelliana*, *Cymbidium affine*, the new *Spathoglottis agustorum*, and many others in sufficient numbers to make the flowering house especially gay and charming. In gloomy winter weather, these lovely Orchids are more appreciated, than is the case at other less dull times. The owner and his gardener (Mr. Cowley) work in unison, taking care that everything is properly done, the houses kept throughout in excellent order, and the plants free from insects of any kind.

Cypripedium are a special favourite with Mr. Tautz, and this collection is as nearly complete as it is possible to make it; the rare *C. Fairreanum* is represented by a beautiful specimen, while *C. Morganii*, *C. Wallisii*, *C. Sanderiana*, and *C. Schroëleri* may be specially mentioned.

In the East Indian-house are some magnificent specimen *Vandas* and *Aerides* of the best species, such as *V. Sanderiana*, *V. Lowii*, *V. suavis*, *V. crerulea*, *Aerides Houlettiana*, *A. Lawrencei*, *A. Regnierii*, a grand plant of the new *Saccolabium celeste*, *S. bellinum*, *Phaius tuberculatus*, and the new *Calanthe Sanderiana*, the latter a beautiful example of good culture.

The Cattleya-house contains some magnificent specimens of *C. Mendelii*, *C. Trianae*, *C. Warneri*, *C. Skinneri*, *C. S. alba*, *C. Percivaliana* alba, *C.*

FIG. 141.—MR. CANNELL'S NEW MIGNONETTE. (SEE P. 724.)

ing spikes of white and green flowers; the handsome North Australian *D. superbiens* and *D. bigibbum*; *D. formosum* giganteum are well grown. *Cypripedium* are largely grown, and include all the best known species and hybrids procurable. At the present time the most conspicuous in flower are the varieties of *C. insigne* and *C. Spicerianum*.

In the cool-house there are several pans of the lovely *Pleione Burmanica*, probably a variety of *P. Wallichiana*, and decidedly superior for decorative purposes. The varieties of *Lælia pumila* are special favourites of Major Leady, and the best varieties of *L. p. marginata* I have ever seen was in bloom at the time of my visit. The same may be said of *Odontoglossum roseum*, a comparatively small growing species, but which, when well cultivated, is a gem, its crimson-violet shaded blossoms contrasting well with *Odontoglossum crispum* and *O. Rossii majus*, whilst quantities of the brilliant *Sopronites grandiflora*, the rare *Masdevallia racemosa*, the beautiful *Oncidium Phalænopsis*, *Odontoglossum blandum*,

manner, and it is doubtless the best way of growing it, as is that position it roots abundantly, and grows freely. In this short notice I have mentioned a few only of the good things in this fine collection. G. J.

MR. COBB'S ORCHIDS.

Cattleya luteola.—This species is beautifully in flower in the garden of Mr. Walter Cobb, Silverdale Lodge, Sydenham. It is grown here, and also in Mr. Dorman's garden, under the name of *C. Holfordii*. Its correct name is *C. luteola*, being described by Dr. Lindley under that name in the *Gardeners' Chronicle* 1853, p. 774. There is a very correct representation of it in *Bot. Mag.*, t. 5032. Mr. Cobb's plant has three spikes, on one of which there are thirteen flowers. It is one of the very dwarf growing *Cattleyas* which succeed best in pans or baskets suspended from the roof; moreover it is very distinct and pretty, the flowers primrose with an orange blotch on the lip.

Wagner, C. Reineckiana, C. Morganica, C. nobilior, C. crispá Buchananiana, C. Triana-alba, C. Eldorado alba, Lælia callistoglossa, L. amanda, L. Perritz alba, L. euspatha, L. anceps Dawsoni, L. elegans Turneri (a superb variety), L. anceps Pevicaliana, &c., all in fine order. *Catleya gigas* and its varieties are now resting in a temperate-house. Very little water will be given to this section for the next three months, but on their commencing to grow they will be removed to warmer quarters, and supplied with plenty of water until the flowers expand. This treatment was adopted with much success by Mr. Cowley when Orchid-grower to the Rev. Mr. Norman, of Edgware, and might doubtless be applied to some other species with good results.

It is quite a pleasure to see the *Phalenopsis*, with their large thick healthy leaves and network of fleshy roots. They are suspended from the roof of the stove, the side stages being occupied with ornamental flowering and foliage plants. *Agreum cicutatum* was growing freely and showing flower. *A. Kotschyii* is a more difficult plant to cultivate, and makes but slow progress. *Dendrobium* occupy a great amount of space, and consist of the choicest kinds, such as *D. signatum*, *D. noble Cooksoni*, *D. Phalenopsis*, *D. endocharis*, *D. splendensissimum*, *D. striatotes*, &c.

The *Odontoglossum*-house contains some good specimens and fine varieties; there is a large quantity of *O. vexillarium* in the best of health, and the growth being sturdy and clean. *Masdevallias* and *Oncidium macranthum* occupy one end of this house, and are doing well; whilst magnificent specimens of *Cymbidium Lowianum*, the rare *Oncidium grandiflorum*, *O. incurvatum album*, *Miltonia spectabilis bicolor*, the white *Celestium cristata*, *Sobralia zantholeuca*, and a host of others were observed. *L. C.*

HOME CORRESPONDENCE.

Chiswick Red Tomato.—"H. E.'s" praise of this is well deserved, for it is of sturdy growth and very free; but lest any one should be led to try it for outdoor cultivation through the remark that it needs less heat than the larger sorts, I would remark that my experience with it during the past summer on a south-west wall was anything but satisfactory. I found that it ripened very slowly indeed, probably on account of the thickness and toughness of the skin. Thin-skinned varieties are early ripeners, and they are the best for outdoor culture. The yellow-skinned varieties well deserve a trial. *W. G.*

Zonal Pelargoniums in Winter.—At the Chrysanthemum show, held recently at Egham, a local gardener, Mr. Reddel, who makes such a striking and beautiful show of Fuchsias in the garden of his employer, Mr. Fice, of Egham, in the summer, exhibited six plants of zonal Pelargoniums, which were so beautiful as to merit the highest commendation. The plants were about 2 feet across, not more than 18 inches to the top of the bloom, which was so fine, rich, and perfect, as to fully equal if not to excel anything of the kind seen during the summer. These plants will remain, in a gentle heat quite as beautiful for a month or more longer, and will carry flowers nearly all the winter. It is strange, having regard to the comparative ease with which really good specimen zonal Pelargoniums can be grown fit for exhibition in November, that societies do not more widely encourage their appearance at the Chrysanthemum exhibitions, to which they would lend such glorious hues. The kinds in question were the fine crimson, H. Jacoby, Scarlet Dr. Oxton, and Mrs. Gordon, the latter a really fine flower; Woman in White, and Constance, pink, and singularly beautiful; and a pleasing violet shaded double, M^{me}. Leon Daboby. We sometimes see lists of kinds specially selected for winter blooming, but have rarely found any under proper treatment refusing to bloom well, and such is the singular refinement and finish given to the blooms under the dull winter sky that it is hard to tell which hues of colour are the most beautiful. Those who have visited Swanley in mid-winter, and there seen the houses of zonal Pelargoniums in bloom, have found it very hard indeed to declare which were the loveliest when all were lovely. It may be desirable to make selections which give free blooming and good habits of growth, but on the whole one kind when in bloom seems to be as acceptable as another. Many of our more recently introduced doubles have good compact habits now, and they are all the better suited for pot, and especially for winter pot culture. There is no special charm attached to the means of obtaining winter blooming plants. Spring-stuck cuttings potted on as required during the summer, kept well pinched, and liberal watering, and especially good

outdoors from the beginning of June till the middle of September; should, when finally in 8-inch pots, have heads, some 15 inches to 18 inches over, and compact without requiring a single stick or tie to keep shoot or flower in place. The last potting should take place at the end of August, and by the end of October the plants will be in good bloom. A gentle heat, ample light, and careful attention when damp prevails, are the chief essentials to success. *A. D.*

Adiantum Farleyense.—I have never known this lovely Fern to have spores. I have grown plants to 6 feet in diameter, and have exhibited them that size, plants of it are now being grown by me yet I have never seen a sign of fructification, nor did I ever hear of anybody else who did. Your correspondent asks how the first man's seedling is to be accounted for. Adam would thus have to be communicated with—a matter of some difficulty; but, apart from joking, if every seedling is to be accounted for, he would indeed have performed a gigantic work on hand. We all know that, in Ferns at any rate, they cannot be accounted for, though they frequently show signs of one parent at least. *Adiantum fragrantissimum* is an unknown seedling, but none the less beautiful. It is fertile. Why Farleyense is not I cannot say; but does it not point with certainty to its being a hybrid? I need to be told that this was an imported novelty when it first came out, and it might be, of course, and still be a hybrid. As an exhibitor I have dropped out of the ranks, but my enthusiasm is as great as ever, and photographs of my Fern treasures remind me pleasantly of past victories recorded in your columns, whilst medals and cups in abundance bear witness that I have been on many a battle-field. *T. M. Shuttleworth, F.L.S., F.R.E.S.*

"W. G.'s" inquiry as to the *Adiantum Farleyense* bearing spores is a question I have heard disputed more than once. I am not prepared to be so confident to say definitely it does bear them, but I am under the impression it does so on very rare occasions, and that the spores are so minute that they are scarcely discernible to the naked eye. If they do not carry spores where do the seedlings come from? Like the gardener that "W. G." mentions about at p. 692, we found a seedling this spring or early summer in a pot in which a *Clivia* was growing, and which could not possibly have got there except by means of a spore. *J. J. B.*

In answer to the query of your correspondent, "W. G.," on p. 692, of your last issue, I beg to inform him that though I have never seen a spore on this handsome Fern it has never less reproduced itself quite true from spores in my stove, the seedling having been found growing in the gravel under the heating pipes among a number of other self-sown Ferns some six or seven years ago, and having been carefully lifted into a pot, has now grown into a handsome plant quite insisting on a bushy form. The named plant purchased some years previously. I may add that the seedling appeared at the other end of the rather large house from that which was occupied by the parent plant. *W. E. Gumbleton.*

Juglans nigra, L.—In the *Gardeners' Chronicle* of November 15, I see it stated that this species in the neighbourhood of London rarely produces fully developed nuts, and, in fact, that hundreds of nuts were opened by the writer of that note, and all of them were found to be destitute of embryo. It may, perhaps, interest him and others to learn that about twelve years ago (I do not know the exact year) I gathered a few nuts of this Walnut in Kew Gardens under a good-sized tree there, and afterwards placed them carelessly in a small heap on the surface of the ground in my garden at Richmond, in Surrey, where I then resided. In the following year, much to my surprise, I observed that one of the nuts had germinated. I took care of the young plant and brought it in a pot to Barnsley, in the autumn of the year 1879, and planted it in the open ground in my garden here. It is now living, and measures in its present condition, after the fall of its leaves, 9 feet in height, and its stem measures 2 inches in diameter at its base, 14 inch at the height of 3 feet, and 1 inch at 4 feet above the ground. It is unlikely that any of the flowers of the tree in Kew Gardens had been artificially fertilised. *W. P. Hearn, The Castle, Barnsley.*

Pistia stratiotes.—Many are doubtless familiar with this interesting and highly ornamental water plant, notwithstanding the insignificance of its inflorescence. It is patent no one would ever grow it for the latter; but the beauty of its leaves, as well as the arrangement and delicate glaucous green colour, and their outline, will always secure it a place in the hot-house tanks of the curious. Although a native of the Tropics, its pliable constitution enables the plant to keep up a tolerable healthy and presentable appearance in the open air in this country during summer. In a warm tank, however, it is more at home, and gives evidence of this by its delicate and

pleasing hue of green, and by its enormous rate of increase by short runners or stolons. This extraordinary rate of vegetative reproduction is seen in most aquatics with which we are familiar, from *Lemna minor* up to the lordly *Pontederia crassipes*, which is also generally grown as a floating aquatic. The floating condition is apparently perfectly favourable to ordinary vegetative growth and reproduction; but many years ago it was observed that a greater vigour was induced if the water was shallow and the roots of the plant had access to a rich stratum of mud or soil. The roots in that case are better able to collect all the necessary constituents of plant life, and especially so the nitrates essential for the production of flowers and seeds. Cultivated on soil, the plant has recently and is even now producing abundantly and freely in the aquatic houses at Kew. There is a figure of the plant in the *Botanical Magazine*, t. 4564, J. F.

Lettuce.—When the crops of Lettuce are lifted to meet the demand during the winter months and placed in frames, pits, or other protection, there should be at least two lots coming forward to give supplies during spring and early summer months, and when there are no walls or other protection of such a serviceable character on the ground, other means must be adopted. We have found none to equal the sharp ridge throw up from 2 to 4 feet high, on which the plants are planted about 6 inches apart, and they can be lifted in spring, leaving the top a foot apart each way. The plants removed, invariably do well on a prepared plot, and the slight check gives a succession which is very valuable till spring sowings are ready for use in summer. When planting is done the holes formed by the use of the dibber are left till the ridge is planted, and are then filled up with finely sifted ashes and soot mixed. The whole surface among the young plants is dusted with the same material or wood-ashes, and ground or stone are thus kept in check; no loss of plants is sustained, and the depth of rich surface soil of which the ridge is formed allows deep rooting, and drought or damp, however severe, is harmless. All the Year Round, Hick's Hardy, and Bath Cos are excellent kinds. *Calverton.*

Mossy Stones as Ornaments in the Garden

—When pieces of stone, especially sandstone, are used about a garden for the shelter or general good of plants, they will be found in some situations to be completely coated with beautifully bright green moss. Having at Okwood a long mound in full view of the cottage windows, on which mound it was desirable to put some stone to prevent the soil washing away from the plants, I collected moss-covered pieces of stone, and sunk them about half their depth in the soil. The moss, though dried up in the summer, has become again bright green, so that in place of bare stones, we have a quite pretty object to look at at a time when flowers are almost over. It is possible that this may give a hint useful to some of your readers. *F. Wilson.*

Plant Physiology.—In the review of Mr. Molyneux's book on the Chrysanthemum, at p. 625, exception is taken to the chapter on leaf-ripening, as being dogmatic. No doubt whatever, to most persons it seems difficult to understand that any one should be able to recognise such plants as Chrysanthemums by their foliage features, but I had ample evidence, during last summer, that Mr. Molyneux possessed that capacity in a marked degree. It was my fortune to spend a day with him at Hockfield during that summer, just at the time when Mr. Wildsmith's 600 plants, consisting of many kinds over about 10 feet in height, were looking at them, was surprised at the ease with which Mr. Molyneux named kinds in rapid succession, recognising them solely by character of leafage, for there was little else by which to distinguish one from another except, perhaps, colour of stem. In all cases this leaf recognition proved correct, and I suggested that he should embody in his proposed book a chapter on plant physiology. It was quite evident to me that constant observation of the leafage and habit of the various kinds would enable an intelligent grower to become as familiar with his plants as a shepherd is said to become familiar with the comparatively similar faces of his sheep. *A. D.*

The Gardeners' Royal Benevolent Institution.—The suggestion of your correspondent, Mr. Perkins (p. 692), is a capital one indeed, and one I think which would be favourably received throughout the country. It is true our churches are greatly indebted to gardeners for the ever-ending supplies of plants and flowers supplied on all festive occasions; and I think it the duty of the different dioceses to be consulted on the subject, and the facts relating to this admirable Institution laid before them, pointing out the good that has been done and is being done, there is no doubt whatever that they would receive the proposal in a fair and generous manner, and would consent to a collection being made in all churches, and other places of worship throughout the country in the year

1887. This would form an interesting item in the annals of the Gardeners' Royal Benevolent Institution as a handsome donation from the Church to commemorate the jubilee year of Her Majesty the Queen. I might suggest that a strong and thoroughly representative committee be chosen in the different districts to carry forward the proposal, so as to insure a thorough success. R. Greenhill, Priory Gardens, Warwick.

Proliferation of *Sedum reflexum*.—Proliferation of this species seems to be not infrequent, especially when it flowers late, and probably this is one of the principal conditions and causes of it. Growth becomes arrested (that is, vegetative growth) in the usual manner, and the inflorescence makes its appearance in due course and form. The fanlike, many-branched cymose inflorescence becomes fully and perfectly formed, and many, if not all, of the flowers expand, commencing with that terminating the floral axis. I have never observed proliferation in the latter flower, but after a time most of the other flowers on the branches of the cyme, instead of carrying out the functions of reproduction, become green, and then sepals, petals, and pistil assume the form of young leaves. The internodes gradually elongate, carrying the several floral whorls apart, giving the whole flower the appearance of a branch, which in reality it is. The apices of the branches of the cyme show the greatest inclination to develop, and generally take the lead, while the flowers developing into branches below that, are dwarfed by comparison. The whole inflorescence, however, presents rather a singular appearance, for instead of flowers developing and maturing seed, we have a group of slender branches on the flower-stalk. There is a figure of the species in *English Botany*, 695. On the rockery at Kew at the present time is a variety generally known as *S. r. monstrosum*, which shows proliferation at the apices of the branches only of the inflorescence. J. F.

Father Camell's Plants.—The writer of the paragraph on p. 639 has not got to Louvain to obtain information about F. Camell's work. We have in the Botanical Department of the British Museum the types of the plants enumerated in the appendix to Kay's *Historia*, and also a very important volume of drawings and MSS. descriptions, amounting in all to 634 in number. The figures are well executed, and the MSS. accompanying them beautiful specimens of calligraphy. The volume is prefaced by a note in F. Camell's hand, which runs:—"Descriptiones Fructuum et Arborum, Luzmisi quas Georgius Josephus Camell, Dns. Dori Wihelmi Ten Rhyn Batavian mitterbat anno 1700: nunc ve Domino Jacobo Petiverio Pharmacopœo Londinensi, et Regiæ Societatis Socio, mittit, anno 1701." The writer says "the real name was Camell," but its owner wrote it "Camel"—this may, however, have been only a Latinised form. There is no such thing as an Order of Jesuits. The proper title is "the Company" or "Society of Jesus," the members of which are called Jesuits. The distinction is not one without a difference, though it may appear so to some. Several MSS. and letters of F. Camell are in the British Museum (Sloane MSS., 2947, 3324, 4040). *James Britton.* [Camell is heard, a common Moravian name. Ed.]

Spinach.—This is one of the most wholesome vegetables extant, and greatly valued (by those who can appreciate it) all the year round. During summer it is very liable to "bolt" to seed, and must be sown on cool, deep, and rich soil. A shady position during the summer months is very desirable. Sowings made every ten days or so among fruit bushes, or between other crops, in most cases meet all demands. For winter supplies thoroughly trenched ground, which has been well manured in previous years, is very suitable. When the plants are fairly up they should be partially thinned to let them develop themselves, and when 1½ inch high they may be thinned out in zig-zag form, and the thinnings planted on good ground in rows a foot or more apart in the rows, and about 6 inches from plant to plant. These become very sturdy, frost, and damp resisting plants. To keep grubs and clubs in check a good dusting of sifted ashes and soot mixed may be given, and repeated. We have four in this season so treated, and have not lost a plant yet. A good supply is maintained, and growing freely during this mild weather. *Calcuttina*.

Eucalypti in Arran.—I have been much interested in the correspondence on the Eucalyptus as grown in the island of Arran. I may state for your information that several plants of the Eucalyptus are growing at Auchincross, Portencross, West Kilbride, which is thirteen miles east of Lamlash, and ten miles east of Corrie, in Arran. A seedling of 1881 was planted outside in 1883, and is now 22 feet in height. Several seedlings of 1885 were planted outside this summer, and are now 12 feet in height, having grown this season 6 feet 6 inches. The plants are grown on light soil sheltered from east and north-

east winds, at about 60 yards above high-water mark. J. Maclean, The Gardens, Auchincross, near Ailsbidge.

Reports of Societies.

BIRMINGHAM CHRYSANTHEMUM : November 24 and 25.

This show was held in the Town Hall, which was well filled. It was the twenty-sixth exhibition of the Society, and was considered to be in all respects one of the best yet held. Cut blooms were staged in large numbers, and were generally of good quality. Plants were also well shown, and were of excellent quality. Bouquets and Primulas kept up the usual high standard of excellence found at the Birmingham shows.

PLANTS IN POTS, &c.

For nine large flowering Chrysanthemums (Japanese excluded) Mr. C. Brassier, gr. to T. Martineau, Esq., was 1st in this set with plants 4 feet in diameter. Jardin des Plantes was very rich in colour. Mr. H. Dyer, gr. to Mrs. Marigold, Edgbaston, also showed good specimens, the best being *Lady Slide*.

Mr. J. Crook, gr. to W. Millward, Esq., Edgbaston, was 1st for six plants, neatly trained, composed of leafy varieties.

Mr. E. Cooper, gr. to J. Chamberlain, Esq., M.P., Highbury, staged the best single specimen, incurved, which was a very fine plant of *White Venus*, 4 to 5 feet across.

Mr. Brassier occupied the same place in the Japanese class with a fine lot of *Coquet Frit*; and was 1st for six pompons, lightly trained; Mr. Dyer following also with freely trained plants.

CUT BLOOMS.

As has been said, were staged in large numbers, and made an imposing array. In the leading class for forty-eight blooms, twenty-four to be incurved, and the remainder Japanese (distinct), there were eleven competitors. This class was remarkable for the successful appearance of a new grower in Chrysanthemum culture in Mr. R. Parker, gr. to J. Corbett, Esq., Impney Hill, Droitwich, who was an easy 1st, staging magnificent blooms in both sections, being both solid and fresh, and of capital finish, the best being *Trioispe de la Rue des Châlets*, Mons. Astorg, Belle Plaine, Flamme de Punch, Fair Maid of Guernsey, *Jeanne d'Arc*, Queen of England, Prince Alfred, John Salter, and Lord Alcester. Mr. W. Comfort, gr. to J. A. Everitt, Esq., was 2d, staging very fine Japanese; he had fine blooms of *Jeanne Delaux* and *Boule d'Or*.

For twenty-four blooms, twelve to be incurved and the same number of Japanese, there were twelve competitors, the best being staged by Mr. Barker, gr. to Lord Hindlip, Hindlip Hall, the Japanese being very fine, while the incurved were extra large, though rather wanting in finish.

For eighteen incurved distinct, Mr. Barker had the best, but was disqualified for staging two blooms of *Princess of Wales*; Mr. W. Comfort accordingly received 1st for mediums 2d, but not blooms.

Mr. Barker was the fore for Japanese, twelve varieties, with large, even, bright blooms; Mr. R. Parker was a close 2d.

Mr. Barker was again to the front for twelve Anemone blooms.

Mr. A. Johnson, gr. to R. Ramsden, Esq., Knowle, was 1st for twenty-four varieties, distinct, twelve Japanese and twelve incurved, and to be grown within two miles of St. Stephen's Place, and very fine they were.

Reflexed blooms were well shown by Mr. Comfort, who was 1st.

Mr. Brassier took leading honours in the miscellaneous plant class of nine specimens (Chrysanthemums excluded) with a fine group, plants of *Croton Veitchii* nicely coloured, and *Calliandra purpurea* being best.

MISCELLANEOUS.

Mr. T. B. Thompson, Spark Hill Nurseries, Birmingham, showed a fine group, consisting of Palms, Grasses, Oracneas, Heaths, and Tulips, effectively arranged.

Mr. Hans Niemand, Royal Nurseries, Harborne Road, Edgbaston, had a grove kind of arrangement of richly coloured Crotons, finely grown Palms, and *Calla æthiopica*, on a groundwork of Ferns, and *Panicum*; Roman Hyacinths and other plants were freely used. These two groups evoked general admiration.

Messrs. Pope & Sons staged a fine bank of zonal Pelargoniums having splendid trusses of blooms—about one hundred plants in 48 sized pots; the new semi-double variety, *Le Brun*, rich scarlet, being one of the most noteworthy kinds. A choice collection of wreaths and crosses from the same firm were much admired.

Messrs. H. Cannell & Sons, Swanley, Kent, had a

choice collection of cut zonal Pelargonium blooms and Chrysanthemums.

Primulas were well shown by Messrs. Thompson and Messrs. Pope; and Camellias were well represented by Messrs. Perkins, Coventry; Mr. Hans Niemand, and others.

A well arranged group of Chrysanthemums was shown by Mr. J. H. Horton, gr. to R. Chamberlain, Esq., Edgbaston, with good plants bearing fine blooms.

FRUIT.

Apples were shown in large numbers, 450 dishes being staged.

For a collection of miscellaneous fruit of six dishes, distinct, Mr. E. Gilmour, gr. to the Earl of Shrewsbury and Talbot, Ingestrie Hall, was 1st with very fine Alicante and Muscat of Alexandria Grapes, and Charlotte Rothschild Pine-apple, all good. Mr. Parker was 2d, and had the same kinds of Grapes in good order.

For three bunches of black Grapes Mr. W. J. Thornton, gr. to W. Bissano, Esq., Old Hill, was 1st, with Alicante, fine.

Mr. Gilmour took leading honours for white Grapes (Muscats excluded).

Mr. J. Pass was 1st for one bunch of black Grapes, staging Alicante in fine condition.

For the best twelve dishes of Apples, six to be dessert and six culinary Mr. W. Bannister was 1st, with extra fine Yorkshire Greening, Peasegood's Non-such, Ribston Pippin, and King of the Pippins.

Mr. Mason won 1st prize for six dishes, half culinary others dessert, with fine produce.

For twelve dishes Pears, distinct varieties, Mr. Barker was awarded the 1st prize.

Very fine collections of Apples came from Messrs. R. Smith & Co., Worcester, and Mr. Bunyard, Kent, consisting of about 100 dishes in each collection of the finest varieties, highly coloured. To these collections were awarded Certificates of Merit.

LIVERPOOL HORTICULTURAL.

The seven-th show of this Society was opened on Tuesday in the dearest of weathers. Never before was such a grand exhibition of cut flowers and fruit seen in Liverpool at this season of the year; the cut flowers were superb, the incurves were by far the best we have seen this season, and Japanese quite up to the mark; the 1st prize lot were indeed a grand sight.

We have seen larger and better specimen of incurved kind, but the pompons were very fine.

In the plant classes, prizes were well competed for in all departments. Stove and greenhouse plants were well done.

Amongst orchids, although not great in quantity, some good things were shown; the 1st prize lot, from Mr. H. Tall, jun., gardener to J. Edwards, Esq., contained a magnificent specimen of *Oncidium variegatum* with two grand branching spikes—one of the best we have seen for some time.

Table plants were very good, several good collections being staged. Primulas and Cyclamens were poor, but Roman Hyacinths, Mignonette, and Epiphyllums were good.

The cut flowers, taken all round, were excellent, the leading class being well filled; the quality of the flowers was as good as possible.

A new feature was introduced by the committee offering a prize for six Japanese and six incurved, to be competed for by those who have never won a prize. This was well responded to, some excellent flowers being staged, which speaks well for the future prospect of the culture of this favourite flower. The prize for the premier flower, both incurved and Japanese, was found in the stand of Mr. Wilson, gr. to J. E. Reynolds, Esq., Sandford Park, the former being a grand flower of Lord Alcester, and the latter an equally fine example of *Boule d'Or*.

FRUIT.

made a most magnificent display, especially Grapes, which were fine in colour and finish, about 130 bunches being put up. Those from Mr. Goodacre, of Elvaston, Mr. Lindsay, and Mr. Holbigsworth being particularly fine. The fine apples were both numerous and good; Apples and Pears also. Mr. Mackenzie, of Linton Park, Midstone, was successful in these classes; and Mr. Goodacre took 1st for both the collection of twelve and six varieties of fruit with a grand lot.

In the miscellaneous exhibits, Messrs. Kerr & Sons, Aigburth, showed a magnificent group of well grown Cyclamen and Roman Hyacinths on a groundwork of Maidenhair, nicely relieved by *Cocos Weddelliana*, producing a fine effect, and was highly commended.

The same award was made to Mr. Cowan, of Garston, for a group of miniature group and well flowered Chrysanthemums, Ericas, Ferns, six foliaged plants.

Messrs. F. & A. Dickson, Chester, were highly commended for Tree Carnations in flower, and for a collection of fruit, &c.

Mr. Wm. Cuthash, of Highgate, contributed a collection of miscellaneous plants suitable for decorative purposes.

Messrs. Rylance showed a collection of fruit, as did Mr. Smith of Rock Ferry.

The attendance was very large, the large hall being crowded with visitors during the time the show remained open. It is pleasing to record, that the decision of the judges gave the greatest satisfaction to all concerned.

TRADE NOTICES.

Owing to continued ill-health, Mr. C. Young is compelled to withdraw from active life, and to relinquish the home business at Upper Tooting Park Nursery, which he has carried on for the last quarter of a century. He has disposed of the above nursery and stock-in-trade to Mr. John R. Box, formerly partner with Mr. John Ling, Stanstead Park Nurseries, Forest Hill, S.E.

We understand that Mr. J. H. Heathman, who was formerly employed by Messrs. Merryweather & Sons at 63, Long Acre, W.C., is no longer in their service, and is not authorised to represent them in any respect.

THE POTATO TRICENTENARY.

THE CONFERENCE.

MR. CARRUTHERS, P.L.S., took the chair at the inaugural meeting on Thursday. The first paper read was one by Mr. W. S. Mitchell, entitled, "Historic Consideration of the question whence came the Potato to England." Mr. Mitchell's paper has already appeared in substance in our columns. It must here suffice to say that the author in his paper sifted the evidence of the arrival of the Potato in England, and discussed such points as the first illustration of the plant which appeared in the first edition of Gerard's *Herbal* of 1597, the fact that Sir Walter Raleigh was never in Virginia, and that the Potato of Sir John Hawkings was the Sweet Potato, *Convolvulus Batatas*. Drake, he considered, might have obtained it in the open market at Carthagena, or possibly from some Spanish ship boarded and plundered by him in the open sea.

The paper on "Drake's Expedition of 1586," by Mr. W. Herries Pollock, M.A., was read by Sir Richard Pollock.

The important paper on "Cultivation by the Incas and other Andean Nations," read by Mr. Clements Markham, proved even more interesting than his hearers had anticipated. The ancient civilisation of that Master-Race, the Incas, or "Children of the Sun," and especially their agricultural economy, was described in eloquent language and in attractive detail. Many facts were brought to view probably for the first time, in the course of this paper, and which will have to be carefully weighed in future both by botanists and historical inquirers. With regard to the way in which the Potato came to us from Virginia Mr. Carruthers significantly remarked that a plant may be embarked on a certain port without necessarily being a native of the adjacent country, and we may readily believe, from what Mr. Clements Markham has so forcibly brought before us, that the Potato may have reached Virginia from the South, as it certainly did Carthagena, as a food plant, introduced for its merits. Mr. Markham's paper greatly strengthens this position, showing, as it does, that the Potato, on the arrival of the Spaniards, was spread over 70° or 75° of latitude, extending from Chili to Colombia, as a plant of utility, important in the agriculture of that wide region, and existing in numerous cultivated varieties. The "Children of the Sun," said Mr. Markham, deserve our gratitude for having detected the merits of the wild Potato, and for having first improved it and handed it over to other nations as one of the most important food plants of the world. It seems that nine "best sorts" were grown on a site not far distant from Callao, 7000 feet above the level of the sea, and they are described in the paper as of excellent quality. It is difficult to avoid the conclusion that an esculent of so much merit, and one so widely known, may have reached Virginia centuries before the period of Sir Francis Drake.

Mr. Baker, before reading his own paper on the

wild species of Potatoes as at present recognised, alluded in enthusiastic terms to Mr. Markham's paper.

A paper on "The Introduction of the Potato into France" was read by M. Henry L. de Vilmorin.

"The Potato Disease" was the last subject on the card for discussion, but the time at which we had to go to press prevented our obtaining any report of these papers, or of those read on Friday; hence we must defer further mention of them till our next issue.

THE EXHIBITION.

The competitive exhibition of Potatoes comprised two classes—the first for collections of not less than six and not more than twelve varieties, twelve tubers of each being shown, and as these were exhibited, six on each plate, a collection of twelve varieties was actually enlarged to twenty-four dishes. Three prizes were offered, viz., a Gold Medal, a Silver Medal, and a Bronze Medal, commemorative of the Tercentenary Exhibition. In the other class a Silver Medal was awarded for the best new variety of Potato produced during the last two years and not yet in the market. Some twenty-six collections competed in the first class, and the Gold Medal was awarded to Mr. E. Chopping, Periwinkle Mills, Milton, near Sittingbourne, who had a remarkably good collection for the season of the year, consisting of white rounds:—Schoolmaster and the Colonel; white kidneys, Abundance and Chancellor; coloured rounds, Adirondack, Village Blacksmith, Reading Russet, and Purple Perfection; coloured kidneys, Reading Ruby and Belle, in the way of Queen of the Valley; Rufus and White Elephant. The Silver Medal was awarded to Mr. J. H. Diver, Pitshill, Petworth, Sussex, also with a very good lot, consisting of white rounds:—Washington Hero and Schoolmaster; white kidneys: Reading Giant, International, and Snowflake; coloured rounds: Reading Russet, The Dean, Vicar of Laleham, and Adirondack; coloured kidneys: Mr. Breesee, White Elephant, and Edgemoor Purple. The Bronze Medal went to Mr. William Ker, Durgavel, Dumfries, who had of white rounds: Mammoth Pearl, Schoolmaster, and Eclipse; coloured rounds: Village Blacksmith, Adirondack, Queen of the Valley, and Vicar of Laleham; white kidneys: International, Snowdrop, and Chancellor; coloured kidneys: Mr. Breesee and White Elephant. The following collections were highly commended:—From Mr. E. S. Wiles, The Gardens, Edgemoor Park, Banbury; Mr. J. Hughes, The Gardens, Eydon Hall, Eyfield, both showing collections of twelve and six varieties; and Mr. C. Fidler, potato grower, Reading, for three collections, comprising seventy-two dishes, nearly all dissimilar, and considered to be a good representative collection.

Among the collections not for competition was one of about 150 dishes, shown by Mr. John Watkies, Pomona Farm, Hereford, the most attractive-looking being Village Blacksmith, Fidler's Enterprise, The Dean, Edgemoor Purple, Reading Russet, Adirondack, Vicar of Laleham, Scotch Blue, and Pride of Ontario. Messrs. Hooper & Co., Centre Row, Covent Garden, also showed a collection, including good samples of Adirondack, London Hero, Chancellor, Edgemoor Purple, Hooper's Paragon, The Dean, Reading Russet, &c. Messrs. Vilmorin & Co., of Paris and London, exhibit a dozen dishes of French varieties of Potatoes, including Saucisse, red kidney; Joseph Rignault, white kidney; Princesse, white kidney; Marjolain Tetard, white kidney; Seville d'Orti, white kidney; and Blanchard, round. Also some shallow wicker baskets, in which sprouted seed Potatoes are placed and sent away to their customers.

Mr. M. J. C. Buckley, of London, exhibited some souvenirs from Raleigh House, Voughal, Co. Cork, including a photograph showing the oriel window to which Raleigh so much referred—the spot where it is believed the first Potato introduced to Ireland by Raleigh was grown, and the Vew tree under which he and Spenser sat, and where it is believed Spenser composed a great portion of his *Fairie Queene*. Accompanying it was a peculiar shovel used by the Irish labourers in lifting Potatoes, a wicker basket commonly used for the dug Potato, a small beech pail out of which they drink butter-milk, and samples of the white Rock Potato grown in that part of the country.

There were nine entries for the special Silver Medal for the best new Potato not yet in commerce; and after the samples had been carefully cooked on the spot in one of Bower's patent Potato-steamers the Medal was awarded to Mr. James Lye, The Gardens,

Clyffe Hall, Market Lavington, Wilts, for Clipper, a white round of a refined Regent type, handsome, early, a good cropper, and promising to make an excellent market variety. The next two best were King of Russels, also from Mr. Lye, a good-looking red round, of the character of Adirondack, but deeper in colour, being russety-red; and Mottled Beauty, from Mr. E. S. Wiles, a rather large and handsome pale kidney, mottled with dull wine-brown, like Fidler's Enterprise, yellow flesh, and, like King of Russels, cooks dry and floury.

Obituary.

WILLIAM FROMOW.—We learn with regret of the death, in his seventy-second year, of Mr. Fromow, of the Sutton Court Nurseries, Chiswick. Born in July, 1815, at Attleborough, Norfolk, he came to Chiswick in 1829 with his father, who established in a very small way the business now known as W. Fromow & Sons. About a year and a half after settling in Chiswick Mr. Fromow died, leaving the nursery in the hands of his son (who was only about fifteen years old at the time) and widow. Latterly Mr. Fromow's sons have been carrying on the business, which they have also considerably extended. Mr. Fromow died rather suddenly, on November 27, from an affection of the heart.

MR. CHARLES GREEN.—We regret to announce the death of Mr. Charles Green, formerly Head Gardener to Mr. Wilson Saunders, and more recently to Sir G. Macleay, Bart., Pendell Court. He was a frequent contributor to the columns of this journal, his extensive knowledge of plants, especially of rare and almost forgotten species, and his skill as a cultivator rendering his articles of great value to gardeners.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON.

Nov. 25.—Dense cold fog till 2 P.M., fine with thin mist afterwards.

— 26.—Fine, but dull and overcast all day.

— 27.—Very dull and overcast throughout.

— 28.—Mist in early morning, overcast all day.

— 29.—Fet till 10 A.M., fine and bright afterwards.

— 30.—Wet till morning, dull and overcast afternoon.

Dec. 1.—Fine and bright day, dull at times.

LONDON: Atmospheric Pressure.—During the week ending November 27, the reading of the barometer at the level of the sea increased from 30.36 inches at the beginning of the week, to 30.73 inches by the afternoon of the 24th, decreased to 30.58 inches by the afternoon of the 25th, increased to 30.60 inches by the morning of the 26th, and was 30.49 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.56 inches, being 0.72 inch higher than last week, and 0.68 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 49.6 on the 21st; the highest

on the 24th was 39°.5. The mean of the seven high day temperatures was 45°.5.

The lowest in the week was 27°.2 on the 24th; the lowest on the 21st was 45°. The mean of the seven low night temperatures was 34°.2.

The greatest range of temperature in one day was 17° on the 25th; the smallest was 4°.6 on the 21st. The mean of the seven daily ranges was 11°.3.

The mean daily temperatures were 47°.5 on the 21st, 38°.9 on the 22d, 33°.3 on the 23d, 33°.5 on the 24th, 38°.6 on the 25th, 43°.4 on the 26th, and 43°.8 on the 27th. These were above their averages on the 21st, 26th, and 27th by 5°.8, 1°.7, and 2°.2 above, and below on the 22d, 23d, 24th, and 25th by 2°.8, 8°.4, 8°.1, and 1°.3 respectively.

The mean temperature of the week was 39°.8, being 5°.3 lower than last week, and 1°.8 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 80° on the 22d. The mean of the seven readings was 58°.4.

Rain.—Rain fell on one day to the amount of 0.02 inch.

ENGLAND: Temperature.—During the week ending November 27, the highest temperatures were 56° at Leeds, 55° at Truro, and 54°.8 at Plymouth; the highest at Blackheath was 49°.6, at Liverpool 49°.9, and at Sheffield 51°. The general mean was 52°.5.

The lowest in the week were at Cambridge 25°.5, at Blackheath 27°.2, and at Hull 29°; the lowest at Liverpool was 40°.3, at Preston 4°.8, and at Plymouth 36°. The general mean was 32°.7.

The greatest ranges of temperature were at Cambridge 25°.6, at Hull 25°, and at Leeds 24°; the least ranges were 9°.6 at Liverpool, 13° at Preston, and 17°.3 at Brighton. The general mean was 19°.8.

The mean of the seven high day temperatures was highest at Truro 52.7°, at Plymouth 51.5°, and at Leeds 50°; and lowest at Blackheath 45°.5, at Cambridge 46°.5, and at Hull 46°.7. The general mean was 48°.4.

The mean of the seven low night temperatures was highest at Truro, 43°.6, at Liverpool 43°.2 and at Preston 42°.7; and was lowest at Hull 34°.1, at Blackheath 34°.2, and at Cambridge 34°.7. The general mean was 38°.8.

The mean of the seven daily ranges was greatest at Sunderland, 13°.8, at Hull 12°.6, and at Cambridge 11°.8; and least at Liverpool, 4°.7, at Preston 5°.6, and at Brighton 7°.5. The general mean was 9°.6.

The mean temperature was highest at Truro, 48°, at Plymouth 46°.4, and at Liverpool 45°.4; and lowest at Blackheath, 39°.8, at Hull 40°.2, and at Cambridge 40°.4. The general mean was 43°.4.

Rain.—The largest falls were 0.08 inch at Liverpool, 0.07 inch at Preston, and 0.06 inch at Truro. No rain fell at several stations. The general mean fall was 0.03 inch.

SCOTLAND: Temperature.—During the week ending November 27, the highest temperature was 57° at Glasgow and Paisley; the highest at Leith was 52°.4. The general mean was 55°.3.

The lowest temperature was 28°.4 at Dundee; the lowest at Greenock was 35°.2. The general mean was 31°.8.

The mean temperature was highest at Edinburgh, 45°.3; and lowest at Aberdeen, 42°.2. The general mean was 44°.

Rain.—The largest fall was 0.40 inch at Perth; no rain fell at Dundee. The general mean fall was 0.11 inch.

JAMES GLAISHER, F.R.S.

Variorum.

THOMAS RIVERS.—The following anecdote is extracted from the second volume of Mr. Roach Smith's Retrospections:—"I accompanied from Temple Place the eminent gardener, Mr. Thomas Rivers, to Leeds Castle, by invitation, to inspect a Peach border in which the trees were in a most flourishing condition in respect to foliage and wood, but they did not produce fruit. It was autumn, and this year my Peach trees at Temple Place bore abundantly. Mr. Rivers' practised eye enabled him in a moment to name the different kinds. Tasting an Early Anoe, he remarked, "Now this is a Peach we consider quite second-rate, but here it is in perfection, and very delicious. It is ever the case; fruits in high

perfection, though of inferior kinds, will often beat the better sorts not so well matured." His knowledge of trees in general was as profound as his pomology: "earing, . . . We walked from Maidstone, reaching Leeds Castle early in the afternoon. After lunch we were introduced to the Peach border. It was of considerable length, and fully 8 feet wide, stocked with trees of vigorous growth, but totally without fruit. 'I should imagine,' said Mr. Rivers, smiling, 'that the Peach border must be a nice little annuity for some Maidstone gardener. I should like you, sir, to see Roach Smith's Peach trees. I am not sure they have any borders at all; the roots of the trees are under gravel walks. Your trees are fed by rich earth, which promotes this exuberant growth of wood and causes barrenness in fruit.' He then gave directions that the ground should be laid open; that clay should be laid upon the roots after root-pruning, and that a gravel path should be made within a foot from the wall.

Enquiries.

"He that questioneth much shall learn much"—BACON. BEE PLANTS: T. B. S. would be glad to have the name of a nurseryman who sells seeds of plants good for bee food.

Answers to Correspondents.

TO THE TRADE.—Members of the Trade will oblige by sending notes of matters of Trade Interest, Cultural or Commercial. Short notes of daily experience are what are most useful.

ASCOT SHOW: Addenda. On the last evening of the Ascot Chrysanthemum Show, Messrs. Standish & Co. presented the Hon. Mrs. Ponsonby with a splendid bouquet; the firm was also awarded the Silver Medal of the National Chrysanthemum Society for a group of Chrysanthemums, and two Awards of Merit for the group of foliage plants and cut Bouvardias, &c.

BULBS: A. C. The bulbs which you send are attacked by the Elecharis mite, to which we have so frequently referred. Burn the affected bulbs.

CARNATIONS: G. M. Your plants are eaten up by minute worms, easily visible by a low power of the microscope. They were figured at p. 721, vol. xvi., 1881. We are afraid you can do nothing but burn the stock and start again in fresh soil.

CELERY: A. C. The variety which you name is considered to be one of the best. The seed is attacked by the fungus Puccinia bulbosa, of which an illustration will be given next week. You had better burn the diseased plants.

CHRYSANTHEMUM MRS. NORMAN DAVIS: E. Mizen. This is a very fine incurved sport from Princess of Teck, clear sulphur-yellow. It does not excel Mrs. Bunn, which is nearly of the same tint; but being a late bloomer it is an acquisition.

CHRYSANTHEMUM SPORT: W. B. S. The flower resembles Kosciusko sitarum, but, as seen, it is not so good a flower. It may come another season in better form, or it may revert.

ECHARIS MITE: J. H. & S. You will find a figure of this in our columns for April 4, 1885, p. 440.

LYCATE SKINNER: L. S. W. This Orchid seldom produces two flowers on a spike, although the incipient flower-bud is often present, but it usually comes to nothing.

NAMES OF FRUITS: G. T. C. Duchesse d'Angoulême.—E. W. Van Mons' Léon Leclerc.

NAMES OF PLANTS: Southampton. Plectranthus barbatus.—W. S. C. P. 1, Malva purpurata.—M. R. S. Scabious species: cannot say which from unopened immature blooms.—J. W. W. Hakea laurina.—Pflinger & Co. We cannot name plants from a single leaf.—R. C. K. Lelia prestans.—J. H. r. Hæmæanthus ob punctatus; 2, Erica melanthera; 3, Adiantum Capillus-venereus var.; 4, Vanda leaf has "spots," grow it cooler and nearer the glass; 5, Maxillaria punctata; 7, Epidendrum ciliare, a very low form.—J. Fox. Abies nobilis var.

PRUNING APPLE TREES: S. W. V. You may prune the trees at any time during mild weather. The Pears that bloom and do not fruit require root-pruning, or, better, lifting and replanting in less rich soil.

SWEET WILLIAM LEAVES: T. H. P. Your plants are affected with the fungus described and figured in our number for August 21, 1886.

UVA GRASS: J. P. What is meant is probably Uva-grass, Zostera marina, which is generally known as &c., and which was at one time recommended as a material for making paper.

VANDA CŒRULEA: J. Waldie. The flower is a very fine one.

Markets.

COVENT GARDEN, December 2.

[The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the correctness of the market quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Ed.]

LARGE consignments of Nova Scotia, Canada, and Boston Apples to hand, prices ruling low. Hothouse fruit in good supply, with short demand, without alteration. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES. Apples, 15-sieve 1.0-1.3 Lemons, per case .12 2-0 3 Pears, per dozen .11 1-0 1 Pineapples, Eng, lb. 1 6-2 0 St. Michael, each 1 6-6 6

SEEDS. LONDON: Dec. 1.—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, E.C., report the market to-day as quiet, with a firm feeling for all descriptions. Red Clover seed is very steady; there will be very little choice new English this season. Trefoils continue to tend in an upward direction. There is no change in either white Clover or Alsike. Rye-grasses are more in favour, the advance in perennials being fully maintaining a

Despite some heavy arrivals of Canary seed the article is still strong. Rape seed remains unaltered. Temptingly low rates now prevail for Hemp seed. More attention is being devoted to blue Peas. Haricots are good and cheap. Linsed is easier.

CORN.

MARK LANE: Nov. 29.—Excepting for Australian and Indian no advance was quoted to-day for either English or foreign Wheat, but at the current rates of this day week holders were firm. There was only a limited business, purchases being confined chiefly to small quantities. English white Wheats ranged up to 3s. 6d., and red up to 3s. 5d. Flour, with a moderate inquiry, was fully supported. The Barley trade was inactive, and quotations were nominally unaltered. Beans were dearer. Peas were 6d. to 1s. higher. For Oats buyers operated with reserve: prices were weaker.

Dec. 1.—The hardening of prices for most kinds of grain continued. The demand for Wheat was limited, but prices follow the upward movement, and 3d. over Monday's rates have been paid for Russian, American, and Indian. Flour was if anything still firmer, and for reputed marks of American 3d. to 6d. advance was quoted. Barley was quiet. Beans were a very strong market, and tending against buyers. Peas were scarce, and dearer to buy. Maize was in scanty supply, and hardening in value. Oats were dull of sale, and stocks heavy.

Average prices of corn for the week ending Nov. 27:—Wheat, 3s. 11d.; Barley, 2s. 7d.; Oats, 16s. 7d. For the corresponding period last year:—Wheat, 30s. 9d.; Barley, 29s. 6d.; Oats, 18s. 7d.

FRUIT AND VEGETABLES.

COLUMBIA (East London): Dec. 1.—Trade has been brisk at the following quotations:—Apples, 3s. 6d. to 7s. 6d. per bushel; Pears, 4s. to 10s. do.; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; Spinach, 1s. to 2s. per sieve; Cauliflowers, 1s. to 2s. per dozen; Cabbages, 2s. to 2s. 6d. per tally; Savoys, 1s. 6d. to 3s. do.; Onions, 3s. 6d. to 4s. 2d. per cwt.; Carrots, 20s. to 28s. per ton; Mangels, 15s. to 18s. do.; Greens, 1s. to 1s. 3d. per dozen bunches; Carrots, 1s. 6d. to 2s. do.

STRATFORD: Nov. 30.—The market has been well supplied, and a good trade was done at the under-mentioned prices:—Savoys, 2s. 6d. to 3s. per tally; Greens, 1s. to 1s. 6d. per dozen bunches; Cauliflowers, 1s. to 1s. 6d. per dozen; Turnips, 1s. 6d. to 2s. per dozen bunches; do., 2s. to 3s. per ton; Carrots (household), 2s. to 3s. do.; do. (cattle feeding), 20s. to 22s. 6d. do.; Parsnips, 6d. to 1s. per score; Mangels, 13s. 6d. to 17s. 6d. per ton; Swedes, 15s. to 22s. do.; Watercress, 6d. per dozen; Apples, 11s. to 12s. per bushel; do., 5s. 6d. to 7s. per half-bushel.

POTATOS.

BOROUGH AND SPITALFIELDS: Nov. 30.—Trade continues steady for good samples, and dull for inferior. Quotations:—Regents, 70s. to 110s.; Magnum Bonum, 55s. to 60s.; Novus, 70s. to 80s.; Champignons, 50s. to 70s.; and Hebrons, 80s. to 110s. per ton.

COLUMBIA (East London): Dec. 1.—The trade here was dull, at the following prices:—Essex Regents, 65s. to 80s.; Magnum Bonum, 55s. to 70s.; Cambridgeshire Regents, 65s. to 70s.; York and Lincoln Magnums, 60s. to 70s.; Regents, 70s. to 80s. per ton.

STRATFORD: Nov. 30.—Quotations:—Best Magnum, 60s. to 80s.; second do., 50s. to 55s.; Champignons, 55s. to 65s.; and Regents, 65s. to 85s. per ton.

Imports.—The imports into London last week consisted of 64 bags from Rotterdam, 1175 (Ghent, 2473 Hamburg, 80 Bremen, 30 Roulogne, 40 Ostend, 1500 Settin, and 600 Antwerp.

HAY.

WHITECHAPEL: Nov. 30.—There were fair supplies on sale to-day, and a slow trade at previous rates for all articles. Quotations:—Clover, prime, 88s. to 100s.; inferior, 70s. to 84s.; hay, prime, 70s. to 90s.; inferior, 30s. to 65s.; and straw, 28s. to 40s. per load.

Dec. 2.—There was a short supply on offer. The trade was quiet, at late rates.

CUMBERLAND (REGENT'S PARK): Nov. 30.—A large supply of clover and meadow hay, with drooping prices. A fair supply of straw and a fair trade. Quotations:—Clover, best, 84s. to 100s.; second, 70s. to 80s.; hay, best, 78s. to 85s.; second, 50s. to 70s.; and straw, 28s. to 35s. per load.

STRATFORD: Dec. 1.—Quotations:—Hay, 70s. to 80s.; Clover, 70s. to 60s.; and straw, 28s. to 35s. per load.

Government Stock.—Consols closed on Monday at the figures of the preceding Saturday—viz., 102½ to 102¼ for both delivery and the account. Tuesday's figures were as on the previous day for delivery, and 100¼ to 100½ for the account. Wednesday's closing figures were 100½ to 100¼ for delivery, and 102½ to 100¼ for the account—both ex div.—Thursday's final quotations were 100½ to 100¼ for delivery, and 100½ to 101½ for the account (ex div.)

SPECIAL NOTICE.—

On and after Jan. 1, 1887, the Price of the

"GARDENERS' CHRONICLE"

will be

Reduced to Three Pence.

SMITHFIELD SHOW,

December 6 to 10, 1886.

STAND No. 61, NORTH GALLERY.

JAMES CARTER & CO.

Respectfully invite the attention of Visitors to the magnificent display of

ENGLISH-GROWN TOBACCO

IN GROWTH, CURED, AND MANUFACTURED.

Together with their CELEBRATED GRASS SEEDS, in Sample and Growth; and the GIGANTIC ROOTS grown from Carters' Seeds.

SERJEANTS BY ROYAL COMMANDS TO H.M. THE QUEEN AND H.R.H. THE PRINCE OF WALES,

237 High Holborn, London, W.C.

HAMPTON COURT BLACK HAMBURG FINES.—Extra strong Fruiting Cues of the above, and all other leading varieties, at greatly reduced prices. T. JACKSON AND SON, Nurseries, Kingston-on-Thames, and Royal Kitchen Gardens, Hampton Court.

DARTMOUTH CRAB. NOTICE.

HAVING purchased the principal part of Mr. Laxton's Stock of this handsome fruit, we are able to supply the Trade at 15s. per dozen. It is a remarkable sort, in size and colour resembling a large Victoria Plum. Good dessert quality, vigorous grower, and very fertile. Stock very limited. Order early.

HARRISON & SONS, ROYAL NURSERIES, LEICESTER.

KELP — KELP — KELP.

This powerful and stimulating Ash, made from the sundried plants of Laminaria digitata and other selected seaweeds, is especially rich in Potash, and Phosphoric Acid. Mixed with three times its bulk of dry soil, its effect on Vine Borders, Tomato Plants, and nearly all Pot Plants, is marked and beneficial, while no better dressing exists for Potatoes, Peas, Seakale, and Celery. It is an excellent Renovator for Old Garden Soil, and exhausted and Moss-grown Lawns. Price (for cash with order only) 8s. per bushel—bag included. Cheap through rates via Southampton or Weymouth.

J. E. FREY, La Poudreterie, St. Martin's, Jersey. N.B.—As the seaweeds selected for this Ash can only be harvested during the spring tides of the four summer months, and then at some distance from the mainland, the supply is necessarily limited, and Orders will therefore be executed in strict rotation.

COCOA-NUT FIBRE REFUSE.

Newly made. Truckload (2 tons) 6s.; 40 bags, 25s. Free on rail. Cash with order.—J. STEVENS AND CO., Fibre Merchants, 153, High Street, Battersea, S.W.

Illustrated Lists of Wooden Buildings, Greenhouses, and Conservatories, and Concrete Slabs for Walls, Paths, and Stages, sent post-free on application.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH,

for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 50 gallons each, at 11. 6d. per gallon, at the Manu factory, or 14. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALFRED LOWE, Esq., *The Keys, Alcester Lodge*.
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH,
Brierly Hill Ironworks, near Dudley;
118, Queen Victoria Street, London, E.C.; and

WANTED, an ASSISTANT SHOPMAN, of good address, with fair knowledge of Garden and Farm Seeds.—Full particulars to W. M. D., Waste, Nash & Co., 79, Southwark Street, London, S.E.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 17, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or fictitious names are not forwarded, but are at once returned to the writers.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS. JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter.—Enquiries should be made to 237 and 238, High Holborn, W.C.

Gardeners, Under Gardeners, Bailiffs, &c. W. M. CUTBUSH and SON have at the present time on their List Men, whose characters are the result of a strict investigation, and such as from their personal knowledge can recommend as to abilities, &c.—Ladies and Gentlemen requiring either of the above can be suited with reliable, first-class men by applying to Wm. Cutbush & Son, Highgate Nurseries, London, N.

Gardeners. THOMAS KENNEDY and CO. have on their Register a number of first-class GARDENERS, FORESTERS, &c., wishing engagement, and will be glad to furnish particulars to any Lady, Nobleman, or Gentleman. THOMAS KENNEDY and CO., 108, High Street, Dumfries, N.B.

SCOTCH GARDENERS. S—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

MANAGER.—To Grow extensively for Market, Grapes, Peaches, Strawberries, Cucumbers, Tomatoes, Kioses, Gardenias, &c., and all the requirements of a first class Fruit and Cut Flower Trade. Highest references.—G. A. J., Athelston Road, Harold Wood, Romford.

GARDENER (HEAD), age 32.—Mr. LEACH, Head Gardener, Albany Park, Guildford, can highly recommend a thorough first-class Gardener.—Address as above.

GARDENER (HEAD).—Good Grower of Choice Fruit, Flowers, and Vegetables, also Early and Late Forcing. Good character for ability, sobriety, and industry.—5, Colbrook Lane, Twickenham.

GARDENER (HEAD); age 38, married, no family. Advertiser is open to engage with any Lady, N.bleman, or Gentleman requiring a thoroughly practical man in all branches of Gardening.—GEORGE MORRIS, Chapel Square, Kimbolton St. Neuts.

GARDENER (HEAD WORKING).—Age 32, married, one child; thoroughly experienced. Good character.—W. WALDING, Willoughby House, Rugby.

GARDENER (HEAD WORKING), who help is given.—Single; thirteen years' practical experience; very highly recommended. Abstainer.—W. GOLD SMITH, Poleston, D'Arking, Surrey.

GARDENER (HEAD WORKING).—Age 38, married six years, no family; sixteen years' previous character, being well versed in all branches, including Meadow Law. Well recommended in all respects. Management of Men.—G. MARSHALL, South Holme Wood, Dorking.

GARDENER.—Sir HUMPHREY DE TRAFFORD will be glad to recommend his Gardener, and can give him a nine years' character. Leaving through no fault.—Sir HUMPHREY DE TRAFFORD, Trafford Park, Manchester.

GARDENER.—A GENTLEMAN, leaving his present situation, wishes to commend his Gardener, who has been in his service nearly four years. He is a steady, trustworthy, and willing man. He will take entire charge, or work as second, and can make himself generally useful.—Stearfield, Faignton, South Devon.

GARDENER.—A GENTLEMAN wishes to recommend as a thoroughly good Gardener, Stephen Elkington, age 46, married, three children. Served with Sir Henry Dryden, Bart., and many years with the late Philip Fox, Esq., of Richmond. He is a noted lover of Flowers.—EGERTON HUBBARD, Esq., M.P., Addington Manor, Winslow, Bucks.

GARDENER (UNDER).—Used to Horse and Poultry; or permanent Nursery employment. Good reference from London Nursery.—H. SOLLY, High Street, Ash, Sandwich, Kent.

GARDENER (UNDER, or would take a small SINGLE HANDED place, or as COWMAN and assist in Garden on Gentlemen's estate.—Married; four and a half years' reference.—A. B., Dennis Road, East Molesey.

GARDENER (UNDER); age 22.—Mr. W. WALTON, Gardener, at Twyford Abbey, Ealing, W., will be pleased to recommend Joseph Adams, leaving through employer giving up.

GARDENER (UNDER), or IMPROVER in a Gentleman's Garden.—A GARDENER wishes to recommend a youth (age 18); five years' experience.—HEAD GARDENER, Walcot Hill, Doncaster.

FOREMAN.—A. GIBSON, Gardener to F. T. Barnaby Atkins, Esq., Halsestead Place, Sevenoaks, Kent, will be pleased to recommend Robert Johnson, as Foreman. He has lived on this estate as Foreman for the last three years. He is well up in Plant and Fruit Culture, and is a thorough good workman.

To Nurserymen. FOREMAN, or BRANCH NURSERY MANAGER. Advertiser will be disengaged about the end of December, and is now open to engage with any one requiring the services of an honest, sober, and energetic man. Has had twenty-two years' experience in London and provincial nurseries, inside and out. Most satisfactory references.—J. H. GIBBS, 27, Walker Street, Flookersbrook, Chester.

To Nurserymen. FOREMAN PROPAGATOR, or GROWER.—Good experience in the Cultivation of Plants.—W. M. D., Waste, Nash & Co., Kent.

FOREMAN (WORKING) PROPAGATOR.—A GENTLEMAN can produce Soft-wooded Plants, Cut Flowers in large quantities. Good Salesman. Good character.—LAMBERT, 1, Bailey's Lane, Stamford Hill, London, N.

SPECIAL NOTICE.—

On and after Jan. 1, 1887, the Price of the "GARDENERS' CHRONICLE" will be

Reduced to Three Pence.

MARKET GROWER and PROPAGATOR of Pot Roses, Choice Fruit, &c.—a. E. Bulb, Lily of the Valley, Ferns, and other Plants for Cut Blooms. Long practice in all classes.—A. B., 112, High Street, Fulham, S.W.

JOURNEYMAN (FIRST), indoors, in a good establishment; age 23.—Mr. C. MARSHALL would be pleased to recommend any one to any Gardener requiring a steady young man.—C. MARSHALL, Arbory Gardens, Nunaton, Warwickshire.

JOURNEYMAN, in good establishment.—Age 20; five and a half years' experience. Good testimonials.—H. EVANS, Hovingham Hall, Yorkshire.

JOURNEYMAN, in the Houses in a large Garden; age 23.—The GARDENERS, Emwirth House, Emwirth, can thoroughly recommend a young man as above.

JOURNEYMAN, in the Houses.—Age 23; acquainted with Orchids, &c. Good references.—B. EYE, Blackwater, Farnborough, Hants.

IMPROVER, or UNDER GARDENER.—Age 19; 12; good references.—GARDENER, Woodhorse House, Nottingham.

IMPROVER, in a Gentleman's Garden.—Age 19; four years' experience.—W. WOODLEY, Batmansley, Lynton, Hants.

TO GARDENERS.—Wanted a situation under a Gardener, by a youth (age 18). Good reference.—L. LARKINGTON, Thorney, near Peterborough, Cambridgeshire.

TO GENTLEMEN, NURSERYMEN, &c.—A Youth (age 18) requires a situation, in or out of a Gentleman's Estate, or in a Nursery. Good character.—T. S., 51, St. Stephen's Street, Toubridge, Kent.

MANAGER, TRAVELLER, or HEAD SHOPMAN.—Many years' experience in London and the Provinces in every branch of the business. Good Book-keeper and Correspondent. Fair Knowledge of Plants.—FESTUCA, Hurst & Son, Houndsditch, E.

MANAGER, or HEAD SHOPMAN.—The Advertiser seeks an engagement as above, or other responsible position. Twelve years' experience in the Seed and Nursery Trade; four years in present situation; first class references.—H. L., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

To the Trade. SALESMAN or MANAGER.—Used to shipping trade; well up in Floral Work. Could Travel, Manage Branch Establishment for Market. Twenty years' character and experience. Cash security.—TRADE, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

To Nurserymen and Seedsmen. TRAVELLER, or MANAGER, seeks an engagement as either of the above. Married, experienced. Highly recommended.—TRADE, 37, Paveway Road, Eastbourne.

Seed Trade. SHOPMAN, or WAREHOUSEMAN.—Five years' experience; thorough knowledge of the Seed Trade.—First-class references.—D. C. FLETCHER, 172, Edginton Street, Glasgow.

SHOPMAN, or ASSISTANT.—Age 25; experienced in Seeds, Plants, Flowers, &c. Good references.—A. B., 37, St. George Square, Tonbridge Road Maidstone.

Seed Trade. SHOPMAN, or ASSISTANT.—Age 22; five years' experience in first-class Scotch house. Good references.—T. C. DICKSONS and CO., 1, Waterloo Place, Edinburgh.

SHOPMAN (ASSISTANT), in Seed Trade.—Age 20; stout, active, has practical knowledge of Gardening.—W. L., 57, Gordon Street, Glasgow.

To the Seed Trade. ASSISTANT.—Seven years' experience in every department. Good references.—J. W. K., 31, Roxburgh Street, Kelso, N. B.

COWMAN, and to assist in Garden.—Married, two children; can Manage Horse and Trap, and is generally useful; can Drive. Two years' character.—F. H., 17, Holloway Road, Baltham, S. W.

HOLLOWAY'S OINTMENT and PILLS.

—The sudden changes, frequent fits, and prevailing dampness sorely impede the vital functions and conduce to illness. The remedy for these distresses lies in some purifying medicine, like these Pills, which is competent to grapple with the mischief at its sources and stamp it out without fretting the nerves, or weakening the system. The pills extract from the blood all noxious matters, regulate the action of every disordered organ, stimulate the liver and kidneys, and relax the bowels.

In curing chest complaints, these Pills are remarkably effective, especially when aided by friction of the Ointment on its walls. The double treatment will ensure a certain, steady, and benevolent progress, and sound health will soon be re-established.

THOMAS GREEN & SON LIMITED,

Smithfield Iron Works, Leeds, and Surrey Works, Blackfriars Road, London, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their

PATENT WROUGHT-IRON MUNICIPAL OR ANGULAR CHAMBERED AND TUBULAR HOT-WATER BOILERS,

And others with **SHELVES**, and Hollow or Ordinary Cast-iron **GRATE BARS**.

SADDLE BOILERS, With **WATERWAY BACKS** and **WELDED BOILERS**, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Hall, Warehouses, Workshops, &c. They are the nearest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the **FIRST and HIGHEST PRIZE, a SILVER MEDAL**, at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

— FRONT ELEVATION —

— LONGITUDINAL SECTION —

SECTIONAL PLAN.

The longitudinal section gives a view of the fire-box, water space, &c.
The front elevation shows it set in brickwork, which is necessary for this class of boiler.

The cross section gives a view of the fire-box, water space, and V shaped back.

TESTIMONIAL.

Messrs. THOS. GREEN AND SON, LTD., NORTH ST., LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds,
January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably. I am, Gentlemen, yours truly,

THOS. HEWSON, Borough Engineer.

HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

BARR'S
 BEAUTIFUL HARDY
DAFFODILS.

"That come before the swallow darts, and take The winds of March with beauty."

BARR & SON, 12, King St., Covent Garden, W.C.

BARR'S NEW OR RARE HARDY DAFFODILS
 for Pot-culture, Flower Beds, Borders, &c. For descriptive List of Varieties, see Advertisement in the *Gardeners' Chronicle*, October 29th; or send for B. & S.'s Illustrated Daffodil Catalogue, free on application. These beautiful Daffodils surpass all other spring flowers for in and out-of-door decoration, and as cut flowers rank with the Orchid and the Rose. In the London Spring Flower Shows, for 20 years Barr & Son's Daff. has obtained a leading position, and are acknowledged to be the latest among spring flowers.

THE ALDBOROUGH COLLECTION OF CHOICE DAFFODILS.—TRUMPET, NONSUCH, PEERLESS, EUCHEARIS-FLOWERED, NELSON'S, BARR'S, BURBIDGE'S, &c. DAFFODILS.
 3 each of 15 varieties 53s. 34s., to 105s.
 1 each of 25 varieties 21s. 30s. to 42s.
 1 each of 30 varieties 30s. 42s. to 63s.
 5 each of 12 varieties 10s. 6d., 16s. to 25s.
 5 each of 12 varieties 15s. 21s. to 30s.
 3 " " " " 10s. 6d., 15s. to 21s.
 3 " " " " 7s. 6d., 10s. 6d., 10s. 15s.
 4 " " " " 5s. 6d. to 7s. 6d.

BARR'S INEXPENSIVE HARDY DAFFODILS,
 in Beds, surpass in beauty and effect all other spring flowers, and for Massed Flower Borders they have no equal. In Shrubberies they are most valuable, and when the Daffodil is required as Cut Flowers, beds should be planted in the Kitchen Garden. If as a Forced Flower they are wanted, plant thickly in boxes 6 by 15 inches, and 4 inches deep, and stand the boxes out-of-doors, covered with ashes or coarse fibre, till the boxes are full of roots. If for Pot-culture, plant three or more bulbs in a pot, and place them out-of-doors until the pots are full of roots. For Naturalisation, plant in grass or by lakes, streams and ornamental waters, and thus realize what Wordsworth saw when he penned the following:—
 "I wandered lonely as a cloud
 That floats on high o'er vales and hills,
 When all at once I saw a crowd,
 A host of golden Daffodils;
 Beside the lake, beneath the trees,
 Fluttering and dancing in the breeze."
 The culture of the Daffodil is simple, growing in all soils and all situations; 60 an acre of frost or unfavourable weather will injure bulb or flower. Those who have only an unheated greenhouse can keep it gay with these flowers from January to May.

ASSORTMENTS OF INEXPENSIVE DAFFODILS, EMBRACING TRUMPETS, NONSUCH, POETICUS, &c.
 1000 in 10 varieties, 84s.; in 20 varieties, 120s.; in 30 vars., 135s. 500 to 10 varieties, 45s.; in 20 varieties, 65s.; in 30 var., 80s. 100 to 10 varieties, 15s. 6d.; in 20 var., 21s. 30 to 10 varieties, 12s. 6d.; in 15 var., 9s. 15 to 10 vars., 12s. 6d. 12 to 10 varieties, 4s. 6d.; in 15 var., 7s. 6d.; in 30 var., 12s. 6d. 12 to 10 varieties, 3s. 6d.; 4s. 6d.; 5s. 6d. 12 to 10 var.

THE FINEST
LATE YELLOW
CHRYSANTHEMUM

IN CULTIVATION for CUTTING PURPOSES

"MRS. JONES,"

WHICH WAS AWARDED A

FIRST-CLASS CERTIFICATE

BY THE

NATIONAL CHRYSANTHEMUM
SOCIETY,
THIS SEASON.

It is a sport from the well-known Japanese variety "ETHEL," and is the exact counterpart of that favourite variety in every way, excepting the colour, which is a beautiful rich bright golden-yellow, distinct in colour from every variety in cultivation. I shall have no quantity of flowers until CHRISTMAS, the main batch will be at their best from that time until the END OF JANUARY; showing it to be a specially LATE-flowering variety.

Having pushed on a few plants for exhibition I can cut a few flowers at once, and shall be glad to post specimen blooms to any who would like to see them.

Established Plants, ready April 1,

1s. 6d., each, 15s. per doz., 100s. per 100.

Price per 1000 upon application.

**THE EARLIEST OF ALL
POTATOS.**

SHARPE'S VICTOR.

Sharpe's Victor is a seedling raised from the Alma
Kidney and the old early short-top round Potato. It is
earlier than any present variety, and having a very short
top it is especially suitable for frame cultivation. Its pre-
cocity is such that it can be had fit for the table in eight
weeks, or less, from the time of planting, and there is no
difficulty in securing new Potatoes for the table every day
in the year. Victor is a flattened roundish oval in shape,
with a beautiful clear skin and extremely shallow eyes,
being one of the handsomest as well as the heaviest
cropper of any variety adapted for frame work, or for a
dish on his employer's table on March 3; from planting to
lifting being only SIX WEEKS.

Several seasons' trials have fully confirmed all that
has been said in favour of the Victor Potato. It is proved
to be the earliest, most prolific, and best flavoured of all
the early Potatoes; and for pot culture is unrivalled.

Price, 6d. per Pound.

Messrs. J. & J. ELLISON write as follows:—

"Mr. Usher, Gardener to C. H. Johnson, Esq., Thorburn-
hall Hall, planted Victor Potatoes on January 26, and placed a
dish on his employer's table on March 3; from planting to
lifting being only SIX WEEKS."

"Mr. MELVILLE, Gardener to Mrs. Hornsby, St. Vincent's,
Grantham, has this season grown the Victor Potato fit for table
in SIX WEEKS from planting."

DARTMOUTH CROB.

NOTICE.

HAVING purchased the principal part of
Mr. Laxton's Stock of this handsome
fruit, we are able to supply the Trade at 15s.
per dozen. It is a remarkable sort, in size and
colour resembling a large Victoria Plum. Good
dessert quality, vigorous grower, and very fertile.
Stock very limited. Order early.

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 11, 1886.

THE IMPROVEMENT OF
PLANTS.

EVERY seedsman may be a plant improver,
whether he cultivate a thousand acres
or only so much ground as will fill a flower-pot.
Messrs. Dickson, Brown, & Tait, of Corpora-
tion Street, Manchester, are not engaged either
in field culture or garden culture, but they are
improvers of plants nevertheless, since they
have built up their reputation by the distribution
of the best seeds that could possibly be ob-
tained. They hold a few acres as a trial-ground
for testing seeds, where the various stocks of
vegetables or roots are subjected to critical
examination, and their characters duly regis-
tered. The distributor of seeds is not usually
himself a plant-improver at home (although
there are some very remarkable exceptions to
this rule), but his business as a large trader
makes it advantageous to him to reward the
actual plant-improver, so as to gain possession
of superior strains, and to keep himself "at the
front" by the only means which are certain not
to fail. It is in the field or garden that the
final appeal as to quality takes place. There the
trial is made under the consumer's own eye, and
he is enabled to ascertain, not only whether a
thing is good, but whether it is suitable for
his soil and for his purposes. Such evidence
cannot be resisted, and every one must have
noticed how telling it proves. It is this weighing
of seedsmen in the balance which, in its results,
obtains for them new customers or loses them
their old ones, which gains them fame or
failure.

The very small seedsmen must always be
at a disadvantage, as general distributors,
compared with the great houses, since they
do not possess the same opportunities of
enlisting the services of experts in plant-im-
provement, so as to obtain the best possible
stocks. It is true that their business may grow
from small beginnings, but the small tradesman,
so long as he is small, can hardly send out stock
seeds to the various growers of each particular
sort—horticultural and agricultural—selecting
the right men as growers and improvers, as well
as the best districts for the best production of
each kind of seed. "Little boats should keep
near the shore," and the small seedsmen should
either purchase most of their goods of the
great houses, or they should confine their
attention to the growth of one or two sorts of
seeds only. It may here be mentioned that
Messrs. Dickson, Brown & Tait have intro-
duced many well-known and widely grown
fruits, vegetables, and flowers. There are few
Cauliflowers in greater demand than their
Eclipse, the sale of which is increasing, its
quality, flavour, size, and adaptability for either
private or market gardens, gaining for its
introducers many of those testimonials which

**CHARLES SHARPE & CO.,
SLEAFORD.**

people send unasked for the relief of their feelings. They possess a Beet which bears out my remark on the usual course of plant improvement, since it was raised by Mr. Hope, gardener to the Earl of Jersey, of Middleton, Stoney Park. To cite another case, they have arranged to distribute the Penrhy Seedling Melon; and to send out the Clumber Seedling Cucumber; while Mr. H. Moore, Peel Park, Manchester, has placed in their hands the stock of a new Tomato, a cross between Conqueror and Vicks' Criterion. The Best of All Melon is an older introduction, a cross between Colston Bassett and Golden Gem, possessing the beautiful netting of the former and the bright deep orange colour of the rind of the latter. It weighs three or four pounds, and needs no further praise, after all that the horticultural Press has already given to it, since a large proportion of exhibited Melons are of this variety.

Besides the actual improvements by experts Messrs. Dickson, Brown & Tait, spare no pains in thoroughly cleaning all seeds, sending them out entirely free from weeds, or any other misplaced matter, such as dirt or rubbish, everything being rubbish which is not the seed you bargained for. No seeds are sent out that do not, on trial, reach the highest percentage of germination. It would interest and satisfy all the customers of this firm if they only saw the working of their very complete system of testing and cleaning the various seeds before they are sent out.

The extent of the business in grass seeds in the agricultural department, and in Dutch bulbs, is surprising. Hundreds of thousands of Tulips and Hyacinths are annually imported from Holland, the firm being among the largest importers in England, while in grass seeds the trade is very large. New seeds of grasses and Clovers sufficient to sow 10,000 acres had already been received from various sources at home and abroad, and stored in the warehouses, in the middle of November, and this did not exceed more than one-fourth part of the quantity which had still to come from the growers for the supply of next year's trade.

Grass seeds are either sold separately or mixed in such proportions as Messrs. Dickson, Brown & Tait, may deem to be expedient either for permanent or temporary pastures on various soils. They guarantee the percentage of growth and the purity of all these seeds, and we are assured that the greatly increased trade in the seeds of permanent pastures which set in six or seven years ago still continues, and shows no present sign of abatement. Messrs. Dickson, Brown & Tait were among the first firms who offered guarantees for the seeds they supply.

THE BULB GARDEN.

LILIES.

THE various species of Lilies, more especially *L. auratum*, will all need to be reported at once. They should not have been left out of doors exposed to all sorts of weather, but kept comparatively dry at the roots, and in a well ventilated greenhouse, and now, when they are turned out of the pots, the roots will be found matted together into a compact mass. Two classes of roots are observable, the most numerous being those from the base of the old stems. They are tough and fibrous. A set of thicker and more fleshy roots are produced from the base of the bulbs. Our method of procedure is to take hold of the stem firmly, twisting it out from the crown with the mass of roots attached. The roots from the base of the bulbs are not disturbed at all, and in repotting care is taken to keep the mass intact. We use for potting soil about equal portions of peat and loam, with a fourth part of decayed manure added, and some sharp sand. When potted they are plunged over the rims of the pots in a bed of cocoa-fibre in a frame. I find they are injured by wet in winter if

they are left fully exposed to the weather. *J. Douglas, Great Gearty.*

SALVIA AUREA.

A CORRESPONDENT has kindly given us the opportunity of seeing this desirable old plant (fig. 142), which we had long lost sight of. It is a native of the Cape of Good Hope, and was cultivated by Philip Miller at Chelsea in 1731, and figured in one of the early volumes of the *Botanical Magazine*, t. 182. Its glaucous leaves and relatively large bronzy-orange flowers are so striking, that we wonder such a fine plant should have been allowed to go out of cultivation. Table decoration and cut flowers have as much to answer for as "bedding out." It would form a fine plant for our friends on the Riviera, and we should even think that it might be tried with good chance of success in the Channel Islands, or in some favoured nook in Devonshire or Cornwall.

New Garden Plants.

GONIOSYPHA EUCOMOIDES, Baker.*

UP to the present time only a single specimen of this remarkable Liliaceous plant was known to exist, and now a living specimen of it has been sent to Kew by Mr. W. Bull, of Chelsea. It is a very interesting, and apparently an exceedingly rare or local plant, allied to *Tupistra*, and of rather striking appearance; the dense cylindrical flower-spike being crowned with a brush-like tuft of very narrow bracts after the manner of a *Eucomis*.

It has a short fleshy rootstock with fleshy roots, and a loose rosette of petiolate, elliptic, acute leaves, a foot long by 5-5½ inches broad, of a bright green colour. The terete green peduncle arises from the middle of the rosette of leaves, and is about 4-5 inches high, and bears a dense cylindrical flower-spike, 2½-3 inches long, by 1-1½ inch thick, crowned by a tuft of fine subulate bracts, 6-8 lines long, the flowers having similar bracts mingled with and protruding beyond them. Flowers dull dark green, fleshy, perfectly sessile, horizontal, campanulate, ½ inch long, and the same in diameter, the lobes of the perianth half as long as the tube, spreading, roundish, thickened and truncate at the tips with an inflexed apiculus, minutely eroseolate on the margins. Anthers sessile at the mouth of the tube, oblong, yellow. Ovary globose, light green, style projecting a little beyond the anthers, clavate and trigonous at the apex.

Mr. Bull does not know from whence he introduced the plant, but the original specimen was collected in Bhotan. So far as the leaves are concerned the plant has somewhat the habit of a *Funckia*. *N. E. Brown.*

STREPTOCALYX FÜRSTENBERGII, E. Morren, in "Belgique Horticole," 1833, p. 13. ECHMEA FÜRSTENBERGII, Morren and Wittm., in "Feld. Hort." 1879, p. 42, t. 2.

This is a very curious new Bromeliad, which Mr. Bull has introduced. It looks at first sight very like a *Pice-apple*, but, instead of an eatable syncarpium there is a dense oblong panicle, made up of innumerable horizontally distichous spikes of flowers, each spike subtended by a large pinkish serrulate bract. The genus stands at the head of the order in Bentham's classification, but, so far as I am aware,

* *Goniosypha eucomoides*, Baker, in *Journ. Linn. Soc. Bot.*, vol. xvi., p. 581, t. 19.

† *Streptocalyx Fürstenbergii*.—Acaulis; foliis 30-40 dense rosulatis lanceolatis rigidis arcuatis facie viridibus concavo dorso subulter lineatis, margine aculis parvis denticulatis cuspidatis armatis; floribus in specie horizontaliter distichis ascendentibus in paniculam amplam densam oblongam acutum ordinatis; spica singula bractea ovata subconcaeva subnulla albo furfuracea serrulata prædita; spicis inferioribus 6-8 floris; bracteis propriis parvis ovatis; ovario globoso viridi albo-furfuraceo; sepalis connatis lanceolatis adpressis apice mucronatis; petalis breviter protrusis; genitalibus inclusis.

this is the first time it has been seen in England alive. There are three other species known, all natives of Guiana or the Amazon valley. The present species was described and figured by Morren, from a plant that flowered in 1877 in the fine collection of Prince Fürstenberg, at his chateau of Donaueschingen in the Black Forest. It came from the province of Bahia, in Brazil.

Acaulescent. Leaves thirty to forty, arranged in a dense rosette, lanceolate, acute, rigid in texture, 2-2½ feet long, 1½ inch broad at the middle, ¾ inch at the dilated base, tapering gradually to the point, dull green and concave all down the face, finely vertically lineate on the back, armed on the edge with copious small decurved deltidoid cuspidate prickles. Inflorescence central, sessile, oblong, strobiliform, 15-16 inches long, 3-4 inches diameter; bracts imbricated, ovate, pink, rather horny, furfuraceous, serrulate, ascending, the lower 3-4 inches long, the upper an inch. Spikes horizontally distichous, the lower alternately six to eight flowered. Flower-bracts small, ovate. Calyx including ovary an inch long; ovary greenish, fleshy, one-third of an inch in diameter. Sepals pale, horny, adpressed, lanceolate, with an erecto-patent mucro. Petal limb small, only seen faded. Genitalia not protruded beyond the calyx. *J. G. Baker.*

THE CULTURE OF HARD-WOODED HEATHS.

THAT *Ericas* of the hard-wooded class are found to be delicate or difficult subjects to cultivate by beginners is a point that will be very generally admitted by all who know anything of their cultivation. They will not bear without resenting it the rough-and-ready treatment that plants of coarser organisation will endure unharmed. Their fine capillary roots and delicate constitution under cultivation in pots are admittedly very susceptible of adverse influences; but that they are the untractable subjects they are too generally believed to be by those who will not trouble themselves to understand their peculiarities and their cultural requirements we cannot admit. Although they undoubtedly constitute one of the most interesting, varied, and brilliantly beautiful classes of plants known to cultivation, they have never been taken to by gardeners generally with that amount of fervour and wide appreciation that their attractive colours and pretty forms would lead to the expectation of. They have not of late years been popular plants in the liberal sense of the word, and the reason of their unpopularity is that their management has always appeared to the majority of cultivators to be shrouded in mystery penetrable only to the few.

Since George III. was king, during whose reign British gardeners first made their acquaintance with Cape Heaths, down to the present day, the feeling of plant growers appears to have been that they were "uncanny" things, that only the wizards of the craft could hope to deal with successfully. And the wizards disposed to charm with them have always unfortunately been few, but never perhaps more so than now, if we may judge by the rarity with which well cultivated plants are met in the country. Good collections lying between Land's End and John o' Groat's may almost be counted on the fingers, and to so low an ebb has the demand for them shrunk, that the very small stock kept up in two or three of the London nurseries is sufficient to meet the requirements not only of this country, but much of that of the Continent as well. We are aware it is usual to ascribe this state of things to the influence of fashion at the present time, and are ready to admit that there is some force in the plea. The demands on glass and other resources of the garden were never greater than at present, and in many places it would probably be impossible to accommodate Heaths suitably. This fact may well account for the circumstance that they ever drew less attention at the present time than they engaged since their introduction to cultivation, but not for their unpopularity in times when hard-wooded plants were the most favoured of all classes with gardeners who laid claim to distinction in the art of plant growing. Fashion, no doubt, has something to do with the limitation of Heath growing at the present time, but the unreasoning prejudice that as a class they are very unmanageable does now and always have done more to circumscribe their cultivation than anything else.

What appears to be wanted to counteract this is an

increase, not of wizards, but of men who will carefully and patiently study the requirements of the plants for themselves. Without this they can never become more popular, indeed they are rather more likely to disappear from cultivation altogether. He who observes closely and comprehends clearly the lessons the plants themselves teach cannot fail in the culture of hard-wooded Heaths, provided he apply himself with the energy and painstaking the subject is worthy of.

Turning to practical details we shall first deal with the consideration of soil. The only suitable soil is peat, and it should be the best obtainable for the purpose; that which is hard, as if compressed and densely fibrous, with a deep hazel or chestnut tint, is the best, and if also possessing a good proportion of natural grit or sand it may be pronounced perfect. All these points of excellence may not be found in the peat of every district, but in these days of horti-

choosing the latter month in that case for the work. It is handy also when the collection embraces many plants of various sizes to classify them according to the several sizes, dealing with the largest first. By this means the bulk of the rougher parts of the soil will fall to the larger plants and leave the finer particles fitly to the smaller ones.

Never pot an Erica except it requires it. The test for this in young plants that are being grown on is that the pots shall be full of roots. If the soil of the last shift is only partially occupied with roots, and the soil be healthy, and the drainage in good working order, it is better to return such plants to their pots again and wait till they have filled up the soil with roots. If, on the other hand, the soil and drainage are unhealthy it would be proper in that case to break down the ball and repot in the same size of pot, or if found necessary even into a smaller size. Plants again that have reached specimen size, and are in

a perfectly thorough incorporation of the sand in mixing the roughly prepared compost will sooner or later bring about the same result in this case also. Thus, there will in either case be an undesirable increase of the liability to mishap without any compensatory advantage. On these grounds we prefer to break the compost moderately fine with the fingers, and refrain altogether from the use of the riddle except in potting very small plants as in the first and second shifts from the cutting pot. At the time of potting the compost should be moderately moist, rather dry than wet, and the ball of the plant should be in the same condition. A liberal admixture of sand of the cleanest and sharpest quality must be thoroughly well incorporated with the soil after it is broken up, when it is ready for use.

Small shifts in preference to large ones should be the rule in potting Heaths. Enough room to give pasture to the roots for a season will be found safer and altogether better than larger shifts. From half an inch to an inch all round added to the ball, according to its size, at any one shift, will be ample for the requirements of the most robust and progressive plant for a season. Let the drainage be liberal, using rough rather than finely broken crocks, and protect it with a layer of the roughest potting material, from which the fine particles have been removed by shaking well in a quarter-inch sieve.

We are now fully prepared for potting, in the process of which each plant, on being turned out of its pot, should be carefully examined with the view to ascertain the condition of its roots. If dry, return it to its pot to be sufficiently moistened; if much matted open up, and relieve the roots gently with a pointed stick, inflicting as little damage as possible in doing so.

Here it will be proper to caution beginners against the system advised by some Erica growers, of placing the ball in the process of potting so that its crown shall be on a level with the rim of the pot. This is a pernicious system that has caused the death of more Heaths than perhaps all other causes together. The object is to prevent the lodgment of water at the collar of the plant, which is not only desirable but necessary as a preventive of decay at that point, to which some varieties are more prone than others; but the cure invariably proves more fatal than the disorder. The elevation of the ball prevents the percolation of water through it, consequently only the sides get a sufficient supply, and if the roots at that point should perchance become dry, there being nothing to sustain life in the dried-up core of the ball, collapse is the inevitable result. Therefore avoid this practice by all means. It may be desirable to elevate the collar very slightly above the level of the surrounding portion of the ball, but it should never rise nearer the level of the rim of the pot than half an inch in the case of small plants, to 1½ inch in larger ones. A very slight decline from the centre to the circumference of the ball will be found quite sufficient if the drainage is as good as it should be to prevent the lodgment of moisture about the collar; but there must in any case be ample space left between the surface of the ball and the level of the rim to contain sufficient water to moisten the whole at any time. Having placed the ball as just described in the centre of the pot, proceed to fill in and ram the soil home equally and firmly around it till the space is filled up to the level of its outer edge. When finished, the surface of the new soil should be as impervious to the impression of the thumb as the old.

WATERING.

This is the most important of all operations in Erica growing; but it is most difficult to convey an intelligible idea of how, and when to do it in language to a beginner. It is an operation, the right performance of which can only be acquired by experience and close observation. The Heath grower must, of all cultivators, be acquainted with his plants collectively and individually—he must know their condition as to drainage and their behaviour under cloud and sunshine before he can water them aright. When he acquires this familiarity with their wants he will know at a glance, or by a rap of his knuckles on the pot of any doubtful individual what to do. We can only give general hints which will serve to indicate lines for the guidance of observation, but cannot impart or take the place of experience. After potting let the plants stand a few days without water, after which time they should be supplied with it copiously enough to moisten every particle of soil and every fibre of the

✻

FIG. 142.—SALVIA AUREA: FLOWERS BRONZY-YELLOW. (SEE P. 744.)

cultural soil-men there is no difficulty in procuring a quality that will suit the requirements of the most fastidious variety of Heath. If obtainable at home the collecting of it should be gone about with some care. The herbage or growth, whether it be Ling or other Heaths or Ferns, should be cleared off the surface before beginning to cut the turves; this done, the latter should be cut in convenient sizes as regards length and breadth, and from 2 to 3 inches thick, according to the depth and density of the fibre. Let it be cut only a month or two before it is required for use, as it is better to use it almost fresh than when much decayed. After cutting let it be stacked to protect it from being saturated with rain or snow.

POTTING.

This operation is best performed in February or March. If the collection of plants is large the most early to move in growth should be first dealt with, and the remainder in the order of their starting; but if small, they may be all done at the same time,

pots as large as are convenient to move about, will not often need potting. They may be kept in good health and vigour for many years in the same soil and pots by good management in other respects.

In giving directions for preparing the soil for potting it may be noted that there are some differences of opinion regarding the degree of fineness it should be reduced to in breaking up; some good Heath-growers believe it should be broken, not only very fine, but should be passed through a half-inch riddle after it is broken; others, who have been equally successful, go to the other extreme, and prepare their compost roughly, going the length of sifting the fine particles out if they bear too large a proportion in their estimation to the rougher particles. With regard to this it is only necessary to remark that in either case the difficulty of the subsequent management, especially as regards watering, is certain to be greatly increased. The fine compost will be very liable to become sodden especially in large pots; and the difficulty, or rather impossibility of obtaining

plant. Subsequent waterings must be regulated with great care and circumspection till the roots have taken full possession of the new soil. Over-watering would certainly result in the new soil becoming sour, and the death of the roots would ensue; under watering, on the other hand, would retard the progress of rooting by reason of drought—a lesser evil perhaps than the former if not too much prolonged, but in either case the loss of health and the loss of the season of growth would be in proportion to the duration and magnitude of the mismanagement. The watering of hard-wooded Heaths should be done by preference in the morning or early part of the day, especially throughout the colder months of the year. In summer pot-bound plants and even those that may not be so, will perhaps require water twice or oftener during the twenty-four hours. Much will depend on the local conditions of climate and other circumstances under which they grow, as well as on the state of the drainage of each individual plant, as to the frequency with which each will require water. If the surface of the ball of any particular plant is continually moist and water stands for some time after applying it there need be little doubt but that it is water-logged, defective drainage being the cause. Water should never be given twice to such a plant without correcting the fault in the drainage. If there is any doubt as to the requirements of a plant in respect of water the use of the knuckles already alluded to will settle the point at once. A rap sharply delivered on the side of a dry pot will call forth a light ringing sound, but if the ball is moist the sound will be heavy or dull. The best of all water for Heaths is that from the clouds. This should by every means be secured for them wherever the spring or other water on supply is impregnated with the salts of lime, iron, or any other pernicious ingredients.

GENERAL TREATMENT.

Little more remains to be said. Ericas being essentially plants of the sun should have the fullest exposure to light at all times, except the brief period during which they make their growth—they should then be lightly shaded during the brightest hours of the day. The house best adapted to their growth is one that is light and airy—span-roofed if possible—and in which they may be placed near the glass. As to placing them out-of-doors at any time in summer, that point must be decided by a consideration of the local atmosphere, as to whether it is pure, or loaded with the impurities of manufactories or city smoke. In the latter case they should on no account be put out-of-doors; in the former they may, but with doubtful benefit, especially in very moist localities where rain would interfere with the proper control of watering. Even in the best localities they will be under control if they are placed in cold pits in a good exposure, or in any temporary erection where they can be protected with glass at will. At all seasons they must have a free circulation of air, only shutting the ventilators during the prevalence of frost and cold cutting winds. It will be difficult during the spring months to do this, and at the same time to keep the temperature desirably low: the increasing power of the sun will, even in the teeth of a frost-laden March wind, raise the thermometer in a shut-up house to a degree much beyond what Ericas will endure for long. When this is frequently the case, scrim may be spread over the openings of the ventilators to temper the wind and deprive it of its frosty particles.

The temperature should be kept as low as is consistent with the exclusion of frost, but in long-continued dull damp weather in winter or spring it may be necessary to raise the temperature even when already undesirably high, in order to induce a free circulation of air, only shutting the ventilators during the prevalence of frost and cold, cutting winds. During the spring months the opening of the side ventilators is strictly to be avoided when frosty or cold east winds prevail, but the top ventilator may be kept open to moderate the temperature, which, in spite of a frost-laden March wind, the power of the sun at that season, will often raise higher than is desirable for Ericas. In long-continued dull damp weather, in winter or spring, it may be necessary to give a little fire-heat even when the thermometer stands undesirably high in order to induce a free circulation of air, by which means only can an attack of mildew be averted. When this course has to be adopted, it is best to give the heat during the day and open the ventilators freely.

Of the ordinary matters of pinching or pruning and staking it need only be said that the fewer the stakes that are used the better it will be for the health of the plants. Stopping or pinching will be necessary to keep the plants well furnished at all points, and as the direction of vigour in most sorts is upwards, to the detriment of the lower branches, the top shoots will require the largest amount of attention.

Mildew is almost the only enemy to which the Erica is a prey, but it will give little trouble if the plants are kept in health, free ventilation at all times, except during frost, being the best preventive, and the timely application of sulphur being the best cure. W. S.

ON THE WILD FORMS OF TUBEROUS SOLANUM.*

The well marked distinct species of tuber-bearing Solanum are five in number, and are all natives of America, viz:—

1. *Solanum tuberosum*, including numerous sub-species and varieties; 2. *S. Commersoni*; 3. *S. cardiophyllum*; 4. *S. Jamesii*; 5. *S. oxycarpum*.

The Potato of cultivation originated from the first. I will say a few words about the others and then return to this one, *S. tuberosum*.

2. *S. Commersoni* is a native of Uruguay, Buenos Ayres, and the Argentine territory, in rocky, arid situations at a low level. It is a dwarfier plant than *tuberosum*, with small, oblong, obtuse, subequal leaflets and larger flowers, with a corolla always pale lilac, and deeply cleft. It has been cultivated successfully in France, but is probably too subtropical in its climatic needs to be adapted for our own country.

3. *S. cardiophyllum* is more like some of the *tuberosum* forms in general habit, but the corolla is different in structure. It is a native of the highlands of Central Mexico at an elevation of 8000 to 9000 feet above the sea level. It was cultivated many years ago in the Chiswick Gardens, but is not in this country now, and no record seems to have been left about the shape, size and quality of its tubers.

4. *S. Jamesii* is a Northern type, being a native of the mountains of Colorado, New Mexico, and Arizona. It is very different from the cultivated Potato, in size and habit, much dwarfier, with oblong acute subequal leaflets and small pale flowers with a deeply cut corolla. It has been grown at Kew and many other places in England. The tubers are very palatable, but I have never seen them larger than marbles.

5. *S. oxycarpum*.—Of this I have never seen even dried specimens, and know it only from a drawing. It is like *Jamesii* in general habit, and differs very much from all the others in its fruit, which is oblong and sharp pointed, whence its name. It is a native of Central Mexico, and the flowers and tubers have never been described.

Tuberosum, using the name so as to include under it all the tuberous-rooted Solanums with short deltoid segments of the corolla, extends down the western side of the American continent, from the Rocky Mountains in latitude 30° north, to the Chonos Archipelago, off the coast of Patagonia, in latitude 45° south, so that it is spread over a latitudinal range of 75°. Within this area we get no less than sixteen forms, so far different from one another that they have been named by some one or other botanical writer as distinct species. They are not, however, species in any comprehensive sense. They all coincide in the general characters of tuber, leaf, inflorescence, flower and fruit; *tuberosum*, therefore, is one of those polymorphic vegetable types of which we have examples in the Old World in *Rosa canina*, *Rubus fruticosus*, *Narcissus Pseudo-Narcissus*, and *Nephridium Filix-mas*. The case is very similar to what we have in England in the genus *Rubus*. *Chamaemorus*, *Idæus*, and *saxatilis* are well marked, definitely bounded, and clearly characterised types. In the tuberous Solanums, *Commersoni*, *cardiophyllum*, *Jamesii*, and *oxycarpum* are the distinct types, and *tuberosum*, like *Rubus fruticosus*, a comprehensive species in the sense of Bentham and Hooker, a group of closely allied species in the sense of Dunal and Babinet. The extreme forms look very different from one another when they are placed side

by side, but if the whole series is taken there is no very decided gap to be found in any one character, but between the extreme types we get gradual intermediate stages of gradation. In the present case the principal differences between the sixteen forms lie in the robustness of growth and hairiness of the whole plant, the shape and number of the leaflets, the absence or presence of little leaflets intercalated on the leaf axis between the big ones; the shape of the calyx and segments, and the colour of the corolla. Although the Potato has been cultivated in Europe for 300 years, in point of fact we know extremely little that is trustworthy about the alterations that may be produced in these characters by change of climate and soil. On the present occasion I will enumerate them geographically, referring those interested in the matter for botanical details to a paper which I published in vol. xx. of the *Journal of the Linnean Society*, p. 489 to 507, with six plates.

CHILILI.

The Chilili types are *Maglia*, *euberosum*, *Bridgesii*, and *Fernandezianum*. We have had *Maglia* at Kew since 1862. It differs from *euberosum* by its fewer leaflets, intercalated little leaflets absent or scarcely present, hispid peduncle, and white flowers. It is abundant on the coast, near Valparaiso. A closely allied form was found by Darwin in the Chonos Archipelago. *Euberosum* is very little different from the cultivated Potato in leaf and flower. When it was first described it was said to have no tubers at all, but in a plant I saw last summer, grown at the Edinburgh Botanic Garden under the name, tubers were present. *Fernandezianum* comes from the island of Juan Fernandez. It looks very like the ordinary cultivated Potato. *Bridgesii* is a high Andine form with numerous narrow leaflets and obtuse calyx segments.

ANDES OF PERU, ECUADOR, BOLIVIA, AND COLUMBIA.

In Peru a plant is widely spread which quite agrees with the common cultivated Potato. This I will therefore call *eu-tuberosum*, as I think it best to keep the name *tuberosum* for the whole group, and have a separate name for each of the distinguishable forms. The drawing of it which I now exhibit was made from a plant gathered by Matthews on the rocky hills of Amancases near Lima. Whether this *eu-tuberosum* is really native in Peru I am not able to say with certainty, but I should think this is most likely. The other named Andine forms are *Mandini*, *immiticolumbianum*, and *valencuelae*, none of which have been seen alive in Europe.

MEXICO.

The Mexican types are *verrucosum*, *suaevolens*, *stoloniferum*, *demissum*, *utile* and *squamulosum*. Of *verrucosum* I exhibit a figure copied from one of Schlechtendahl drawn from a living plant grown in Germany. This *verrucosum* was cultivated for several years on a large scale near Geneva, but was not able to compete with *eu-tuberosum*, and was abandoned. *Suaevolens* was once grown at Kew, but we have not got it now. *Demissum* was described by Lindley from specimens grown at Chiswick. Of *stoloniferum* I have seen plants grown at Leipsic. *Squamulosum* and *utile* I know from descriptions alone.

ROCKY MOUNTAINS.

Here we get *Fendleri*, the most northern of the tuberous varieties. It is much dwarfier and weaker than *euberosum*, with three to seven thin ovate sub-acute leaflets, intercalated leaflets few or none, and few-flowered cymes (as shown in an accompanying figure). What is the economic value of its tubers still remains to be tested.

I take the names as I find them in the botanical books. I do not mean to say that I can undertake to identify sixteen sub-species and varieties. Taking *eu-tuberosum* as the type, *Maglia* and *Fendleri*, the two geographical extremes, look to me to recede from it most. All that I know about their characters and localities I have given in the paper to which I have already referred. I wish much that some one would monograph these tuberous Solanums in the same thorough way that Mr. George Maw has just monographed the *Crocuses*. We do not even know clearly whether *eu-tuberosum*, the common cultivated esculent so freely displayed on the tables in front of us, be really an original type, or a form produced by the agency of man; and in investigating the relations to it of the other fifteen tuberous forms, there is scope for the labour of a lifetime. I leave to those who are better qualified than myself the task of thinking out what are the practical deductions to be drawn from these facts.

* A paper read at the Tercentenary Conference, December 2, 1886, by J. G. Baker, F.R.S.

Orchid Notes and Gleanings.

MASDEVALLIA CUCULLATA.

WHETHER destined to become popular or not, for garden purposes this is very distinct and good. It has not the clear, brilliant colouring of *M. Veitchi*, or *M. Harryana*, but is equally desirable in a collection where variety is of any importance. *M. cucullata* and *M. inflata* are said to be its nearest cousins, but its habit and general appearance are not unlike those of *M. Reichenbachiana* and *M. coriacea*, which are comparatively better known in the horticultural world. The colour, however, is described by Reichenbach in the *Gardeners' Chronicle*, vol. xix., n.s., p. 592, as of the darkest blackish-purple, is seldom (if ever) met with in the genus. In our sunless, foggy English winter climate its greatest intensity may not be developed, and some would prefer to consider the colour as a deep maroon. The foliage is leathery and handsome, forming a fine glossy green background for the conspicuous and moderately-sized flowers, whose spreading tails are $\frac{1}{2}$ —2 inches in length. Being a native of Colombia, it delights in the temperature of a cool house, and may be grown to perfection in pots with peat and sphagnum, and plenty of drainage to carry off the superabundant moisture necessitated in the heavy waterings during the summer season. A healthy specimen has been flowering for some time in the cool O'chid-house at Kew, hung up near the glass. *J. F.*

LISSOCILIUS KREBSII PURPURATUS.

A deciduous terrestrial Orchid, native of South Africa, with pseudobulbs and plicate leaves. The flowers are borne in erect spikes, each bearing some twenty flowers. Sepals dark green at the back, maroon-purple in front, the margins revolute; the petals ovate, bright yellow outside and creamy-yellow within, faintly veined with red at the base; lip clear yellow, its lateral lobes chocolate-brown streaked with darker lines, and the spur is striped with pink. The plant flowers in July.

Pot culture, with good fibrous loam and abundance of water during the growing season. They should be kept dry during the resting season and require a warm temperature at all times especially during growth. The plants are best grown in full light. *Orchid Album.*

THE POTATO TERCENTENARY: THE CONFERENCE.

(Continued from p. 723.)

We have already alluded to the proceedings up to the time of our going to press on Thursday, Dec. 2, in the afternoon of that day Mr. G. Murray, F.L.S., of the British Museum, read a paper on "The Potato Disease," his remarks being illustrated by a number of diagrams of the fungus in its various stages. He said that the history of the disease was a recent one as compared with the history of the Potato itself, notice having been first called to it in 1845, when it was probably brought to the country from Belgium. After describing the nature of the fungus, Mr. Murray said that he had satisfied himself that the disease was propagated by the spores being distributed by the wind. A number of glass slides, such as are used with a microscope, having been covered with glycerine and placed on the lee side of a field of infected Potatoes, when a slight breeze was blowing, it was found that after an exposure of a few hours the slides each contained a number of these spores. From continuous microscopic investigation it had been seen that the complete fungus was produced in three hours; and this fact accounted for the sudden and disastrous spread of the disease. No system of earthing up the Potatoes could, he believed, be efficacious in checking the disease, neither could confidence be placed in any legislative enactments regulating the planting of Potatoes.

Earl Cathcart said it would be interesting to know whether the Potato disease was an effect or a cause. With regard to the degeneracy of the Potato, he might mention that it was a fact that no supposed disease-resisting Potato had ever existed for more than about twenty years. That, in itself, he considered to be an argument in favour of the theory that plants are liable to degenerate when over-cultivated.

INTRODUCTION OF THE POTATO INTO FRANCE.

Mr. Henry Leveque de Vilmorin (of the French National Society of Agriculture) then read a paper upon "The Introduction of the Potato into France."

The second day's proceedings, if of less general interest than those of the previous day, were decidedly more practical, but the audience, though fit, was decidedly few.

THE PRODUCTION OF VARIETIES BY CULTIVATION.

Dr. Maxwell Masters, F.R.S., having prepared no paper, introduced this subject for discussion by a few general remarks.

After alluding to the objects sought, the speaker said that the question for discussion was whether the modes which we now adopted for the purpose of obtaining new varieties were sufficient to insure the attainment of the object worked for. On the whole he did not think they were, and he would take the opportunity of drawing attention to the want of precision that attended the efforts at the present time to raise new varieties of the Potato. A wider knowledge and a greater precision in scientific method were much wanted. As an indication of the present deficiency, the speaker alluded to the popular confusion between "seeds" and "tubers," and to the singular habit of speaking of the fruit or berry of a Potato, either as an "Apple" or a "Plum," when it was neither one nor the other, and presented but a remote resemblance to either! Dr. Masters then alluded to the possible methods of securing new and improved varieties, speaking first of selection either of tubers or of seedling varieties, but he was of opinion that nothing useful could be derived from this method. Another process was that of cross breeding, or the production of new varieties by the application of the pollen of one variety to the stigma of another. This method had been practised for many years, especially by Mr. Fenn. The third method was that of hybridization proper, or the crossing of two reputedly distinct species. This process had not been much attended to in England until it was taken up by Messrs. Sutton at Reading. There was yet another mode by which new varieties might be obtained—namely, grafting. Many Potato cultivators absolutely denied the possibility of anything like grafting, but he believed it to be a practicable and realizable idea. He had himself ascertained that it was possible, and had seen or read of the results obtained by Mr. A. Dean, Mr. Maule, Mr. Fenn, Mr. W. G. Smith, and other experimenters. Remarkable results had been obtained by grafting the Potato on to the Tomato and other species, but these were matters of curiosity merely. These were all the methods at present practised for gaining new varieties of the Potato; there might be more, but he did not think it probable. What he would wish to emphasise was that all these modes, except that practised by Messrs. Sutton, were merely shifts of a kaleidoscope, or ringing the changes on the old varieties over and over again. If any really important result were to be obtained in the future in point of greater adaptability to our climate, power of resisting disease, or general robustness, we should have to infuse a new strain into our varieties, and the only way to do this was by hybridization of species. It was not necessary to confine the experiments to tuberosus *Solanums* only, but other hardy species of *Solanum* might be put under requisition to supply *Solanum* supply seed, as the case might be. The pollen, however, would be very long and tedious, and it would hardly be within the power of private individuals to undertake the experiments, which would require perhaps twenty years of constant attention.

Mr. A. Dean, who was announced to read a paper on the "Raising of New Varieties," criticised some of the statements made by Dr. Masters, especially as regards the production of varieties by selection, in which position he was supported by Mr. Arthur Sutton, but both these gentlemen were probably at the moment alluding to selection by tubers only, and the moment alluding to selection by seedlings. Mr. A. Dean had furnished us with the following note, which embodies the substance of his paper and the gist of his remarks:—

VARIATIONS IN POTATOS BY CULTIVATION.

The very interesting address delivered by Dr. Masters before the Potato Tercentenary Conference on the 3d inst., was based upon some notes which are

now before me, and upon which I wish to comment.

It was much to be deplored that papers and discussions so full of interest both to scientific and practical men should have had so poor an audience, for those who were absent were emphatically the losers. Now, Dr. Masters suggested that some variations in Potatoes were produced by selection, subsequently supporting his assertion by the unfortunately too well known fact, that some seed or Potato growers do not hesitate to publish sorts as improved forms of well-known varieties. That such improvements can be effected by selection [of tubers] so as to justify any such appellation as "improved" or other endeavour to show distinctness, is improbable, if not impossible. No Potato can, by any process of selection, be made better than it was when originally named, and in its pristine youth and vigour. A stock may deteriorate through bad culture, and, no doubt, does so often, or through bad storing, or through careless regard for the commonest requirements of a Potato depending for perpetuation upon tubers.

On the other hand, we have ample evidence that varieties will endure for long periods if carefully selected, cultivated, and preserved. The old Ashleaf—so old that its origin is hardly traceable—is a proof that with ordinary care any variety may be long perpetuated. The reason why the Ashleaf has been kept so long is, that we have not yet found a kind of its peculiar quality, and so early, to displace it; still it is now much less grown than was formerly the case. One reason why so many other forms have disappeared is, that we can easily raise, by cross-breeding, new varieties, which are even better croppers, equal or even better in quality, and, being new, invariably do what is done everywhere—push the older forms out of existence.

Sports, or bud variation, form a second suggestion, which, however, does not seem applicable to the Potato—at least, as far as my considerable experience has gone. One result, I trust, of the reference to these matters by Dr. Masters will be that we shall hear no more of undoubted impositions which have been found under the designation of improved varieties as applied to Potatoes.

Cross-breeding undoubtedly forms the chief, indeed the only means by which new varieties are obtained. The practice is simple, and so easy that we have numerous raisers of Potatoes by cross-breeding. Some kinds set their own flowers most abundantly, but that is due solely to a superabundance of pollen in the anthers. Others—and these are numerous—have very robust habit, but scarcely any pollen, hence it is difficult to employ them as pollen parents but most will make very good seed parents. On the other hand, when pollen can be obtained from them if ever so sparingly, it will fertilise as readily as will pollen from the most fecund sorts. Dr. Masters pointed out that the common appellations of Plum or Apple to the seed-ball of the Potato were botanically misleading; it will interest not only all Potato breeders but all interested in the Potato in any way, to learn that a more correct appellation would be berry. Some few kinds produce those berries in great profusion—Kadstock Beauty and Woodstock Kidney have often given clusters of twenty or more, and literally by bushfuls.

The seed produce of these would, without doubt, being naturally fertilised, prove but reproductive of the parent [?]. It is only when actual cross-fertilisation takes place that variation is found and then often it is most remarkable, even two coloured sorts producing white ones. The application of other pollen to the pistil of the flower of the seed parent will produce a berry having probably some fifty seeds, and each one shall give a plant almost certainly diverse from its fellow in some way. What wonder, then, that we have so many new varieties of Potatoes and that older kinds get elbowed out of existence? Probably most Potato cultivators have noticed that whilst many varieties promise to bloom freely yet they fail in the promise, the blooms falling ere fully developed. There can be little doubt that such result is the corollary of want of pollen, in the flowers, because it is often found that application of pollen to flowers before they fall will not only retain the flowers, but cause seed-berries to form. It is rare, however, that such berries come so large as is seen on plants which naturally fertilise their own blooms. I have often had to gather berries so produced when apparently only half matured, and have invariably found the seeds fertile. Growers regard free berrying

to be objectionable, as tending to abstract from the plants strength which otherwise would go into the tubers. It is worthy of remark that, although I have had breadths of kinds which naturally fruit freely to leave considerable quantities of berries containing seed on the soil, yet I have never at any subsequent season found seedlings to germinate. The obvious thought is that cold or damp kills the seed—not an improbable result in the case of so tender an exotic as the Potato is.

With respect to hybridisation proper, between two species or progeny of species, I can but agree with Dr. Masters in the conclusion that it is work for some public body to take in hand. Without doubt the experiments so admirably conducted by the Messrs. Sutton at Reading, whilst full of interest and even of promise, will lack the importance which would attach to the actual hybridisation of two distinct species, or even of progeny of species. To employ pollen of a cultivated form upon the original tuberosum is at once a great leap, and yet but travelling over the old ground; and if the disease is to be checkmated there does not seem much hope of such an accomplishment by elements notoriously liable to disease. But to intercross the original *S. tuberosum* with *S. Maglia*, or the latter with some other species, would be to make a really new departure, although it may take fifty years to solve effectually, and even then perhaps end in failure.

It is true we never had more prolific Potatos than now, nor have Potatos been more abundant for many years; still, we have been revelling in a succession of comparatively good Potato seasons, and that makes us optimistic—*à la*, rather than despondent. With wet seasons—and seasons seem to run in cycles—we may have a return of the old evidences of devastation. Should such misfortune come, where shall we look for relief—to what straw shall we cling for help? If a new departure in the creation of Potatos will not help us, what will? And if that departure is not really promoted, what hope is there in that quarter? Even the proposed introduction of varieties said to be void of disease in Chili to this often cold and inhospitable climate, in which the *Petersonspora* spore seems exceptionally favoured, can hardly help in the solution of the problem.

I should like to add, in conclusion, that the recent Conference, poorly as it was attended, served to show how much of interest there is found clustering about the Potato, apart from its mere value as an article of food. Without doubt, its exceeding liability to disease has helped to bring these features into prominence, and it must be admitted that Potato culture in all its varied aspects may become a fascinating occupation and study.

Mr. Arthur Sutton (Reading) said that he did not wish to claim any of the credit for having originated the experiments referred to by Dr. Maxwell Masters. The idea had emanated from Lord Cathcart, and he believed that in its execution they had a pleasing example of the union of scientific and practical knowledge.

Mr. William Earley said that, while he did not assert the possibility of obtaining new varieties by the process of selection, the fact was not to be overlooked that by continually choosing the best specimens of a variety a better standard of excellence was maintained.

Mr. Charles Ap Thomas said that he had resided for twenty-five years in Chili and Peru, and was conversant with the Potatos grown there. There were three principal varieties of the Potato, one of them, the yellow Potato, *Papa amarilla*, cultivated up to 2000 or 3000 feet, near Callao, and very suitable for introduction into England. [The Incas of Peru cultivated a similar variety, as was mentioned the day before in Mr. Markham's paper.] Its name was given it on account of the colour of its flesh; and it was very similar to the Rector of Woodstock variety. It was indigenous to the soil, and had been found in the country by the Spaniards when they first arrived. Other varieties grew near the coast. Mr. Ap Thomas suggested that these varieties should be introduced, and alluded also to the *Ullucus*. He had never heard of the existence of the disease in Peru.

Earl Cathcart expressed a hope that Mr. Ap Thomas' information might be put into a form available for future reference.

Papers were then read by Mr. Richard Dean, on "The Cultivation of the Potato;" by Mr. Alexander Dean, on "Raising New Varieties;" and by Mr.

Earley, on "The Advantage of Early Lifting of the Crop as a Preventive of Disease."

RAILWAY RATES.

In the evening a conference was held of Potato cultivators to consider the subject of the rates of transit of Potatos. Mr. T. H. Bolton occupied the chair. In opening the proceedings he said that it was generally admitted that the railways had hardly answered the requirements of the public either as to accommodation or cheapness of transit. In the last Parliament a measure had been introduced, on the responsibility of Mr. Gladstone's Government, to place the railway companies under greater supervision, and to require that they should more fully discharge the duties which had, under Parliamentary sanction, been intrusted to them. The measure was not then carried through, but its passing into law was only deferred, and the railway companies would have finally to submit to Parliamentary control. We had had very great reason to complain of the unfair preference that was practically given to foreign producers in connection with the main trunk lines in the great cities. It was no use for the railways to plead that they could not afford to satisfy the demands of the public, for it could be seen from many returns that most of the chief lines were paying good dividends.

Mr. W. A. Hunter, M.P., then read a paper on the subject under discussion. He said the subject of railway charges for the carrying of Potatos might be considered under the following heads:—1, Preferential charges in favour of foreign as against home-grown Potatos; 2, irregularities in the charges compared with the service rendered; 3, charges by railway companies exceeding the maximum; 4, excessive proportion of the charges to the value of the article; 5, suggestions for cheapening the rates for conveyance. With regard to the last consideration, could cheaper rates be obtained? It was first to be remembered that as it stood now the law could do nothing to help the Potato grower. On the Brighton line the rate charged per ton per mile, exclusive of collection and delivery, varied between *4d.* and *6d.*, while in America the Pennsylvania Railroad Company charged less than a halfpenny per ton per mile on the average of the whole goods traffic. This was lower than the English average for the coal traffic only. The secret of the low American rates was not in the unremunerative character of the work done, but in the mode of conducting railway business. What was required was a truck rate besides a tonnage rate. By such an arrangement the trader could have the option of sending by the present system or of having a truck and loading it as he pleased and with what he pleased up to the full carrying capacity of the wagon. At a rough guess he would say that an eight or ten ton truck ought to be charged about *6d.* per mile for short distances (say under 40 miles), and a diminishing rate for long distances, so that for 200 miles it ought not to exceed *4d.* per mile. It might be said that though this system would be beneficial to the large trader it would not be so to the small trader. Indirectly it would, however, for the moment a fair truck rate was established a class of carriers would spring up who would collect the traffic of small men and make their profit by sending full truckloads. Under the present system the independent carrier has been exterminated and the railway companies had established a monopoly; if a truck rate were fixed the business would be made more profitable to the companies and at the same time the railway monopoly would be destroyed.

After a discussion upon the paper the Conference closed with a vote of thanks to Mr. Hunter and Mr. Bolton.

IMPLEMENTS FROM IRELAND USED BY THE PEASANTS.

On the stand of Messrs. Hooper & Co., of Covent Garden, were shown some very interesting *souvenirs* of Sir Walter Raleigh's house in Ireland, sent by Mr. J. C. Buckley, of Savoy House, London. Amongst them were the following:—Potatos grown in the garden of Raleigh's house at Youghal, Co. Cork, where the famous traveller first planted the Potato in these islands; these Potatos were contained in an osier "kish," or basket used to collect the tubers in the field (see fig. 145). A curious spade used for planting and digging Potatos in the Co. Cork as well as Waterford; this implement is prehistoric in make, its metal portion being fitted in the handle exactly in the same manner as the Reth bronze hatchets were attached to their handles (see

fig. 144). A drinking vessel of Beech-wood, called a "peggin," used in drinking buttermilk with their Potatos by the peasantry. A three-legged iron pot, with its pointed "hangers" used for boiling the "praties;" (see fig. 143). This pot (as well as the "peggin") is of antique form, being exactly similar to Irish bronze pots found in the bogs, said to be over 2000 years old. Some branches of Yew, taken off Yew trees of great age and size, which grow over the spot where Raleigh and Spenser the poet often met, by the borders of "Awnegduff" on the Blackwater, whilst Spenser was writing his *Fairie Queen*. A photograph of Raleigh's house at Youghal, Co. Cork. In this view was shown the "oriel" window whence many of Raleigh's letters are addressed ("From my Oriel in Yochel"). The room to which this window belongs is a most interesting apartment; it is wainscoted with dark Irish Oak, and has a beautifully carved chimney-piece of Elizabethan design, as well as tables and chairs of the same style, all belonging to Raleigh's time. Amongst other articles herein are leather drinking vessels, or "Black Jacks," said to have been used on the famous occasion of Sir Walter's smoking being seen by his Irish servants. The house is kept in excellent preservation, and is quite a museum of Elizabethan antiquities and reminiscences of Raleigh. It is now the property of Sir John Pope Hennessey, who has shown the greatest taste and care in all that regards this ancient abode.

Besides these *souvenirs*, Mr. Buckley also showed some of the staple food of the peasantry, consisting of Potatos, herrings, salt, and buttermilk, a simple diet, which, unfortunately, was not always to be procured.

THE ALPINE GARDEN.

CORIS MONSPELIENSIS.

The older authors or writers recorded this shrublike, bushy herb as a greenhouse biennial. Certainly the habit and general appearance of the plant would never suggest such an idea. The derivation of the generic name, adopted from Dioscorides, is also a stumbling-block, and having no apparent application here. The figure in the *Botanical Magazine*, 2131, has been taken from a pot-grown plant, where the branches were hanging over the sides of the pot, giving a false impression of the plant being procumbent in habit. Subsequent writers have employed the same figure to illustrate their description, thus propagating the error, and, as it were, arguing in a circle. When planted as it should be, in a dry, sheltered place, with full exposure, it forms a densely branching, upright little bush, fittingly clothed with small, linear leaves, revolute at the margin, and closely resembling a Heath, especially when seen in flower a short way off. Its habitat in Southern Europe—in barren sandy soils in maritime localities—should be a good indication of the treatment most suitable to it in our moist island climate, especially in winter. The bright lilac flowers are irregular, and produced in dense elongated heads all through the summer, even into November, when the weather is open, as it has been this autumn. Dry crevices should be selected for it on the rocky, with a little shelter if possible. It presents a striking contrast to *Hottonia palustris*, another member of the Primula family, and forcibly illustrates the effect of long-continued environment. Propagation is effected by seeds sown as soon as ripe.

GEUM MONTANUM.

Like *G. coccineum*, this species is a constant bloomer while summer and autumn offer favourable conditions. The neat pinnated leaves and short flower-stems, together with the large yellow flowers, give it at all times a refined appearance, and it in no way belies its specific name as an alpine plant. There is an uncoloured figure of the species in Jacquin's *Flora Austriaca*, iv., 373, which although otherwise faultless, gives but a faint impression of its real value for rockwork purposes. The largest leaves are those that spring from the base of the plant and carpet the ground, with a large terminal subcircular leaflet and several smaller ones, gradually getting less towards the base. The stem leaves are decidedly smaller and trifid or undivided, resembling bracts where they support the terminal solitary flower. This species is synonymous with *Sieversia montana*. The latter genus is now merged in *Geum*, and differed originally in generally possessing an unjointed awn to

the fruit. *G. pyrenaicum*, if not identical with the above, would seem to be a closely allied species with interruptedly pinnate radical leaves and a short stem terminated by one to four nodding yellow flowers. It is figured in Lamarck's *Planches de Botanique*, iii., 443, and comes from the Pyrenees. Both are readily propagated by cuttings of the rootstock which do not increase very rapidly, at least in the case of *G. montanum*. Any good garden soil will grow them to perfection, but they give most satisfaction if planted in a moderately rich soil, on a well exposed part of the rockery.

HOW TO SOW SEEDS OF ALPINE PLANTS.

The society which was instrumental in founding our garden has in view the protection of the alpine flora against the acts of vandalism to which it is exposed, and to make the amateur public understand that the best way of introducing alpine flowers into their gardens is by means of seeds. For this purpose we raise plants in our garden from seed, and offer them to the public at a price which will cause them to give up their destructive habit and cause them to prefer the plants raised by us to those transplanted from their native spots, and of which the greater part either do not recover or grow badly.

Our seeds are collected for this year; they may be sown at once or kept back till spring. By sowing them towards the end of November time is gained, as they stratify during winter and germinate at the first signs of spring. In this case they should be sown in pots on soil on a very mild hotbed and but slightly watered. If it is desired to wait till spring the seed should be sown as early as possible in March or April, in the open ground, and in a light, porous, and permeable soil. What is to be particularly avoided is a heavy, wet soil; but on the other hand it must not be so light or sandy as to dry up too easily. If by adding sphagnum (sifted) it can be made spongy, it would be better for delicate species. The presence of this sphagnum in the soil maintains it at a more equal condition of moisture.

The compost which we employ is composed of one-third peaty soil, one-third leaf-mould, and one-third sand and sphagnum. For species requiring dryness we replace the sand by coke-dust. It is an advantage to drain the pots or beds by placing at the bottom a little coke, in order to keep out worms and woodlice. Regular light waterings should be given. When the seeds have germinated the young plants are pricked off into pots or pans. *H. Corveion*, Directeur du Jardin Alpin d'Acclimatation, 2, Chemin Daucet, Genève.

EFFECTS OF TOBACCO ON LAND.

As the above-mentioned subject, especially taken in connection with the experiments in Tobacco culture in this country, is likely to attract public attention, perhaps you will be kind enough to allow me to say a few words as well as Mr. Boynton.

Now, as an "Old Virginian," my experience is just the very contrary of Mr. Boynton's. Tobacco takes the place in Virginia of Maogels in our four-course system, and I may say that the system adopted by the best farmers in Virginia is exactly that of our four-course rotation. If you were to tell a Virginian farmer that Tobacco "piens the land," he would be too polite to call you a fool or to laugh in your face, but he would "calculate, stranger," that you knew but darned little of what you were talking about. Now, Tobacco has been grown for a hundred years or more in Virginia, and, contrary to Mr. Boynton's notion of its poisoning or exhausting the soil, it is regarded as the best preparation for a cereal crop, such as Wheat or Oats. Corn, *i.e.*, Maize, should never succeed Tobacco, and I should judge Mr. Boynton's neighbour is a novice at Tobacco farming, or he would not have followed Tobacco with that crop, and I am not surprised at his not getting his big crop of corn on that acre, but should have been much surprised if he had.

The rotation found to answer best in Virginia is as follows:—

- Maize, manured (farmyard manure).
- Oats.
- Tobacco, manured (farmyard and artificial).
- Wheat.
- Clover, top-dressed with gypsum.
- Wheat.
- Tobacco, manured (artificial and farmyard).
- Oats.

And under this system the lands in Virginia are improving.

Tobacco is not nearly so exhausting as some people try to make out, and I would ask any one to think the matter over carefully in his own mind and make comparison for himself before being led away by the foolish and unthinking remarks of those who know

FIG. 143.—IRISH POT: A SURVIVAL. (SEE P. 748.)

little or nothing of the subject. A fair average crop of Tobacco in Virginia is about 1000 lb. per acre (this is rather over than under the average). I believe, from experience in Norfolk and Kent, this year, that we can grow rather more in this country than in Virginia, and put it at 1200 lb. per acre—say, rather more than half a ton of cured Tobacco. Now, this would weigh in its green state, say, at a rough

FIG. 144.—IRISH STUD, FOR POTATO CULTURE: MUCH REPEATED. (SEE P. 748.)

guess, 5 tons; and compare it with a crop of Mangels of, say, 39 tons—and I know of a crop of 60 tons in this parish this year—and see which takes the most out of the land. "Yes," you will say, "but you sell your crop of Tobacco all off the land, and we consume our Mangels." Right you are, my friend, but do you not sell milk, beef, and mutton, &c.?—and as you will say, "Yes, but we buy in artificial foods, as

FIG. 145.—"KINK," OR POTATO-BASKET. (SEE P. 748.)

oil-cakes, &c., to make up the deficiency." Now, buying oil-cakes and other feeding-stuffs is only another way of buying artificial manures; and so, as far as Tobacco growing is concerned we are quits on that score; and surely in the present depressed state of agriculture in this country the introduction of some crop that will sell at a profit greater than that now made by Wheat, Barley, beef, or mutton, and what is more, will keep the money we now have to pay for the 50,000,000 lb. of Tobacco we annually purchase

in this country, will do some good, or at least deserve the kindly support and encouragement of all interested in the welfare of the English farmer and agricultural labourer, instead of having cold water thrown upon it.

I think that the thanks of the British public are due to Lord Harris and those noblemen and gentlemen who have so kindly and generously supported him by carrying out expensive experiments in the public interest, and I am very pleased indeed to find that so far Tobacco culture is a great success in this country. I had the pleasure of taking to London the other day, and having cut up into fine smoking Tobacco, the first 10 lb. of English grown Tobacco, and I may tell you that the manufacturers were agreeably surprised at the size and quality of the leaves, and the cleanness and brightness of the cut sample, which was exhibited at the cattle show on the stand of Messrs. James Carter & Co., the growers. Further on, if you would like, I will send you a few lines on the cost of growing, &c. *John C. Wallis*. [Please do so. Ed.]

NEW PLANTS CERTIFICATED

BY THE ROYAL HORTICULTURAL SOCIETY DURING THE LAST HALF-YEAR OF 1886.

The following plants received First-class Certificates, except those marked B.C., to which Botanical Certificates of equal rank were awarded.

Adiantum Capillus-Veneris imbricatum	G. Masters, Oct. 12.
" cuneatum, Phillips' var.	Phillips, Aug. 10.
Amaryllis Lady Mayoress	Jas. Veitch & Sons, Nov. 9.
Anagrostis viviparula	Sir Trevor Lawrence, Nov. 9.
" cauliculata	Baron F. de Rothschild, Oct. 12.
Aphelandra chrysois	W. Bull, July 13.
Araucaria excelsa Vervatiana	B. S. Williams, July 1.
Asplenium marianum plimmsum	" Backhouse & Son, July 1.
Aster Dark Scarlet	Henry, Aug. 10.
Begonia Imperial	R. Owen, Aug. 10.
" Mrs. Plunket	Cannell & Sons, Oct. 12.
" Paul de Vieux	" "
Bignonia Chambrayana	C. R. S. Dickens, Oct. 26.
Carnation Terra Cotta	J. Douglas, July 27.
Cattleya Eldorado var. virginalis	H. M. Pullett, Oct. 26.
" gigas, Hill's var.	C. G. Hill, July 27.
Cespedesia discolor	W. Bull, Sept. 21.
Chrysanthemum (decorative)	
Adm. Sir T. Symonds	Cannell & Sons, Nov. 9.
" Buttercup	Jas. Veitch & Sons, Oct. 26.
" Carew Underwood	G. Stevens, Dec. 7.
" Coquette de Castille	W. Holmes, Nov. 9.
" Eyesford Gem	Cannell & Sons, Nov. 9.
" Fleur-deu Tom	R. Owen, Oct. 26.
" La France	Cannell & Sons, Nov. 9.
" Leucanthemum var. Puy de Dôme	Cannell & Sons, Nov. 9.
" Madame E. Dordan	Backhouse & Son, July 1
"	Cannell & Sons, Oct. 26.
"	J. Davis, Oct. 26.
"	J. Laing & Co., Oct. 26.
"	R. Owen, Oct. 26.
"	Miles, Aug. 10.
"	Stevens, Oct. 12.
"	E. Marzin, Dec. 7.
"	Jas. Veitch & Sons, Nov. 9.
"	Jas. Veitch & Sons, Nov. 9.
"	G. Stevens, Oct. 26.
"	W. G. Heald, Nov. 9.
"	Jas. Veitch & Sons, Sept. 21.
"	Jas. Veitch & Sons, Oct. 26.
"	Stevens, Oct. 12.
"	R. P. Ker & Sons, July 1.
"	R. P. Ker & Sons, July 1.
"	W. Bull, Dec. 7.
"	Jas. Veitch & Sons, Sept. 21.
"	Sir T. Lawrence, Sept. 21.
"	Cannell & Sons, Oct. 12.
"	Cannell & Sons, Sept. 7.

Seculing A 1 Harris, Sept. 2.

The following were given at Chiswick, and were omitted in our last list of Certificated Plants:
Potato Favourite Jas. Veitch & Sons, March 30.
King of Russets Lye, March 30.
Bennet's Surprise Bennett, March 30.

The Herbaceous Border.

IMPATIENS FULVA.

EXOTIC plants more seldom get naturalised in this country than our weeds do in other countries, where the climate is favourable to their well-being; but strangers in this country are always of interest to the botanist, and more or less so to the horticulturist when the plants are of an ornamental character. Botanists are divided in their opinions as to whether the present species or *I. Noli-me-tangere* has the most right to be looked upon as truly wild or naturalised, although many are of opinion that the latter is indigenous. *I. fulva* occurs in some plenty on the banks of one of the numerous branches of the river Colne traversing the flat, moist, and partly wooded western parts of Middlesex. The flowers are large and showy compared with those of *I. parviflora*, a Siberian weed naturalised in many places near London, and it would well repay the cultivation in shrubberies and such places, where, when once established, it could take care of itself. The petals are orange-yellow heavily spotted with a deeper almost red colour, and the curious hooked spur of the larger sepals gives the flower a singular and unwonted appearance amongst the ordinary run of cultivated or garden plants. Its introduction to the better kept parts of the flower garden proper would be

fraught with a great deal of trouble and inconvenience, owing to the well known habit of all members of this genus—scattering their seeds far and wide on the bursting or exploding of the capsule by means of its strongly elastic valves. J. F.

TRITOMAS.

This genus is just now claiming a large amount of attention by cultivators of hardy flowers, and not without fully deserving it, the first of them beginning to flower about the middle or end of July, and others hardly past their best and November is even now with us. One great drawback, however, is the want of literature on the subject, for although Mr. Biker some few years ago published a faultless monograph, so far as types are concerned, the varieties or forms have been cropping up in such a way and in such numbers, each owner claiming a distinct origin for his particular form, that some kind of garden definition of them is imperative, else the existing chaos will widen, and confusion will multiply. Mr. Biker has gone so far as a botanist can go, and it now remains for some cultivator to take them up, collect all the varieties in cultivation, grow them in exactly the same conditions, and make his own deductions, adding his conclusions as a supplement to the above mentioned monograph. An example of what can be done with a popular genus may be seen in Mr. Maw's production, just published. H.

HARD AND FAST RULES FOR ORCHID GROWERS.

I THINK one of the greatest stumbling blocks an enthusiastic beginner in Orchid culture has to contend with is, what I may call the technical and hard and fast rules laid down for guidance by more experienced men.

No doubt Orchids do require a special treatment as regards season and temperature; this can all be learned in due time, but I think it is a mistake to follow too closely a decided line of treatment laid down by other people. If Orchids were treated more as other plants are, we should have fewer losses to mourn, and find our plants kept in better health. Take, for instance, the resting season. Novices in the culture of these plants—and in fact others besides novices—are apt to fall into the error of drying up their plants too much. They read in treatises on the subject, and in the gardening papers, that say "At such a time Orchids should be put to rest for the winter; water should be withheld and the temperature reduced." Following this advice in its literal sense, heat and moisture are too suddenly withheld, and many plants which have not finished their growths are checked and retarded, the consequence being immature and dwarfed growths, which drag on a sickly existence, neither resting, growing, nor flowering.

Another and hardly less disastrous result is, that plants which have finished their growth are dried up too much, present a wizened appearance, and hardly if ever recover their vigour. Here comes in the benefit of a common-sense method of treatment. Decidedly reduce the temperature and moisture, but do not starve. I speak emphatically from experience, bought by heavy losses through following a too rigid resting system. My practice at this season of the year is to keep one house separately for completing the growth of those plants which are later than usual, and in which a genial heat and moisture are kept up. As each plant completes its growth, remove into a cooler and drier house. This refers more especially to those requiring a warm treatment, such as *Cattleya* species, *Lælia*, *Dendrobis*, &c.

Odontoglossums I think we may treat far more uniformly. In the winter a house facing full south, and in which a temperature of 45°-55° is kept up, with a moist atmosphere, and constant bottom ventilation, is best. In summer most successful results are obtained by removing these plants into a sunken pit. This pit should be cemented inside and made water-tight, thus being kept half full of water. The plants are placed on a wooden staging about a foot above the water, and a shading, not too thick, kept about a foot above the glass. Syringed morning and night with a very fine spray engine these *Odontoglossums* make marvellous growths and foliage, and when transferred in the autumn to a house of south aspect they throw up sturdy spikes, giving promise of a rich harvest of flowers. In conclusion, I would not forget

to say that with all Orchids the more light and the more air that we give the greater will be the success. J. H. T. Peck, *Holly House, Bialy, Leicestershire*.

[This treatment would not suit some species, which are partial shade plants at home, the concentrated sun-heat in an English glass house being more than can be borne by the plants without injury. We have but to mention *Saccolabiums*, *Phalenopsis*, *Cypripediums*, *Vandas*, &c. Moreover, exposure to full sun means short-lived blossoms. Ed].

FRUIT GROWING.

MR. CHARLES WHITEHEAD, in one of a series of articles on this subject, suggests the establishment of jam factories in the chief centres of fruit production by companies of fruit growers, who would be assured of getting the full value of their fruit without excessive commission charges and railway rates—for it is assumed that the factories would be within carting distance of the fruit farms—as well as the profit upon its manufacture into jam. Mr. Whitehead says:—"Two or three jam factories have been started. One, the notable one founded by Lord Sudeley, is a typical instance of sagacious foresight. There is one in North Kent, and another, either in existence already, or soon to be formed, in East Kent. Until lately the growers could not see the good of local jam factories. This last extraordinary season has opened their eyes. Three years ago it was proposed to raise a jam factory in the neighbourhood of Maidstone, where there is a very large acreage of land planted with soft fruit bushes and Raspberry canes. The scheme was planned by three or four large farmers, thorough men of business, whose names carry weight. A prospectus was issued, and a circular sent to every fruit grower in the Kentish Directory, inviting assent to, or dissent from, the proposal. It will hardly be believed that not half a dozen answers were received, so that the ardour of the promoters was most effectually damped, and the scheme was abandoned. It is now felt that it would have been of inconceivable benefit to the whole of this locality, whose fruit crop has been amazingly abundant, if there had been a factory near to which fruit could have been consigned. With commission and railway charges saved, the growers would have been delighted to get a penny a pound, or less, for their fruit, and those who were shareholders would have received a good dividend besides. It is certain that no Plums and Damsons would have been allowed to spoil upon the trees had there been some such depot to receive them, either to be boiled up at once for jam, or to be simply pulped and kept in this state until a greater demand arose for fruit. It is rather astonishing that some of the enterprising growers did not improvise a jam factory, and use the copper in the wash-house to boil up some of the fruit that was wasting its freshness in the desert air. The Americans do these things better." *Berris's Worcester Journal*.

THE LATE COLONIAL EXHIBITION.

TOBACCO CULTURE IN BORNEO.—At the conference on Tobacco held at the recent Colonial Exhibition, the samples grown in Borneo and exhibited by the British North Borneo Company were commended upon as being of exceedingly good quality and appearance, and the prospects of Borneo as a Tobacco producing country were considered very favourable. Under the head of Tobacco in a recent report on the trade of Rotterdam, the following facts occur:—"The kinds principally imported are the Sumatra and Java, the quality of the former being such as to entirely dwarf as regards value the Java produced, the respective crops of 1884 having realised £2,304,000 and £660,000, whilst the total quantity of Java Tobacco sold was only 2787 packages less than the Sumatra—the totals being respectively 124,660 packages and 125,477 packages. In view of the circumstances that the soil and climate of North Borneo appear to be as admirably adapted to the cultivation of Tobacco as those of Sumatra, it may not be out of place to record a few particulars with regard to the planting operations in the latter island, initiated in 1864 by a Rotterdam firm, for by bringing the circumstances under more general notice British enterprise may be stimulated to embark on a similar venture in British North Borneo with the prospect of obtaining as brilliant a

reward as has been reaped by the shareholders in the several Sumatra Tobacco companies. In 1863 a Dutch gentleman and manager of a Tobacco plantation in Java proceeded to Sumatra and obtained from the Sultan of Deli a plot of land on most favourable terms, for the purpose of growing Tobacco, and having obtained the consent of his employers in Holland, the manager started operations on a limited scale in the following year. He at the outset experienced serious difficulties, in consequence of his inadequate knowledge of the new country, and the inexperience of the labourers in his employ, the result being that the crop yielded only about fifty packages, which were sold at Rotterdam at the equivalent of 83½ per cent. In 1865 the cultivation was extended, and 159 packages were produced, which fetched at public auction an average price of 2s. 3½ per cent. The crops of 1866 and 1867 produced respectively 174 and 224 packages, the former selling at 1s. 8½, and the latter at 1s. 0½ per cent; and after these experimental shipments for account of the Rotterdam firm, other parties commenced operations, resulting in the establishment at Amsterdam in 1869 of the Deli Tobacco Company. From that period dates the largely extended cultivation of the leaf, and the concurrent development and prosperity of Deli.

THE PLANTING SEASON.

WITH the unusually fine open weather of the past two months exceptional opportunities have been offered for the formation of new, or filling up of old plantations; and it is to be hoped that previous and timely advice given in these columns has been attended to, and that the bulk of the present season's planting is now all but completed.

The great advantages of early or autumn planting are now so well known and appreciated by practical arboriculturists, that it is quite unnecessary for me to occupy space in detailing them.

So few and peculiar are the cases, and these I entered fully into in a previous communication, in which it is really necessary to defer tree planting until spring, when March weather tells so detrimentally on young forest stuff, that there can be no excuse offered by those who still allow the season to come upon them before they are prepared for it.

To unseasonable planting combined, sometimes, with badly performed work, may be attributed many of the failures in newly formed plantations, as well as disinclination on the part of proprietors generally to enter largely, if at all, into the reclaiming of the waste lands of our country by the formation of carefully laid out woods and plantations. *A. D. Webster.*

TREES AS FODDER FOR STOCK.

At the risk of being accused of temerity I will, with your permission, once more advert to this interesting subject. I happened a short time ago to be spending a few days with an extensive stock farmer on the Cheviots, and one evening, when two farmers from the "other side" of the Border were present, the conversation turned upon the privations bill stock had to undergo last spring, not only on account of the difficulty experienced in obtaining hay, but in getting the provender delivered to them. It seemed from what I heard that Fir branches in many cases were cut and given to the sheep in order to preserve them from absolute starvation. Mr. Walter Clark, Blackburn, North Tyne, found both Scotch and Spruce Fir branches of great service when given along with hay. It was also stated that at Carlisle, Leader Water, Scotch Fir branches were extensively used when the hay supply seemed likely to run short. At Harbottle, Crags, Coquetdale, Mr. Elliot's sheep would have been decimated but for a timely supply of Scotch Fir branches from the Clennell woods, close at hand. It was affirmed that Spruce Fir branches caused giddiness, if not downright intoxication, in the case of some of the sheep. Perhaps their weak condition was to blame for this. None of them died. *F. Thomson, Maxton, November 17, in "Lice Stock Journal," December 3.*

TENDER FOR TREES AND SHRUBS.—The Parks Committee of the Newcastle Corporation have accepted the tender of Mr. W. J. Wigham, Fenham Nurseries, Newcastle, for the supply of 10,000 trees and shrubs for the Nun's Moor Recreation Ground in that city.

The Flower Garden.

WALKS.

CONTINUE to sweep and roll lawns, &c., to maintain a tidy appearance. When there is so little else to be seen at this dull season walks may be made to look fresher by having the gravel turned, raked, levelled, and trodden firm, again raked, and then well rolled until it becomes perfectly hard and smooth. To making or remodelling walks the first essential is that surface-water must be got rid of as fast as it falls, and never allowed to accumulate in such volume as to make channels in the walks. The crown of the walk should therefore be some inches higher than the sides, and on steep declivities water grids should be placed every 10 or 12 feet. These need not be large—6 inches square is ample for a walk 6 to 8 feet wide. When the walk is from 10 to 12 feet wide a grid 8 inches square should be provided. The worst kinds of grids are those with wide openings, which allow the leaves to enter the drains, rendering them soon inoperative. Where heavy carting is done on broad walks they very soon get rutted by the wheels constantly rutting in the same place unless a good sound bottom be used. Very little gravel should be employed on such walks—they should be mainly constructed of flints or granite, with a blending of gravel. This will withstand any amount of wear.

BEDDING-OUT PLANTS.

Examine the stock of bedding plants. Pick all flowers and dead leaves off Pelargoniums. If in boxes they may want watering, but they are better on the dry side. See that mildew does not obtain a footing on Verbenas; if there be any indication of it, dust with flowers of sulphur instantly. With changeable weather greenfly is almost certain to manifest itself, and a watchful eye must be kept on all subjects which are liable to become infested. It is better to fumigate slightly for two or three nights in succession than to administer a strong dose. See that varieties of Iresines do not receive too much water at this dull season.

Keep Tropaeolums, Mesembryanthemums, and succulents generally, cool and rather dry. Alternantheras are better if kept on the move, but they should not be over-watered. See that nice do not get into cold pits among cuttings of hardy subjects. They often cut over cuttings wholesale, and carry them off to their nests to make their nests.

Remove all dead leaves from any cuttings striking in cold frames, and endeavour to maintain a healthy atmosphere. Clear away all dead foliage from Lily of the Valley beds, and give them a top-dressing of rich soil. *W. M. Baillie, Luton Hoop Gardens.*

PLANTS AND THEIR CULTURE.

BERRIED PLANTS.

THERE are no plants more cheerful looking in effect than these, and useful also in all sorts of decorations. *Rivina humilis* is attractive, and if some means could be adopted to preserve its brilliant berries from falling off, its value to the gardener would be much greater. The best way to retain them I have found to be, is to keep them close up to the glass, at the same time giving liquid manure freely, and on no account to allow the soil to become dry. *Ardisia crenulata* is another useful plant, possessing neat leathery shining foliage, and if treated properly it sets an abundance of red berries. When grown as small standards from 1 to 2 feet high; it is a very telling plant, stood among table decorations. *A. crenulata alba*, white-berried, is a fitting companion to the first-named. *Solanums* make charming objects; *Prince and Princess of Wales*, and *Williams' Little Gem* answer admirably for dwarf decorations; the latter variety grows to about 3 inches high and placed into small jars and set amongst flowers on the table, is much admired; the sort is free in fruiting. *S. capsicastrum*, of which *Weatherall's* hybrid is still several kinds, when fruited well (which there is difficulty in doing), afford much variety in effect, the bright berries standing prominently from out of the fine foliage. *Aucubas* stand well the dry air of living-rooms, and are not injured by being stood in badly lighted recesses. *A. Evans, Lythe Hill, Haslemere.*

FRUITS UNDER GLASS.

STRAWBERRY FORCING.

WHERE ripe Strawberries are required at the end of February, no time should be lost in getting ready a batch of plants—*Vicomtesse Hericart de Thury*, or some other equally good kind. These in the first place should have the drainage seen to, and the surface-soil should be scratched over with a pointed stick, the soil loosened, removed, and the ball of earth and roots pressed down with the hands prior to top-dressing with a sifted compost of loam and horse-droppings in equal parts. This should be made moderately firm by the aid of a potting-stick, and a space of three-quarters of an inch below the rim of each pot should be left to hold water. If a pit is at command it can be filled with Oak or Chestnut leaves to within 9 inches of the top, it will be a very suitable place in which to bring on the plants. These should be plunged therein to the rims of the pots, afterwards allowing the soil to get moderately dry before giving tepid water at the roots. The gentle bottom-heat and moisture supplied by the fermenting leaves will providing the plants have been well grown, and the pits kept closed by day, and a sufficient covering of Fern or other protecting material be put on at night to keep out frosts, lead to the production of flower-spikes by the first week in January next. The pots should then be washed, and the plants removed to the top shelves of a forcing-house, and if they are near the ventilators so much better will be the setting and flavour of the fruit. A dry buoyant atmosphere at a temperature of 50° at night and 10° or 15° higher by sun-heat should be maintained in the flowering stage; and to assist the setting of fruit the pollen on the blossoms should be distributed by a camel's-hair pencil being passed over them every day when the flowers are dry. After this the night temperature should range from 55° to 60° according to circumstances, and 1° higher by day with fire-heat, running it up to 85° with sun-heat at closing time when the plants should be damped overhead with tepid water, in addition to damping the house generally so as to promote a growing atmosphere. When the plants require water at the roots, give sufficient to moisten the whole ball, and from the time they have set their fruit until it begins to colour weak liquid manure at a temperature of 75° should be given when watering is necessary. Where pits are not at command the plants should be put on shelves fixed in an early viney or peach-house as soon as they are got ready; syringing the plants overhead when damping the Vines until they come into flower, when it should be discontinued for the time being, and the plants treated as already advised. *H. W. Ward, Longford Castle.*

The Kitchen Garden.

FORCING.

Seakale and Rhubarb.—For those who have not the necessary accommodation for lifting and forcing indoors, forcing on the ground by means of fermenting material only, must be resorted to. The space between the plants having been forked over and cleared, suitable pots or boxes should be placed over the crowns. For Seakale all air and light should be effectually excluded, but for Rhubarb this is not essential; indeed, a little provision for the escape of rank steam and vapour is not only better for the development of the young growths, but the quality also is much improved. For fermenting material, consisting of leaves and stable litter, having been prepared beforehand, should be placed around the required number of pots or boxes in sufficient quantity to produce a steady heat of from 80° to 90°; this as the heat declines should be renewed from time to time, by being turned over and added to. In either case, before covering the crowns, a sprinkling of fresh slacked lime should be given, and afterwards a few sweet leaves placed within to encourage and promote growth.

Asparagus.—Frames or pits that have been prepared for these, as advised in a previous Calendar, will now be ready to receive them, a few inches of light soil having been placed over the surface of the fermenting material; the plants should be carefully lifted with as many of the roots, and as much of the soil attached as practicable, placing them as close together as possible, filling in and covering the crowns with fine soil to the depth of from 3 to 4 inches. A gentle watering should then be given, sufficient to settle the whole mass, and the frame kept closed until the "grass" shows, when liberal soakings of tepid water must be administered, and air given when necessary. *John Austen, Witley Court Gardens.*

The
Conferences.

ONE excellent feature introduced into the proceedings of the Royal Horticultural Society of late years has been the institution of Conferences on various horticultural matters. An amount of vitality and energy has been infused into these meetings which has in many ways been productive of excellent results. Something has been attempted and something has been done—and not unworthily done either. The interests of Orchid growers, Narcisso-maniacs (we intend nothing disrespectful), Auricula lovers, Primrose growers, and pomologists, have all been studied; but much more requires to be done in the same direction, and we trust we may see the Society taking up such work as that which it has allowed special societies to undertake to its detriment. We hear now and then of a proposition to found an Orchid Society or a Potato Society, but we lock upon all such schemes with regret. It would be preferable that all special societies of this kind should be incorporated with the parent society. That body should exercise imperial, though not despotic sway, and allow each special society as large a measure of Home Rule as might be consistent with the maintenance of the central authority. The Royal Horticultural Society under this idea, would be like the central government of the United States of America, while the several committees and the special societies would resemble the several States of the Union, each with its independent local legislature, but subordinate to the central body for all "imperial" purposes. The present state of sub-division weakens the main body without any corresponding advantage that we can see, and that just at a time when union is most desirable. We do not, at this moment, intend to discuss this subject in detail, but we may cite one illustration of the way in which the central body may gratify its Fellows and establish a firm bond between itself and the committees of special societies, and that illustration is afforded by the publications of the Society. We doubt whether any literary document more generally acceptable to the horticultural public has been issued of late years than the publication drawn up by Mr. BARRON, of "British Apples," and which was the direct outcome of the Apple Congress. The Orchid Conference Report, too, is most valuable. Where can anything of its kind, for instance, be found to equal in importance Mr. VEITCH's paper on "Hybrid Orchids"? The last publication of the kind, and one just issued, is the Report of the Primula Conference, held last April, and that of the second Orchid Conference, held at Liverpool in July. The Primrose Report, we venture to say, contains an amount of varied information on subjects relating to Primroses never before got together, and likely to be of great service to florists and Primrose lovers of all kinds and degrees. In this direction, then, the Society has been, and is doing, thoroughly good work,

justifying its existence, giving something of permanent value to its Fellows, something of which it need not be ashamed, but, on the contrary, concerning which it may well feel some complacency. A conference on similar lines—devoted to Vines and Vine-culture, to Fern-culture, to Potato-growing (if that is not for the moment overdone), or to Tree-planting whether for timber or ornament—would be acceptable. On any one of these subjects much

to seek the same accommodation elsewhere. The first proposal may at once be dismissed; the Society is far too useful to be dissolved. In some shape or other it must be maintained, if only by and for the horticulturists. The second and third proposals urgently demand instant and most careful consideration. We shall not attempt on the present occasion to discuss the matter further than to say, that if the Society remains at South Kensington, the business office at least must not be in the cellars of the Albert Hall.

The National Chrysanthemum Society and the Potato Tercentenary have shown that South Kensington is not the only available site; and that if a proper place can be found for offices, meeting rooms, library and reading-room, as we doubt not can be done, the question of a larger hall for occasional great exhibitions could easily be solved.

FIG. 146.—SHOOT OF ABIES LOWIANA.

information might be pleasantly got together and interesting exhibitions made. We should have added the various groups of florists' flowers—Dahlias, Chrysanthemums, Roses—but these are now taken up by special Societies, and the Royal Horticultural Society could now only take up these questions by arrangement with the minor bodies, as indeed was done with

FIG. 147.—ABIES LOWIANA: SECTION OF LEAF MAGNIFIED.

excellent result in the case of the Auricula Society.

The larger and more urgent question—What is to become of the Society?—we are quite aware has to be settled. We hope some measures may have been taken by the Council during the vacation, but if so, nothing has reached the public ear. There are the Gladstonian three courses—to dissolve the Society; to come to some arrangement with the Commissioners or the managers of the Albert Hall to secure proper offices, committee-rooms, a meeting room, and room for the library; or

—DECORATIVE GROUPS.—In our next issue we shall give a supplementary illustration showing a group of plants arranged for effect by Messrs. R. VEITCH, of the Exeter Nurseries.

—THE BOTANICAL DEPARTMENT, JAMAICA.—We understand that Mr. FAWCETT, assistant in the Botanical Department, British Museum, has been appointed to the post in Jamaica lately held by Mr. D. MORRIS, now the Assistant Director, Royal Gardens, Kew.

—THE VINTAGE.—Later reports confirm our previous announcements as to the excellent quality of the vintage in most of the wine growing districts of France, especially in Burgundy.

—“FAMILIAR GARDEN FLOWERS.”—In the last number Mr. SHIRLEY HIBBERD discourses of the Chrysanthemum and the Cactus; while in *Familiar Trees* Mr. BOULGER treats of the Holly. In both cases the letterpress is interesting.

—HOOKER'S "ICONES PLANTARUM."—Two parts of this have lately been issued, the one containing the drawings and descriptions of various flowering plants from Tropical Africa, Central China, Australia, and elsewhere. Dr. KING describes a new species, or perhaps variety, of the Mahogany, differing from the ordinary form in habit, size of leaf, period of flowering, and in the fact that at Calcutta this variety produces seed freely, while the common form rarely forms seed at all. Another part is entirely filled with illustrations and descriptions of new or rare Ferns, from the pen of Mr. BAKER.

—“THE ROSARIAN'S YEAR BOOK FOR 1887.”—(tenth year issue)—edited by the Rev. H. H. D'Ombra, Honorary Secretary of the National Rose Society, will be published on January 1, 1887. Its contents are announced as follows:—1. Mr. George Prince (with photograph), by the Editor. 2. A Symposium on Orange Fungus (illustrated), by Worthington G. Smith, F.L.S.; D. T. Fish; Rev. J. A. Williams; W. J. Grant; J. T. Burrell. 3. Champion Roses, by Ben R. Cant. 4. Twelve Years' Experience of Rose Growing in Scotland, by Alexander Hill Gray. 5. The Rose and National Rose Society in 1886, by the Editor. 6. Species of Roses, by T. W. Girdlestone. 7. The Rose Weather of 1886, by E. Mawley, F.M.S., Honorary Secretary of the National Rose Society.

—AN ALBUM OF CHRYSANTHEMUMS.—At a meeting of the Floral Committee of the National Chrysanthemum Society, held on Wednesday, December 8, it was announced that an Album of the queen of autumn flowers has been prepared for publication by Mr. IERMAN PAYNE, and which we shall notice more fully in our next issue.

—MR. MAW'S MONOGRAPH OF CROCUS.—This is about the best illustration we could point to of a conscientiously executed, beautifully illustrated, and thoroughly well got-up Monograph. We shall have occasion to speak of it more at length on another occasion; but we cannot help at once alluding to it as an example of what such a book should be. Nothing seems to have been omitted that came at all within the scope of the volume—nothing has been taken for granted that it was possible for the author to verify by personal research—nothing has been

FIG. 148.—*ABIES LOWIANA*, OR *FICHA LASIOCARPA* OF GARDENS: CONES CHESTNUT-BROWN. (SEE P. 755.)

cited at second-hand without acknowledgment, and citation of chapter and verse.

— **REPORT ON THE DISEASES OF APPLES AND PEARS.**—MR. FRAZER S. CRAWFORD has published, under the direction of the South Australian Government, a report on the fungi and insects affecting Apples and Pears, together with the reports as to the best means of combating these plagues. The report is thoroughly practical, containing the most recent available information. Would that our cultivators could be brought to appreciate the loss they experience from want of knowledge. It is disheartening for students of fungi and entomologists to give, as they mostly do, their time and their services, and to see that small heed is paid to their recommendations.

— **VEGETABLE TUMOURS.**—In a paper by Mr. ROGER WILLIAMS on vegetable tumours in relation to bud formation (*Lancet*, November 20, p. 973), he describes these outgrowths, whether consisting of woody nodules, continuous tumours, or excrescences, presenting a surface thickly studded with shoots and stunted branches, as essentially due to an excessive formation of buds from over-nutrition (hypertrophy). He considered excess of nutriment to be the chief factor in the production of these growths. Like animal tumours, they originate in remnants of undifferentiated embryonic tissue.

— **"INSURANCE YEAR BOOK."**—MESSRS. SIMPKIN, MARSHALL & CO. have published a complete list of the insurance offices of this country, with much information concerning annuities and insurance of various kinds.

— **THE SKIN OF THE LEAF.**—M. VESQUE is continuing his researches on the functions of the epiderm, or skin of the leaf, in various plants. This layer consists usually of flattened cells, destitute, or nearly so, of colouring matter, but containing water, and serving as reservoirs for that fluid, the evaporation of which is prevented in many cases by the thickened wall of the exposed surface of the cell by the exudation of waxy matter, the presence of hairs, &c.

— **A POTATO SOCIETY.**—A suggestion was thrown out at one of the meetings of the Potato Conference that means should be taken to establish a Potato Society. We think it a great pity that the Royal Horticultural Society does not render such suggestions unnecessary, by inaugurating, if not a Potato Committee, at least one or two special Conferences annually, after the fashion of the Orchid Conference. MACAULAY, contrasting the Church of Rome with that of England, stated that the latter drove JOHN WESLEY from its pale, and so laid the foundation of the now powerful Wesleyan body. Had such a man appeared in the Romish Church his ecclesiastical superiors would have had astuteness enough to place him in some position where his great zeal and abilities would have been turned to good account for the benefit of the Church. We always lament the frittering of energy and the narrowing of aim that are inseparable from special societies, whether for Roses, Orchids, Chrysanthemums, Auriculas, or what not. If the Royal Horticultural Society were less supine than it is, it would, while giving all these bodies home rule, take care that they were all in federal union with itself. What possible need would there be for a separate Potato Society if the Royal Horticultural Society would rise to the level of its duties?

— **THE TREE TOMATO.**—In the *Proceedings* of the Agri-Horticultural Society of Madras Mr. D. MORRIS adverts to this fruit, which we occasionally see in Covent Garden under the wholly erroneous name of Granadilla. It really is the fruit of a Solanaceous plant not remote from the Tomato and Egg-plant, and is of an oval form and bright orange colour. It has never made much way in this country, but is much appreciated in the West Indies. Mr. MORRIS, with his usual energy, has distributed the plant widely, and gives the following directions for its cooking:—The fruit should be allowed to ripen thoroughly on the tree. For cooking purposes all the seeds and the outer skin should be removed; the pulp of the fruit should then be cut into quarters and stewed, or cooked like Apricots, or made into jam or jelly. If too acid it may be steeped in boiling water for a few minutes before using. On the Nilgiris the fruit is highly esteemed. It is curious that the plant

is so seldom mentioned in popular books. It was, however, figured long ago in ANDREWS' *Botanical Register*.

— **CLASSIFICATION OF POTATOS.**—In addition to the ordinary classification according to colour and form, M. HENRI DE VILMORIN has, as we announced at the time, propounded one according to the colour and general appearance of the shoots as they emerge from the tuber when in a dark place and not exposed to the action of light. This is, of course, an hereditary character, not influenced by external accidents so long as the tubers are kept in the dark, and therefore a character of great importance as regards constancy and trustworthiness.

— **LINNEAN SOCIETY OF LONDON.**—The next meeting of the Society will be held on Thur. day, December 16, at 8 P.M., when papers will be read:—1. "On Apospory and allied Phenomena," by Professor F. O. BOWER. 2. "Experiments on the Sense of Smell in Dogs," by Dr. G. J. ROMANES. 3. "On a new instance of Apospory in *Polytrichum angulare*," by C. T. DRURY.

— **POTATOS FOR FORCING.**—One of the prettiest exhibits at the late Potato Tercentenary consisted of some sets of the Marjolin or kidney Potato, neatly packed in hay, like eggs, in a basket, and with a solitary purple shoot at one end. In the neighbourhood of Paris, says M. DE VILMORIN, it is customary to cause the sets to sprout by placing them in an erect position on hurdles in a dry place where frost cannot hurt them. At the time of planting the hurdles with the sprouting sets are carried to the garden, and each is carefully deposited in the hole made for it. Potatos thus treated have an advantage of ten to fifteen days over others not so treated, hence the advantage for frame culture and early forcing generally. The baskets exhibited by MESSRS. VILMORIN were intended for transit by rail, a little hay or other protective substance being placed over the tubers.

— **THE POTATO EXPERIMENTS AT MESSRS. SUTTON & SONS.**—We are requested by EARL CATHCART to insert the following communication:—

"I am sorry to observe in the horticultural Press that in relation to recent Potato experiments some reflections have been made in regard to the authorities at Kew. With Mr. BAKER, F.R.S., of Kew, I have today visited the Reading collection. We have been vastly interested, and I am allowed to say for both of us, instructed. MESSRS. SUTTON and myself are the persons most interested, and I beg to add we are grateful to the Kew authorities for unvarying attention and kindness, and we have nothing but appreciation to express in regard to that invaluable national institution. CATHCART."

MESSRS. SUTTON, we know, took great pains to avoid any offensive imputation on Kew, and are not responsible for what was said by others. The querulous tone of the remarks, and the imputations made on Kew and its management were unfair and uncalled for. Of all our public institutions there is scarcely one so well managed as Kew, and this is proved by its being almost the only public institution in which we are not surpassed by other countries. We have indeed reason to be proud of Kew, but of course mistakes may be made there as well as elsewhere.

— **ROSES IN DECEMBER.**—MR. MCGHEE, the gardener to A. D. BRYCE DOUGLAS, Seafield House, Ardrossan, Ayrshire, sends us blooms cut from plants in the open border, fresh and fragrant, with no trace whatever of injury from frost. The sorts were Gloire de Dijon, Jules Margottin, and a bud of apparently Captain Christy. With our experience in the South of 15° of frost, followed by a mild rain, flowers of almost all kinds have now perished.

— **NATIONAL AURICULA, CARNATION, AND PICOTEÉ SOCIETIES.**—The annual meeting of the above Societies was held in the East Crush-room of the Royal Albert Hall, on Tuesday, December 7. Harry J. Veitch, Esq., presided. Present: Rev. H. H. D'Ombraim, and Messrs. Laing, James, Cannell, Dean, Duffield, Hill, Turner, Pearson, Paul, and J. Douglas, Hon. Sec. The Presidents, Vice-Presidents, and committee were unanimously re-elected. Messrs. T. Fife and C. Phillips, both of Reading, were elected members of the committee of the Auricula Society; and Mr. T. E. Henwood, of Reading, and

Mr. M. Rowan, of Clapton, were elected members of the Carnation Society. Mr. Roll has resigned his post of Treasurer to both societies, and Mr. Shirley Hibberd was unanimously elected in his place. Mr. Douglas was re-elected as Secretary; Mr. Veitch was re-elected as one of the auditors, and Mr. Moore elected as co-auditor with him, in the place of Mr. Hibberd resigned on his appointment as Treasurer. It was decided to hold the Auricula show on April 26, 1887, and the Carnation and Picotee show on July 26. It was also unanimously decided to alter the name of the Auricula Society to that of the Auricula and Primula Society. Owing to the illness of the Treasurer, the statement of accounts was not presented to the meeting.

— **ADIANTUM FARLEYENSE.**—Several fronds have been sent to us with indistinct indications of spores under the recurved edges of the frond as customary in *Adiantum*. Hitherto we have not seen any perfect spore-cases, though from the evidence lately published there is no doubt that they may occur now and then.

— **ALOES.**—The December number of the *Revue Horticole* contains a coloured figure of *Aloe Dyckiana*, *A. roseo-cincta*, and *A. plicatilis*, all three producing massive spikes of brilliant crimson flowers like those of a *Tritonia*, but with spikes more than a yard high, and produced from a rosette of fleshy, lanceolate leaves forming a crown to the stem 3 feet or more in height. *A. Dyckiana* forms a conspicuous ornament out-of-doors in the gardens of the Riviera, but is amply worth cultivating under glass here.

— **PINANGA DECORA** is a handsome stove Palm lately received from Boroee by the Compagnie Continentale of Ghent. According to the figure of the young plant given in the *Illustration Horticole*, t. 614, the stems are spineless, the leaves sheathing at the base, with long stalks, and pinnately divided blades, the segments of which are lanceolate acuminate, of a deep green colour, flushed with bronze.

— **NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.**—The following is the programme for the forthcoming meetings (at Aberdeen):—Feb. 18 (7 P.M.): "Herbaceous Plants," by WM. CUNNINGHAM, Kintore Nurseries; and "Botanical Geography," by Mr. MAITLAND, Cawdor Castle Gardens. March 18 (5 P.M.): "Worms," by Professor NICHOLSON, University. This lecture will be delivered in Professor NICHOLSON'S class-room, Marischal College. April 15 (8 P.M.): "The Formation of Lawn Tennis Grounds," by A. GILES, Union Place; and "Amateur Grape Growing," by JAMES SCOTT, Deemout Road. May 20 (8 P.M.): "Bees," by L. TAIT, Forvaran.

— **THE ROOTS OF PULSES.**—The existence on the roots of Peas, Beans, and Papilionaceae generally, of small tubercles or nodules has long been known, and the growths in question have excited much attention on the part of botanists. It now appears probable that these little growths, which the purely practical man would deem of no importance, are of great consequence in connection with the absorption and digestion of nitrogenous food, and the conversion of insoluble and inert nitrogenous matter into soluble food by means of minute organisms. Such facts could never have been guessed by the most experienced practitioner in any length of time, and yet they are matters of cardinal importance to him.

— **EUCALYPTI.**—Our correspondent, "J. W.," of Bradford, Collumpton, in respect to these species of Australian plants, writes:—"I have been testing the hardness of some of the Eucalypti from seeds of the more robust sorts given me by my friend M. NAUDIN, of the Jardin Thuret, Antibes. Last winter was a very severe one. E. viminalis stood it well; E. sideriflora, E. rostrata, E. radis, and E. botryoides, were killed to the ground, but are sending up strong shoots; all the others were quite killed. E. coccifera is well known to be hardy, and did not suffer at all. I got the plant some two years ago from a nurseryman, but out of six since purchased I have only saved two, and these were greatly injured by having been kept in small pots instead of being planted out and transplanted. It is of no use to plant a tree with corkscrew roots, and one may as well kill it at once by attempting to unwind their tangle, which has been the fate of all mine but two. I wish I knew where I could get seed of this variety."

— PUBLICATIONS RECEIVED.—*Proceedings of the Agricultural and Horticultural Society of India for October, 1886.* (Calcutta: T. S. SMITH, 12, Bentinck Street).—*Journal of the Royal Horticultural Society*, vol. vii., No. 2: *The Report on the Primula Conference at South Kensington, and on the Orchid Non-manufacture Conference at Liverpool.*—*Live Stock Journal Almanac, 1887.* (London: VINTON & Co., Limited.)

— GARDENING APPOINTMENTS.—Mr. HEARD, late Gardener to M. J. FREEMAN, Esq., of The Grange, Exmouth, Devon, has been appointed Head Gardener to T. F. E. FAY, Esq., Clay Hill, Enfield, Middlesex.

LOW'S SILVER FIR.

WE gladly avail ourselves of the opportunity afforded us by Mr. Heale, of the Cranston Nurseries, Hereford, of figuring the cones of this much controverted Silver Fir (fig. 143, p. 753). As to the genus to which it belongs, some persons place it in *Abies*, some in *Picea*, and others, more comprehensive in their views, range it under *Pinus*. So long as we know, or are told, in which sense they use the particular word, it does not matter which generic name be adopted. As to the specific name there has been even greater diversity of practice. Some say it is a distinct species, some say it is not. Some think it is a variety of concolor, others deem it to be concolor itself, while yet others range it under grandis.

Professor Sargent, to whose authority all deference is due, while criticising some remarks of our own, suggests that there may only be one very variable form extending from Oregon to South California, and thence inland to Utah and the Rocky Mountains of Colorado. Under this view *Abies grandis* of Lindley would include—1, the typical form so common in gardens together with the Vancouver Island form (Gordoniana); 2, the Californian form, that is now under consideration; and 3, the variety concolor, found in the Rocky Mountains and Utah.

For garden purposes these three forms are usually distinct enough to be kept separate and so, in garden catalogues, we are recommended to recognise *A. grandis*, the coast form; *A. Lowiana*, the Californian form; and *A. concolor*, the Utah and Colorado form with the pointed leaves glaucous on both sides and the relatively large buds. We are inclined to think this is as satisfactory an arrangement as any that has been proposed.

Now as to the name of this particular species, variety, or form, it has been called *lasiocarpa* and is perhaps most widely known in gardens under that name. It has been called *Parsonsiana*, and it has been ticketed as *Lowiana*. The name *lasiocarpa* is, no doubt, quite wrong as applied to this plant, and so that must be abandoned in that connection. The name *Parsonsiana* is a mere catalogue name published without description or figure, and therefore not worthy of being permanently retained in any authentic register. There remains only *Lowiana*, and whether the reader chooses to call it *Abies Lowiana* (as we should do), or *Picea Lowiana*, or *Pinus Lowiana*, as any one else is at liberty to do, is of no great consequence, so long as it is clear by which name the Silver Firs, the Spruces and the Pines respectively are meant. Meanwhile, for popular or garden usage, the phrase Low's Silver Fir, obviates all difficulty. Having so recently and so frequently referred to the botany of this tree, we forbear to inflict any further technicalities on our readers. It must suffice to say, that it was introduced into commerce from California in the first instance by Messrs. Parsons, of Flushing, United States, and imported into England in 1855, by Mr. Smeart Low, so that in some sense Messrs. Parsons might seem to have some claim to priority; but as this is only accorded to plants authentically named, described and registered, their name is displaced in favour of a name technically correct. Mr. Barron, of Elvaston Nurseries, has repeatedly told the story of the origin of this tree in our columns (see specially vol. v., 1876, p. 78), and one of the originally imported plants is in his nursery. Leaving debatable matters, we shall all agree that Low's Silver Fir is a handsome tree; it is massive-looking, pyramidal in outline, with close tiers of rather stiff, horizontal, or pendulous branches. The young shoots are generally flexible, glabrous, olive-brown in colour, and with long spreading leaves in two or more ranks, and generally pretty uniform as to length. The leaves are usually blunt at the tips, occasionally

notched, channelled on the upper surface, and with a projecting midrib beneath. The colour varies considerably in different specimens, but an olive-green hue above and a silvery lustre beneath are the most common conditions. Breathing pores, or stomata, exist on both surfaces. Usually the leaves spread on either side of the shoots in one horizontal plane, but sometimes they are more or less upturned. The buds, especially those at the ends of the shoots, as was originally pointed out to us by Mr. Barron, afford a good means of discrimination from those of the true concolor. The buds of Low's Silver Fir are usually relatively smaller, chestnut-brown, more or less bluntly-conical, or even pyramidal at the base, while those of concolor are larger, paler, rounder, or more cylindrical, according to the stage of growth, and less often smeared with resin. Low's Silver Fir, like the true grandis, does not stop growing in autumn so suddenly as does concolor; and the consequence is that, while in concolor there is a well-marked interval between the ordinary leaves and the bud-scales in grandis proper, and in *Lowiana* the ordinary leaves are often more or less mixed up with the bud-scales. Of course we are speaking of specimens cultivated in this country. How it is in the wild state in this respect we do not know. In this country, moreover, *Lowiana* does not begin to grow so early in the spring as either grandis or concolor. The cones of *A. grandis* (a figure of which was given in our columns, vol. xxiv., 1885, p. 561, fig. 128, and which should be compared with those now given) are of an apple-green colour ripening into a bronzy-green, both in the wild and in the cultivated plant—quite a different hue from the rich chestnut-brown of the cones of *Lowiana* here figured. In grandis the cones grow sometimes singly, sometimes in groups, as in the *Lowiana* now figured. The timber of grandis and of concolor is not of any great value in its native country, the wood being soft, hence it is probable that the trees in question will not be of much value in this country for other than decorative purposes.

Florists' Flowers.

THE SHOW AND FANCY PELARGONIUM.

THE more quiet these can be kept the better it will be for their future healthy growth and free flowering. The most frequent cause of failure to produce healthy well-developed plants is due to the fact that the atmosphere is kept too close, and the temperature too high, in winter; the plants at the same time being overdone with water at the roots. The months of December and January are the most critical. The plants should be placed close to the glass roof, and not in close contact with each other. As to watering, it requires an experienced cultivator to do it well. If they receive too much water with a higher than cool greenhouse temperature the growths will be watery, the head of bloom irregular, and not of the best quality; if the temperature is low, with too much water the leaves become infested with a disease usually termed "spot," if they do not get enough water, and the soil becomes dusty-dry, the lower leaves on the shoots will become yellow and drop off. Let the soil become dry, but judge by its appearance that it contains some moisture. In applying water, see that the whole mass of roots is thoroughly moistened with rain-water as warm at least as the atmosphere of the house. The small-flowered, or "fancies," require the temperature to be about 5° higher than the cool greenhouse usually receives. By a cool greenhouse temperature I mean one from which frost is just excluded by a fire when the temperature is likely to fall below 35° on frosty nights. The large-flowered varieties are not injured if it should get as low as the freezing-point, but the "fancies" would be. For large specimens intended to flower in June, 35° to 40° in frosty weather is a perfectly safe minimum temperature. Not much work will be required amongst them during the next few months, except to keep them clean, and probably some of the growths will require to be tied out; this must be done very gradually. Small plants in 5-inch pots do not require anything like so much care in watering, or attention in other respects as specimens do.

THE AMARYLLIS.

AS I write these lines we are mixing the compost. This is as simple as possible; two parts good turfy loam to one of leaf-mould, one of turfy peat, and one

of decayed manure; some rough sand may also be necessary. I like the compost to lie out-of-doors for about two months before using it. The manure in that case becomes more thoroughly incorporated with the remainder of the compost. The plants are now thoroughly at rest. All the decayed matter has been picked from the crown of the bulbs, and as thrips were found on some of the leaves we dusted the crown of each with some tobacco-powder, and as a further precaution the houses were well filled with tobacco-smoke. This can be applied in sufficient density to kill the thrips without injuring the resting bulbs. Seedlings of last season ought to enjoy a rather warmer temperature, and must not be quite dried up; the leaves remain green all through the winter. J. Douglas.

Foreign Correspondence.

GREEN FROGS.

NOW that these creatures are so frequently kept in hothouses in England, I may inquire whether it has been remarked that they adapt their colour to the objects on which they may find themselves, precisely like chameleons? I have had the opportunity of observing both in my Orchid-houses. The frogs are generally of a bright grass-green, but they vary their colour to an almost green-black, to a pale yellow-green, and to a deep brown-black. On *Cypripedium nevium* I mistook one lately for a crumpled leaf, so closely did its colour assimilate to that of the plant; another I thought was a fungus, so closely did it resemble the rotted sphagnum on which it stood; whereas others on sallow-leaved Orchids had taken precisely their colour. H. J. Ross, Florence.

MASSACHUSETTS HORTICULTURAL SOCIETY.

AT the show of the Massachusetts Horticultural Society held at Boston recently, the flowers and plants were excellent; some seedlings of American origo as well as French and English varieties being amongst them. Harvard University Gardens contributed a fine collection, not for competition; and the others came from gardens in the locality. Mr. F. T. Ames' collection of plants consisted, amongst others, of the following:—*Cattleya gigas imperialis*, a very large and finely colored flower; *C. Fausta crispata*, a new hybrid; *Reneanthera coccinea*, *Oncidium varicosum* Rogersi, larger and of brighter colour than the type; and *O. Jonesianum*, new, and promising to be very fine. There were also two plants of the Pine-apple family—*Tillandsia Lindenii* vera (rare), and *Vriesea brachystachya*.

Charles F. Evans, of Philadelphia, exhibited the new white Rose Puritan, one of Bennett's hybrids. Norton Brothers had a small collection of beautiful Roses. Mrs. Francis B. Hayes had a collection of Camellias, Roses, Laperagias and other cut flowers; and Edwin Sheppard a variety of Pelargoniums. Mrs. P. D. Richards had a large collection of native plants, among which the richly-coloured fruit of the Black Alder and Bitter-sweet were conspicuous.

The prize Beurré Diels, Glou Morceau, and Beurré Laxeglaires were excellent, and the show of Apples was fine.

VEGETABLE PRODUCTS OF MEXICO.

In a recent report from Mexico the following vegetable substances are referred to as products of the country. After coined silver, it is said, the most important article in the list of Mexican imports is now Henequén, a fibre produced from the leaves of the *Agave sisalana*, of Yucatan. According to figures furnished by the exporters, upwards of 93,000,000 lb. weight of this fibre were exported in 1884-5, producing a value on board ship of more than £550,000. In the course of the five years between 1879 and 1884 the export of this plant more than tripled its value. It is another important fibre which is beginning to attract notice; it is extensively used for making brushes, and certain portions of it are spun into thread. It is derived from the *Agave ittle*, and recently from the *Agave or Magvey* (*Agave americana*), from which Pulque is made, and which is produced in great plenty in the valley of Mexico, and other parts of the country. Pulque is consumed in vast quantities, but until lately the outer leaves had been regarded as waste. The invention of effective processes for detaching and cleansing the fibre will now enable it to be produced on a very large scale.

The exportation of Ixtle reached in 1884-5 a value of £112,000. The next agricultural product on the exportation list is Coffee, of which during the year 1884-5, Mexico exported about £200,000 worth, as against upwards of £260,000 in 1883-4. In the five years between 1879-80 and 1883-4, Mexico exported to the United States alone nearly 60,000,000 lb. of Coffee, valued at somewhat less than £1,200,000. From the foregoing figures it appears that the United States are the chief consumers of Mexican Coffee, which berry is one of the very few products which pay no Customs duty on entering the Republic. Uruapan, in Michoacan, produces Coffee of the most delicious flavour, which took a 1st prize at the United States Centennial Exhibition of 1876; many judges consider it equal to the best Mocha, Martinique, and Java Coffees. The cultivators of Cocoa in 1886 have not realised the sanguine expectations of M. Basto, for some £8000 to £10,000 worth of the pods still comes from abroad. It is said that the culture of Cocoa is an operation of considerable delicacy, and that after picking it requires extreme attention in the handling not to lose much of its colour and flavour. The quality of the Cocoa grown is excellent, but before it can be made an article of exportation it will be necessary to cultivate it on a large scale, and so to reduce its price by the use of labour-saving machinery as to enable it to compete with the Cocoa exported by Venezuela, Reunion, Ecuador, and Central America. The consumption of Chocolate, if not as a beverage at all events for confectionery purposes, is said to be steadily increasing in Europe and the United States; one of the great makers of "Chocolates" in the latter country declared recently that within the last five years he has increased his annual consumption from 24,000 to 50,000 bags.

DISEASE OF CELERY. PUCCINIA BULLATA.

CELERY is very liable to a disease caused by a fungus now generally known as Puccinia bullata. It is possible that some Celery growers may have had no experience of this ailment, but other growers, and especially during the present season, have seen every Celery plant fall rapidly into loathsome putridity from the attacks of the fungus before us. Puccinia bullata has been very rife this autumn and we know of more than one instance where every plant in a market garden has been completely swept off by it.

The accompanying illustration (fig. 149) will explain something of the habit of the pest. At A is shown, natural size, what should be one of the smaller leaflets of a Celery leaf, but the disease which is preying upon the leaf has caused it to distend itself to an abnormally large size; it is also thick and leathery in proportion to its superficial expanse. It is thickly covered all over on both sides with projecting black disease spots. At B is shown, also natural size, a fragment of the upper portion of the "stick" or leaf-stalk of the Celery plant blotted on both sides with disease spots identical with those seen on the leaves.

In an attempt to understand something of the nature of the disease a small piece should be cut from one of the leaves through the disease spots, and from this small piece a minute and very thin slice should be cut from the exposed surface. If magnified fifty diameters the transparent fragment, thus removed, will appear much as shown in the centre of the illustration, which has been engraved direct from Nature. At C the upper epidermis of the leaf is seen peeling away, or sloughing off from the flesh of the leaf. At D the lower epidermis is sloughing off in a similar fashion. At E, stomata, or organs of transpiration may be seen on the epidermis, which is peeling off; and at F, G, H, and J the fungus itself, or Puccinia, may be seen growing within the leaf, and bursting from within outwards. Everywhere amongst the constituent cells of the interior of the leaf the spawn or mycelial threads of the fungus may be seen. It is evident that a leaf so disorganised, with epiderm everywhere burst and cells abnormally swollen, can no longer perform its vital functions. As the "stick" or leaf-stalk is in an identical condition with the leaf the whole plant when badly attacked by the fungus must of necessity soon fall into putridity.

In its early stage of growth the red spores—Uredo spores—consist of a single cell as shown enlarged 400 diameters at K; these spores by germination rapidly and as soon as formed extend the disease. Later on,

spores of two cells—Puccinia spores, potentially resting spores—are produced as shown enlarged 400 diameters at L.

No Æcidium has yet been suggested for Puccinia bullata, although a good number of old species and synonyms as P. Apii, P. Conii, P. Æthuse, P. rubiginosa, P. Acethi, P. Silai, P. bullaria, &c., have of late been all rolled into the one before us. The Uredo condition also has at least six different names. All species of Puccinia found on umbelliferous plants are, however, not of necessity the P. bullata of Celery. Some men appear to do nothing but invent new names for fungi and parts of fungi; other men knock all the new names down (like nine pins) as soon as erected. Both sets of men think this child's play is Botany or Mycology, and become disturbed if they get laughed at as mere hucksters of hard words.

The Celery fungus is not confined to Celery, as it grows upon Parsley, Fool's Parsley, Seseli, L'eppe-Saxifrage, Silaus, Archangelica, Fennel, Hog Fennel, Peucedanum, Hemlock and other Umbelliferae.

The fungus should be destroyed in its early stages of growth as soon as seen, and a good look-out kept for any Puccinia-infected examples of the umbelliferous plants just mentioned. *Worthington G. Smith, Dunstable.*

HOME CORRESPONDENCE.

Wasps and their Habits.—Your correspondent, "F. W.," is wrong in stating "that there are never any of these hanging nests seen in the South of England." They are certainly not common, but far from uncommon. Only this last summer a very perfect nest was found suspended from a branch of a small *Aucuba japonica* in a pot, and formed an interesting exhibit at the Royal Southampton Horticultural show in August. The nest still remains intact on the plant, and is placed in a greenhouse for further preservation. It is about 4 inches in diameter, and a marvel of insect skill. Many nests of a similar character have frequently been found in this locality. Two years since one was found upon a small branch of a *Cedrus Deodara* on my lawn. There are several species of wasps in England. The one that suspends its nest to branches is different from the common too well known species which makes its nest within the ground. *W. H. R., Southampton.*

The Gardeners' Royal Benevolent Institution.—I am glad to see there is one gardener—Mr. Greenfield—who approves of the suggestion I made in favour of the above. As Mr. Greenfield says, the collection taking place in the Queen's Jubilee year "is almost sure to be a success." Mr. Greenfield's idea, that a good representative committee be chosen in the various districts is a capital one. Perhaps other gardeners will give their opinion, for now the ball is set rolling it is best to keep it going. I have been thinking whether it would not be best to partly re-name the above Institution by calling it the Royal Horticultural Benevolent Institution. It would then be more in character with the R.A.B.I. *J. Perkins.*

Severe Frost in East Anglia.—On the morning of the 2d and 3d, Thursday and Friday last, our thermometer registered 17° of frost, and on the 4th, 8°. We just managed to fill our ice-house. *J. Perkins, Thornham Hall.*

Adiantum Farleyense.—I believe it is very rarely that this beautiful Fern produces fertile fronds. I have availed myself of every opportunity to search for them, and have examined plants of all sizes, and those that have been grown under various conditions, but have never succeeded in finding any. Having expressed an opinion that it never produces fertile fronds, a friend of mine brought me a frond to convince me that it does. The frond which was given me was a very young one, and although there is some semblance of fertility, the spore cases are very imperfectly developed. I have some doubt if they would have developed sufficiently to bring spores to maturity. Enclosed find portion of frond. I shall be glad to know if you have seen well-developed fertile fronds. *A. Henry. (No. Eb.)*

I might have said when I wrote my query at p. 692, that I am of opinion that this seedling *Adiantum* might have been the product of a cross between *A. macrophyllum* and *scutum*. It is well known to cultivators of Ferns, that by sowing two or more varieties of the same species together, some very fine varieties have been obtained. Why should it not have been so in this case? If my memory serves me right, *Farleyense* was an importation from Jamaica, but as Mr. T. M. Shuttleworth says, it may still have been a hybrid. Has it ever been known

to come up in any stove that has never had an established plant of the true *Farleyense* in it, and where such varieties as *scutum*, &c., have been grown? If so, this would establish the fact of its being a hybrid. *W. G.*

Plants for Bees.—In answer to the inquiry of "T. B. S." (p. 729), apiarians having garden space, or suitable ground, will do well to avail themselves of the list of seeds of choice "bee plants" offered below, as we feel sure that their "take" of honey will be much improved both in quantity and quality. There are many other varieties beyond those we mention which are recommended as suitable for bees, but a long and careful observation at our seed garden confirms our opinion that those named may be considered the very best amongst annuals for the purpose, and, we may add, the most easily cultivated. With the exception of Mignonette, which should not be sown out-of-doors before April, all are quite hardy, and sown freely at intervals from early in March to the middle of June, will produce an abundant succession of bloom from May to October. *Gilias*, *Nemophila*, and *Linnæus*, Douglasi will bloom much earlier if sown in August or September in a sheltered spot, but the soil must not be freshly manured, or the plants will make too much growth to stand the winter:—*Borage*, *Clarkia pulchella*, *C. p. alba*, *Cyanus minor*, *Erysimum Peroffskianum*, *Gilia tricolor*, *G. t. alba*, *Linnæus Douglasi*, *Mignonette New Giant*, *Nemophila insignis*, *N. i. alba*, *Gnethora bistorta Veitchi*, and white Dutch Clover—splendid for bees, and producing the finest quality of honey. *Daniel Bralich.*

—In answer to "T. B. S." on bee plants, there is a little book on the above subject, written by Mr. H. Dobbie, of Cingleford, Norwich, published by Jarrold & Son, London and Norwich. Mr. Dobbie also supplies the seeds and plants. Messrs. Carter, of Holborn, have a special list of bee plants for the flower garden and kitchen garden. This list has been carefully selected and contains the very thing "T. B. S." requires, and will strongly advise him (or her) to apply for this list, and make a selection from it. *Walter Chitty, Peasey.*

Cape Woods.—It may interest your correspondent, Mr. D. Webster, as well as other readers of the *Gardeners' Chronicle*, to know that the Cape Boxwood referred to by him (p. 715, *Gardeners' Chronicle*, December 4) is furnished by the new species of *Buxus* recently described by Professor Oliver as *Buxus Macowani*, and an account of which I published in the *Journal of the Society of Arts* for March 19 last, p. 405. The Catalogue of Cape exhibits at the recent Colonial Exhibition, referring to this Boxwood, says:—"North-eastward of Bathurst are the more important forests of East London, containing the Boxwood recently brought to notice and not known to exist in any other forests in the colony." And again, in another place, it says:—"Its natural reproduction is very good. The seasoning of this wood has been under observation for little more than a year and appearances indicate that it will become one of the most valuable woods for cabinet work in the colony. When Cape Boxwood is better known in the English market it is anticipated that an export trade will be established. Small shipments have already been made to introduce the wood, which is very favourably reported on for engraving purposes. The *Timber Trades' Journal*, of August 22, 1885, states this wood to be one of the best woods yet put forward as a substitute for the ever decreasing supply of true Box. While on the subject of Boxwood it may be well to state that the *Kuepua Boxwood* or *Kamassi* (*Gonioma Kamassi*) has also attracted some attention of late as a substitute for Box, in consequence of which it is more strictly preserved in the forests than hitherto. Quoting again from the Cape Catalogue we find that a London firm of wood engravers thus report on this wood:—"Suitable for the finest mechanical engraving, such as machinery of all descriptions, also adapted for ordinary engraving purposes." This wood is stated to be considered by some as superior to the East London Boxwood, and it is anticipated that further trials will lead to an export trade in *Kamassi* wood. Good specimens of these woods, together with the fine plank of yellow wood referred to by Mr. Webster, have been presented by the Cape Commission to the Museum of the Royal Gardens, Kew. *John R. Jackson.*

Transmission of Seeds from the Tropics.—In the *Gardeners' Chronicle* for October 16, 1886, is a note from my friend, Mons. Thury, the Director of the Botanic Garden, Martique, in reference to the vitality of seeds in the tropics. I can fully confirm what Mons. Thury asserts, as, from an experience extending over eleven years, I have had frequent opportunities of testing the truth of the statements advanced. Many tropical seeds, especially Leguminous ones, also soon lose their vitality unless they are specially "fitted to survive" by possession of a hardened exterior coating—a fact occurring in Nature

which ought to show us the way to preserve seeds in these climates with success. Measures are now adopted by many of our leading seedsmen to hermetically seal all packages of seeds coming to the tropics, and this plan would be adopted by all without doubt did they know how the quality of these goods is depreciated by being kept for a few weeks in the paper bags in which they are often forwarded. *J. Hart, Acting Director, Botanical Department, Jamaica.*

Rose Lady Mary Fitzwilliam.—I am sorry that Mr. Henry Bennett feels aggrieved about my statement concerning that very beautiful Rose, Lady Mary Fitzwilliam, but I am equally sorry that I cannot retract what I have said. Mr. B. mentions its female parent, but what was its male parent?—that is the first point. But even if he crossed it with another Tea, there must have been some body, in the shape of bee, moth, or insect of some sort, beforehand. He announced "Her Majesty" as a cross between two H.P.'s, I believe, although I never happened to see his announcements; but it is anything but perpetual, and something must have interfered with the hybridising. I believe he acknowledges so much himself. For my statement that it is not a Tea I rely on the catalogues, and also on its habit of growth; in fact, whatever may have been its supposed parentage, it is as much a Tea as La France or Captain Christy, and I am convinced that if any exhibitor is weak enough to put it into a Tea stand he will inevitably be disqualified. *Wild Rose.*

Tobacco Culture and Harvesting.—In my notes on "Tobacco Culture in North Wales" I promised later on to let you know the final results—in other words, how the Tobacco turned out. After repeated and fair trials on the part of persons well competent to judge, I must say that the result is almost everything that could be desired, the Tobacco smoking pleasantly and well, but, of course, being to a great extent destitute of the rich aroma that is so characteristic of the finer and more expensive brands. This, however, can only be imparted to it by, as stated in the notes on Messrs. Carter's crop, subjecting it to the necessary process of fermentation or curing for aroma and flavour. From Carlisle southwards it is now quite evident that Tobacco culture is a branch of industry well suited for the British farmer, and if such success as that generally reported has attended the culture and harvesting of it in a season like the present, which for sunniness and excessive rainfall is almost unprecedented, what further success may we not expect during even an ordinary English summer? It now rests entirely with Government to grant favourable terms for Tobacco culture, when there is but little doubt hundreds would turn their attention to so easily managed and profitable a crop, more particularly at a time like the present, when, do as they will, farmers cannot make, even with the most frugal and expert management, the ordinary farm produce give even a remunerative return. The value of Tobacco culture for an ordinary farmer is very much enhanced by the fact that the final curing or imparting of the pleasant aroma is not necessarily required to be engaged in by him, for the raw or unmanufactured crop finds a ready market at 6d. or 8d. per pound, and as, according to Messrs. Carter's experiments, 15 cwt. can be produced on three quarters of an acre of ordinary farming land, the grand total of nearly £75 to the acre, although startling, is in reality a fact that actual experiments, conducted by one of our leading nursery firms, and under the very eyes of the Excise authorities, fully bear out. Even although a fair taxation is levied on British grown Tobacco, and due allowance made for the impoverishing nature of the crop, there would still be a handsome margin of profit left for the person who most deserves it—the cultivator. *A. D. Webster, Llandegai, Bangor, North Wales.*

Potatos for Salad.—We are so accustomed to eat the tubers of this plant in a warm condition that we lose sight of the fact that on the continent of Europe—where, indeed, the root does not happily form the chief vegetable at any one's table—the Potato is very commonly eaten cold, cut up in slices, just as we serve the Cucumber, and oil, vinegar, and other condiments are added. It is seldom consumed by itself, sliced Celeric or Beetroot being usually mixed with it. For this particular use long kidney-shaped varieties with a close firm texture, are chosen, our floury kinds being unsuited owing to their crumbling nature. *X.*

Horticultural Exhibitions.—Once again the exhibitions for the year may be said to be over, and members of committee are holding meetings to arrange schedules for the coming year. I have been connected more or less with horticultural exhibitions of all sorts and sizes, from judging at International to taking the gate money at a cottager's show, so that my acquaintance with the subject ranges over

many years, and I am tolerably conversant with everything in the show way; and this I have great pleasure in saying, that gardeners as a class are honourable and straightforward, but in this, as in everything else, there are exceptions, some exhibitors sometimes placing on the tables articles not of their own growing. Now this in my judgment should not be; all exhibits ought to be the growth of or have been in the possession of the exhibitor two months previously, because if one has only sufficient friends there is no difficulty in taking high honours when this rule is systematically disregarded. It is grievous when one is giving, say, a 1st prize to a collection of fruit to see, it may be, a Pine-apple or a Melon which from their appearance makes one wonder if they have not done duty elsewhere; or perhaps a prize is offered in August for Peas, and one comes to a fine dish of Williams' Bon Chrétien, but their appearance gives one the idea that they were

can be met with as my brother gardeners. *J. Rust, Erleigh Castle.*

Eupatorium Weinmannianum.—As we are having it in quantity just now, both for plant furnishing and cut flowers, it may not be out of place to make a few remarks about it. I do not know of anything at this time of year that gives equal returns for labour expended. It deserves a place in the garden of the amateur and cottager, as well as in more extensive gardens. It has nice heads of flower that are first white, then turn a very light pink, having a fine fragrance resembling that of the Meadow Sweet. As a cut flower it endures about a week, except in cases where the vases are near to the heat of the room fire or lamps. It is planted outside all summer and autumn, where it grows well, and sets its flowers freely, being taken up some time in September according to the weather, and potted. Our smallest sizes are in 3-inch and the largest in 7-inch pots. By lifting it with a small ball there is no perceptible check observed, if it be kept in a temperature of from 40° to 50°; under this treatment it comes into flower about the first week of December. We have had it in flower since the second week of November, but these were forced plants. Those standing in cold pits look as vigorous as the others, and will come into use later, making a good succession. Judging by the manner in which the plants keep in unheated pits, I should not hesitate to keep them out-of-doors for a considerable portion of the year in the mild parts of the kingdom. *J. U., Skibo Gardens.*

Pruning and Switching Hedges.—I would ask whether there is any difference in the constitution or other circumstances surrounding trees, whether growing in hedges or in plantations or forests, that should cause different seasons to be considered most favourable for pruning them respectively? As to hedges Mr. Grier (in his prize essay on fences, *Journal of the Royal Agricultural Society of England*, 1st series, vol. vi., p. 214) directs "If a hedge is not vigorous, and an increase of strength be desirable, pruning should be performed during the latter part of October, because the sap and sustenance which the roots attract from the earth during the winter will go on to the remaining branches, causing them to push next spring with unusual vigour." The late Professor Low, of Edinburgh University, in his *Elements of Practical Agriculture*, writes, p. 742, "in all cases of pruning the proper season is when vegetation is inert, and not when the sap is ascending." Again, p. 782, "This (November) is the fitting season for pruning hedges and performing other operations upon the live fence." The *Highway Act*, 5 and 6 Will. IV., c. 50, s. 66, enacts "No person shall be compelled, nor any surveyor permitted, to cut or prune any hedge at any other time than between the last day of September and the last day of March." Thus far as to pruning hedges; as to Forest tree, Mr. Brown in *The Forester*, 3d ed., p. 419, writes, "All pruning operations should be done in the spring or summer months, observing to leave all Maples till the summer season. I would not advise to prune after August 1, for after that time the motion of the sap becomes slower, and the wounds are consequently longer in healing up. I observe that those trees which were pruned in May or June heal up in their wounds much faster than those done in July or a week in August. My impression therefore, is, that the month of June is to be preferred to any other month in the year for this operation." It is remarkable that the season recommended to agriculturalists for the pruning operations of the hedge, to which season, permission to the parish surveyor to prune such hedges as have been neglected by the owner is restricted by statute, is precisely the season during which *The Forester* advises that no pruning should be done. It may be that the arrangements for other operations on the farm may make it more convenient to prune the hedges in October, or in some of the months intervening between October and the following March; but leaving that consideration out of the question, and regarding only the health of the trees, I would ask whether the time for pruning that has been found best to suit the health of forest trees is not likely to be found equally favourable to the same operation on hedges? *Dist.* [We should not object to summer pruning as tending to restrict root extension, although it does favour the healing of cut surfaces. When important limbs must be amputated from large trees, there is the best of reasons for performing it in the season when the sap is active. No bad results have been noted from the use of the shears or the switch-knife on deciduous plants in the period from September to February, provided the work be performed in mild weather. Ed.]

Pteris tremula var. grandiceps.—A very distinct and elegant variety of one of the most useful Ferns for general decorative purposes. It is of a dwarf and more compact habit of growth than is the normal form of *P. tremula*; the pinnae are narrower, the fronds terminate in a tasselled crest of multifid growths; the side pinnae are also lightly crested, the

FIG. 149.—CELERIC FUNGUS: PUCCINIA BULLATA (SEE P. 756)

grown over the water, and only perhaps bought the day before in a first-class fruiterer's. This surely is wrong, because if such practices are allowed, it is a case of the long purse winning, and not cultural skill. A manager of a show not 20 miles from London said when I spoke to him on this subject, "We don't care a rush, provided we get a good show." I consider this mode of conducting a show to be very dissimilar to young exhibitors, and often causes their heartening to grumble at their want of success. I need not mention that it is of vital importance that there should be good judges. Of course, it matters not at all to those who kindly send "not for competition." I have no motive in writing this beyond a true love for our profession, for one is deeply grieved to see a falling off of both exhibitors and visitors at nearly every show in the country, and it behoves us to do all that in us lies to keep the bark afloat, for to do all that refining an influence on our people generally as a good horticultural show? and which affords a holiday to as praiseworthy a class of men as

terminal crest bearing the fronds down, and giving them a gracefully arched appearance. Plants of this variety were exhibited at South Kensington on October 26 last by Mr. H. B. May, of Edmonton, by whom it was raised. *A. H.*

Chrysanthemums at Truelveys, Ingestone.—The public shows now being over one month in time to look round a bit at what may be called the private shows, and one of the least certainly that I have seen is in the gardens of E. Caldecott, Esq. When I arrived there I found a very pretty place situated on a hill, the grounds of which are laid out very tastefully, and well kept up. The object of my visit, however, was to see the Chrysanthemums, and I was most gratified at what I saw. Mr. Harris, Mr. Caldecott's gardener, deserves high praise, both for the judicious selection as well as for the excellent cultivation and general condition of his plants. He is well to the fore also in new varieties, incurred and Japanese, whilst at the same time not forgetting the older but not less beautiful kinds. There were certainly some hundreds of plants in full bloom in the finest condition when I was there, all showing that Mr. Harris would be a formidable competitor at any show, some of his blooms being quite equal to many of the prize-winners at the Crystal Palace or Aquarium. I may also mention that the Chrysanthemum does not absorb all Mr. Harris' care, for he is a good all-round man, his stove and greenhouse plants, Grapes, &c., being most excellent. *J. Wright, Middle Temple Gardens.*

Gaultheria procumbens.—I do not know whether this plant has ever been suggested as an edging for a border, I tried a year ago at Oakwood round a bed containing principally deciduous plants and now at this dead season the bright red berries and glossy green leaves have a very pretty effect. It was struck by the frost-resisting power of a Veronica with narrow leaves and white flowers, which I have as *V. salicifolia*, but which a good authority tells me is wrongly named. The thermometer at Oakwood last night went down to 23° Fahr., yet I could cut sprays from plants in full exposure, perfectly untouched. The narrow leaves and feathery white flowers made a useful addition to a table nosegay chiefly consisting of *Perceyas* with light coloured berries and the open seed-pods of *Iris foetidissima*, both very pretty but rather solid. *George F. Wilson.*

Reports of Societies.

ROYAL HORTICULTURAL:

Tuesday, Dec. 7.

The small meeting, terminating the public doings of this Society in 1886, took place in a room of the Albert Hall, on the date given.

But few objects of any kind greeted the visitor, but amongst the few were some excellent examples of Pine-apples, a few Orchids, Aroids, Chrysanthemums, and winter flowering Carnations.

Scientific Committee.

Present: Dr. M. T. Masters, F.R.S., in the chair; Mr. W. G. Smith, M. G. Maw, Professor Church, Mr. O'Brien, Mr. Bennett, Mr. Michael, Mr. G. F. Wilson, Mr. McLachlan, Hon. and Rev. T. Boscawen, and Rev. G. Henslow.

VERONICA SALICIFOLIA.

Mr. Wilson exhibited sprays from this New Zealand species grown at Wisley which had perfectly withstood a temperature of 15° in exposed situations. He described it as seeding itself very freely. *Choisya ternata* was, however, cut by the same degree of cold.

JASMINUM ODORATISSIMUM.

A yellow species, exhibited by Mr. O'Brien, is said to be a native of Madira; but being of an Indian type, it was suggested by him, and corroborated by Mr. Maw, that it had been introduced there. He also exhibited flowers of *Coryanthes speciosa* var., from Major Lundy; *Maxillaria cucullata*, and a *Pleurothallis*, suggested by Mr. Kiddle to be near *P. ophicephala*.

MASDEVALLIA WITH LARVA.

Mr. O'Brien also exhibited specimens of a species of *Masdevallia* attacked by the larva of some Noctua.

NIPHON RETICULATUM, DISEASED.

Mr. Maw showed specimens which were referred to Mr. Murray for examination and report.

NARCISSUS, PHOTOGRAPHS OF.

Mr. George Maw exhibited photographs of living *Narcissi* made in the Riviera in 1870. He afterwards

gave a short account of the North African and South Spanish *Narcissi* observed by him in a journey made lately thither. *N. papyraceus* extends as far as Fez in Morocco, south of which N. sub-Broussoneti takes its place, extending from Saffi to Mogador. Allusion was made to the smallest of the white forms of *N. Tazetta* in the island of Teneriffe. Of the autumnal species reference was made to *N. vidiiflorus*, which had been lost sight of for half a century, but which Mr. Maw rediscovered in 1883 in the neighbourhood of Gibraltar, and again lately near Tangier. A hybrid between *N. vidiiflorus* and *N. serotinus* was found by him near Gibraltar, and a series of hybrids between *N. vidiiflorus* and *N. elegans* were got in North Morocco. Mr. Maw observed that *N. serotinus* was limited to the South of Spain, and *N. elegans* to the Morocco coast; the latter plant bearing true leaves. The *N. vidiiflorus* and *N. serotinus* he considers leafless, the scape appearing without leaves, and what seem leaf-organs he assumes are flowerless scapes. Mr. Maw also referred to the abundance of a small *Amaryllid*, *Tapeinanthus humilis*, Herbert (= *Pancratium humile*, Cav.), about 8 miles south of Tangier, and which he collected both in flower and fruit.

FARFELIA ESCULENTA. (SEE FIG. 150.)

Mr. Maw showed specimens of this so called "Manna," an edible lichen found in little rounded masses on the surface of the soil and obtained from the country about 100 miles south of Algiers.

ARAUCARIA ECERLSA.

Mr. Maw exhibited leaves attacked by a form of mealy-bug, which first appeared in consequence of the heat and moisture on board ship on the voyage from Bombay.

A vote of thanks was given to Mr. Maw for his interesting communications.

FIG. 150.—*FARFELIA ESCULENTA* (THE EDIBLE LICHEN).

EARLY LINEN PAPER.

Professor Church exhibited specimens of the earliest known linen paper made in Europe. It was a portion of an episcopal register of 1273, from Auvergne; another, dated 1289, consisted of entries of revenues, in which some of the original rag could be detected. It consisted of six strands of warp, and six of woof. The size used was entirely starch, which appeared to be from Wheat. The earliest authentic linen hitherto known is from a memorandum of the fourteenth century, now in the British Museum. The Moors are said to have made linen paper in the thirteenth century, all earlier paper being made of cotton.

VARIEGATED FOLIAGE.

Professor Church described some analyses he had made of Oak foliage, taken from a tree at Kew Gardens, which bore one albino branch, about 20 feet from the ground. A full account will be found in the December number of the *Journal of the Chemical Society*, 1886. The following is the analysis:—

	Albino Foliage.	Green Foliage.
Water	73	58
Organic matter	24	40
Ash	2.7	1.6
Potash	50	29
Iron	0.82	1.2
Phosphoric acid (same in both)		
Lime	8.25	24.5
Manganese	2.1	2.16

He found starch, but no dextrine in the green spots on the variegated leaves; but erythro dextrine in the white parts, probably derived from the green by migration.

SEAKALE WITH SCLEROTIA.

Mr. W. G. Smith exhibited specimens in which large oval black bodies were attached to the stems. The fungus to which they belonged could not be determined from them in that condition.

PREHISTORIC WHEAT.

He also read a communication upon and exhibited several specimens of carbonised Wheat from Salisbury and elsewhere, to show the comparative sizes of these ancient grasses and of average English Wheat; while those regarded as Romano-British appeared to be somewhat smaller, others were quite equal in size to living kinds, as also are those derived from the tombs of Thebes in Egypt. [We shall shortly give an illustration of this. *Ed.*]

FUCHSIA WITH PETALIFEROUS SEALS.

Mr. Henslow exhibited a specimen of a semi-double Fuchsia remarkable for its thick red sepals bearing small dark purple petals at their very apex. He suggested as an interpretation of this unusual occurrence, that the fibro-vascular cord of the petals had become fused with the midrib of the sepal, so that instead of the petal being produced at the normal position it had become carried up, somewhat as are the anthers in *Primroses*, the filaments of which, or rather their vascular cords, are combined with those of the petals to which they adhere, and are superposed.

Floral Committee.

Present: G. F. Wilson, Esq., F.R.S., in the chair; and Messrs. W. Wilcox, J. Laing, H. Herbst, H. Bennett, T. Baines, R. Dean, J. Walker, J. Hudson, W. Holmes, H. Cannell, G. Duffield, C. Nott, H. Ballantyne, W. E. Kellock, J. Daming, H. M. Flett, Major Lundy, E. Hull, H. Turner, J. O'Brien, H. Low, J. Douglas, and G. Paul.

The pretty dwarf white *Narcissus monophyllus* was shown by Mr. T. S. Ware; the neat habit and beautiful, almost translucent flowers make this rare bulb a desirable subject for the winter flora. Other plants shown from the Tottenham Nursery were an improved form of *Heliborus niger*, maximus, with an abundance of flowers, white interior and pistil, and the reverse of the sepals—its chief merit lies in the larger blooms and their profusion; *Primula obovata*, in bloom; a small piece of the rare *Cypripedium macranthum* bearing one flower; and a yellow sport from *Chrysanthemum Ehel*, named Mrs. H. J. Jones—it has straight flat broad florets, and is of a clear yellow hue.

Mr. G. Stevens, St. John's Nursery, Putney, exhibited a salmon and yellow Japanese *Chrysanthemum*, *Carex Underwood*, that has in it the making of a flower of some merit.

Another *Chrysanthemum*, this time from Guernsey, named Governor of Guernsey, was exhibited by Messrs. C. Smith & Son, Caledonian Nursery, Guernsey; it was of a fine yellow colour, and belonged to the incurved section.

Mr. G. F. Wilson showed a flower-spike of *Veronica angustifolia*, which having withstood 15° of cold in an exposed spot at Wisley, was held by him to be a plant of mark. How it would behave with a greater degree of cold is a matter for further proof. The flowers are white, and the habit of the plant and size of the foliage is slender.

A solitary cut bloom of *Amaryllis equestris*, with crimson petals, the throat being green-coloured for half its depth, came from Mr. W. Smythe, gr. at Basing Park, Alton.

Mr. Hns Niemand, of the Royal Nursery, Harbottle Road, Birmingham, exhibited *Poinsettia pulcherrima variegata*, the claim to merit lying in the creamy-white blotched foliage.

A plant of *Cypripedium calceolus* in bloom was shown by Mr. W. Bull, New Plant Nursery, King's Road; the flower was large and well developed, showing the bold distinct markings of the various parts to perfection. The dorsal sepal is the finest feature, it being broadly marked with deep purple radiating lines, and the upper margin ornamented by a white margin of half an inch in width.

Mr. F. J. Paul, gr. to J. C. Bowring, Esq., Forest Farm, Windsor, showed a seedling *Cypripedium* × *C. villosum* and *linearis* intermedium. It did not appear to possess sufficient distinctness to be of much interest, the flowers being precisely those of *insigne*. The habit is dwarf, and the flowers are much varnished in appearance.

From that rising garden, Suddley House, Hammersmith, Mr. J. C. Cowley, gr. to F. G. Tautz, Esq., sent *Anturium Tautzianum*, another plant wanting in distinctness from existing varieties; and *Spathoglottis Augustorum*, a plant bearing a few pale mauve Calanthe-like blooms on a long flower-stalk.

A handsome *Nerine*, supposed to be × *coruxa* major and *hexosa*, came from Mr. E. Peters, gr. to J. L. Mansell, 2, Somerset Terrace, Guernsey. The large cyme is composed of flowers of a rosy-crimson colour.

The gr. to C. J. Partington, Esq., Mr. B. Searage, Heaton House, Chesington, contributed a very fine *Odonoglossum crispum*, the spike being of an extraordinary size, and the flowers the pink of perfection.

Mr. H. Heins, gr. to F. A. Philbrick, Esq., Oldfield, Bickley, exhibited *Laelia anceps* *virginalis* bearing two flowers of the purest white, and of evidently great sub stitance, promising long endurance either cut or on the plant. This is doubtless the most entirely white variety of *L. anceps* in existence.

Mr. E. Marzin, East Field Nursery, Mitcham, showed the yellow *Chrysanthemum* Mrs. N. Davis, an incurved variety.

Some excellent heads of bloom of zonal *Pelargoniums* were shown by Messrs. H. Cannell & Sons, Home Farm, Flowers, Swanley, and were so fine for the season as to secure a Cultural Commendation.

A very strong growing *Calla æthiopica* was shown by Mr. J. King, Rowshan, Aylesbury; a fine crimson *Primula sinensis*, Lord Wolsely, coming from the same place.

Messrs. Hooper & Co., Covent Garden, had a hamperful of winter-flowering *Carnations*, consisting of most of the most admired kinds.

Fruit Committee.

Present: H. J. Veitch, in the chair; and Messrs: J. Burnett, W. Warren, J. Woodbridge, G. T. Miles, S. Ford, Harrison Weir, J. Smith, T. B. Heywood, F. Mason, G. Norman, C. Ross, F. Rutland, W. Denning, R. D. Blackmore, W. Paul, R. Hogg, G. Buxnard, P. Crowley.

An apparently fine robust *Celery*, Veitch's Standard Bearer, was exhibited by Mr. W. K. Strong, gr., Wellington College; it was insufficiently blanched.

Mr. J. Harris, gr. to Mrs. Vivian, Singleton, Swansea, showed six *Fineapple* of the Charlotte Rothschild and Smith's Cayenne kinds; these were of good finish and size, but were much excelled by three fruits of the latter kind from Mr. T. Coombes, of the Hendre Gardens, Monmouthshire.

Seedling Apples were shown by several persons, but which the committee failed to prove worthy of retention.

THE LINNEAN SOCIETY: Dec. 2.

CEYLON PLANTS.—As a chapter in the history of East Indian botany, Dr. Henry Trimen gave an account at the Linnean Society meeting, on the above date, entitled "Hermann's *Ceylon* (Herbarium and Linnaeus' *Flora Zeylanica*)." The collection of dried plants and the drawings of living ones made in Ceylon by Paul Hermann in the latter half of the seventeenth century possess a special interest as being the first important instalment of material towards a knowledge of the botany of the East Indies; but Hermann himself, who died in 1697, published very little of this material. Some of his MSS. were subsequently printed by W. Sherard, including a catalogue of the herbarium as then existing, under the title of *Museum Zeylanicum* (1717). This herbarium was lost sight of till 1744 when it was recognised by Linnaeus in a collection sent to him from Copenhagen. After two years work at it, Linnaeus produced in 1747 his *Flora Zeylanica*, in which all the plants that he could determine are arranged under his genera. At this date Linnaeus had not initiated his binomial system of nomenclature, but in his subsequent systematic works he quoted the members of the *Flora Zeylanica*, and thus Hermann's specimens became the types of a number of Linnaeus' species, for the most part additional to those in his own herbarium now in the possession of the Linnean Society. Hermann's herbarium is now in the botanical department of the British Museum, having been purchased by Sir Joseph Banks, from Professor Treschow, of Copenhagen; the specimens are in very fine preservation, but some were originally scanty or imperfect. The paper consists of the results of a critical examination of the whole of the collection, and a catalogue is given of all the *Flora Zeylanica* species as named by Linnaeus, along with the determinations of Hermann's species of each as now identified. Not a few difficulties, ambiguities, and misapprehensions of Linnaeus' species have been thus recovered and cleared up, and the most important of these are discussed in a series of short, critical notes which form the conclusion of the paper.

NATIONAL CHRYSANTHEMUM; Dec. 8.

A MEETING of the Floral Committee of this Society took place at the Royal Aquarium on Wednesday, and considering the lateness of the season, a good number of *Chrysanthemums* were staged. Only one First-class Certificate of Merit was awarded—to Japanese White Ceres, so named because it is considered to be a sport from the old type under that name; a flower of a delicate bluish tint, but so different in build are the flowers that it seems scarcely possible that one can be a sport from the other. Mr. N. Davis stated that he had always had the bluish form and in the name of Ceres; others said they had the white one; but the balance of opinion inclined to the opinion that the two were essentially distinct, and it was thought best to name it White Ceres.

A dozen grand flowers were shown by Mr. Beckett, Aldeham Park Gardens, Elstree, large, full, fringed, broad petalled, pure white flowers of great beauty. Some blooms of the delicate pink form were also shown. Mr. Beckett also had Japanese Prince Leopold, the flowers reflexed, the bases cinnamon and gold, the centre golden amber; a little confused, and

scarcely up to exhibition form, but promising. (Commended.) Also a singular looking pompon, named Kyrle Bellew, orange-brown, thread-like petals, the reverse globe-buff.

From Mr. E. Owen, nurseryman, Maidenhead, came a number of good blooms, which, however, received no award.

To a collection of cut blooms from Mr. Beckett a vote of thanks was awarded.

Other exhibits came from Mr. Smith, Caledonian Nursery, Guernsey; Mr. Bittesworth, Cheshunt; Messrs. Henry Cannell & Sons, nurserymen, Swanley; Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, who had Mrs. H. J. Jones, a golden sport from Ebel, valuable on account of its late blooming; Mr. G. Stevens, St. John's Nursery, Putney.

ROYAL CALEDONIAN HORTICULTURAL.

THE annual meeting of this Society was held in Edinburgh on the 3d inst., Mr. John Downie presiding. After the usual preliminary business, the Treasurer read a statement of the finances of the Society for the past year, which showed that the receipts amounted to £1140 14s. 11½d., and the payments to £1101 12s. 2½d., showing a balance in favour of the Society of £39 13s. 9½d. on the year's transactions. The total funds of the Society amounted to £1037 17s. 10½d., being an increase of £35 0s. 2d. during the past year. The accounts submitted having been duly audited by A. Davidson Smith, chartered accountant, were unanimously approved. The Marquis of Lothian was re-elected President; the Duke of Buccleuch, Earl of Stair, and Earl Rosebery, were re-elected Vice-Presidents, and Sir Thomas Clark, Bart., Lord Provost of Edinburgh, was elected in room of one retiring, Messrs. Alexander Milne (Messrs. Dickson & Sons, nurserymen), and John Paterson, gr., Millbank, were elected councillors in the place of two retiring by rotation. The Secretary, John Stewart, Esq., W.S.; Treasurer, P. Neill Fraser, Esq., Rockville; and the auditor, J. D. Smith, Esq., C.A., were duly confirmed in their respective offices. The Secretary then intimated that it had been arranged between the Council of the Society and the National Rose Society of England to hold a grand Rose show in connection with the usual summer show which is to be held on July 13, 1887, in the Waverley Market, when it is expected that the leading growers of Roses in the United Kingdom will send contributions and compete in the open classes. Gold and silver cups are to be exhibited for the leading Rose competition, and the Council have already received intimation from several gentlemen of their intention to present each a cup. From the fact that the National Rose Society is the most important society of the kind in this country, and that this is the first show under its auspices held in Scotland, it is sure to cause a considerable stir in the horticultural world, and be one of the great attractions at Edinburgh during the Jubilee Year.

Scotman.

ABERDEEN CHRYSANTHEMUM SHOW.

THE annual winter show of *Chrysanthemums*, held under the auspices of the North of Scotland Horticultural Society, was opened in the Music Hall Buildings, Aberdeen, on Friday, the 3d inst., and continued until Saturday evening, the 4th inst. This is the fourth display of the kind which has been promoted by the Society. This year the show was in many respects superior to any of its predecessors. Compared with last year's exhibition the entries were much about the same, but there was a decided improvement in the quality of the exhibits, indicating that advances are being made in the cultivation of this flower in Aberdeenshire. The past season has been regarded as being very favourable for the growing of *Chrysanthemums*, with the consequence that the exhibition of Friday and Saturday was more satisfactory than was the case last year. The distinguishing feature of the collection was the cut blooms, of which there were some exceptionally fine specimens brought forward; and there was also shown a number of *Primulas* and *Ferax* which reflected great credit on the growers. Japanese varieties of *Chrysanthemums* were exceptionally good, while *Chrysanthemum* Bouquet has never been shown here in greater numbers, or in better bloom.

Pot plants were few in number, and this was said to be due to the inclemency of the weather, many intending exhibitors having decided not to forward their specimens, in case they might get nipped with the frost. Mr. Ogg, Morken, had an easy 1st in most of the classes for professional gardeners, while Mr. A. Grove, Fairfield, Mr. W. Scobie, Forester Hill; and Mr. G. Grigor, Sunnybank, gave a good account of themselves. In the amateur classes Mr. James McInty, Mr. A. Gillespie, and Mr. J. R. Whyte, all of Aberdeen, shared the principal honours.

Mr. Ogg, Morken, sent for exhibition a capital lot

of *Primulas*. A very creditable box of *Chrysanthemums* was also, for the same purpose, sent by Mr. Peter Harper, Duthie Public Park, Aberdeen; and another box of the same flower, which was deservedly very highly commended, was sent by Mr. M'Leod, Ardmiddle.

Messrs. W. Smith & Son, nurserymen, Aberdeen, sent for exhibition a stand of *Draecenas*, *Palms*, &c. Ferns, in both the professional and amateur classes, were as creditable a display as could be looked for.

BANBURY SHOW.

At the Exchange Hall a good show of *Chrysanthemums* and other autumn flowers took place on the 24th ult., groups, pot plants, and cut flowers being of considerable merit. Fruit was likewise in abundance; but Onions of various kinds, which have become special subjects of cultivation at Banbury, were of extraordinary quality and weight.

The 1st prize for the best twelve was awarded to Mr. Neal, Hampton, for a dozen extraordinary bulbs of the Anglo White Spanish variety, scaling 63 lb.; Mr. Doherty, gr. at Wroxton Abbey, being awarded 2d honours, for twelve of the famous Kousham Park Hero.

For the best six, Mr. Wingrove carried all before him, with marvellous bulbs of the Kousham Park Hero, weighing 5½ lb.; Mr. Slarke, gr. to the Earl of Ellesmere, being awarded the 2d prize, for Anglo White Spanish, weighing 7½ lb.

Mr. Deyverill, of the Royal Seed Stores, Banbury, staged a grand collection of his new Onions, not for competition, including the Jubilee and the Ailsa Craig, both distinct, and of fine shape and quality.

SMITHFIELD CLUB SHOW.

THE annual exhibition of this Club has come to be regarded by Londoners and their country cousins as being of as certain recurrence as the Lord Mayor's Show or a Bank Holiday.

The present show at Islington exhibits all the various items that have for years appeared there, serving to mark the progress made in agriculture; and for the delectation of the general public; the same fat oxen, pigs, and sheep inside the building, to be rivalled on the other side of the way by still fatter specimens of humanity in the show booths.

The great seed establishments of Messrs. Carter & Co., Sutton & Sons, Webb & Son, Harrison & Son, Kaynbird, Caldecott & Co., and several more, exhibited roots of all kinds, growing grasses, cereals, seeds, both farm and garden, and the other different articles that go to make an exhibition on a large scale.

Roots were particularly fine and clean, especially Mangel Wurzel, Swedes, and Belgian Carrots.

The novelty of the season, seen in the stands of Messrs. Carter & Co., Messrs. Sutton & Sons, and Webb & Sons, was home-grown Tobacco, in leaf, as cured, and also cut up ready for smoking. If the flavour of the weed should equal its excellent appearance, the successful cultivation of the plant in this country has become an accomplished fact.

The Commissioners to the late Colonial Exhibition had a stand artistically got up with cereals and prairie grasses, exhibiting the varied productions of the farm and garden in the north-west province of Canada. Amongst these were Potatoes of this season's growth, the kinds being such as are well known here, but which had grown to such large proportions as to be hardly recognisable.

Mr. Kerr, of Dumfries, showed an extensive collection of Potatoes suited to Scotland—very fair, usable tubers.

The Horticultural and Agricultural Company made a fine display with roots, cake, and meal, for feeding stock in artificial manures, &c.

Enslilage was in abundance, the peculiar pungent odour of the stuff forcing one's attention to it.

FRUIT REGISTER.

KAISHA APRICOT.

A SYRIAN variety, introduced into this country in 1842 by Messrs. VEITCH, then of Exeter. The fruit is of excellent quality, medium size, slightly downy, pale yellow, passing into dull orange, reddish on the exposed side. Flesh yellow, translucent, sugary, perfumed. A coloured figure is given in the last number of the *Bulletin d'Arboriculture*.

AMERICAN APPLES versus BRITISH GROWN.

Are American Apples superior or not to those produced in our own country? I think it is generally believed that the Americans are ahead of us in Apple culture, but I would like to have the statement verified or not by those competent to judge. A. D. W.

SCOTLAND.

CHRYSANTHEMUM SHOW OF THE SCOTTISH HORTICULTURAL ASSOCIATION.

THE Scottish Horticultural Association opened the first show that has been held under its auspices on the 7th inst., in Dowell's Rooms, Edinburgh. It was opened by the Lord Provost, Sir James Clark, Bart., who, in an appreciative speech, showed that he knew and admired the Chrysanthemum, and thanked the Association for its intelligent enterprise in general in the interests of horticulture, and particularly for coming forward in the interests of gardeners and the public on this occasion. This is a new departure for the Scottish Horticultural Association, whose function is rather the fostering of the literary than the exemplary agencies that tend to the advancement of horticulture in the North. But it has been forced upon them by the attitude of the Royal Caledonian Horticultural Society. That Society, considering that it had lost a considerable sum by its Apple Congress in November last year—in connection with which it made its first attempt at holding a Chrysanthemum show—decided to have nothing further to do with Chrysanthemum shows. That the Society lost money by that venture there is no doubt; but that it was due to the Chrysanthemum element that was thrown into it for the first two days of the six during which it lasted, is not quite so undoubted. At any rate the Society declined to hold a Chrysanthemum show this year, notwithstanding urgent appeals to do so. The Scottish Horticultural Association was approached on the subject, only six weeks ago, by local and distant lovers of the Chrysanthemum, and the Council of the Association agreed to issue a schedule at once. This appeal was responded to beyond their expectations alike in the numbers and the quality of the exhibits sent in. Over 130 entries were received and many exhibits were declined in consequence of the limited space at the disposal of the Council. The show considering the very short time that has elapsed since it was decided upon, may be pronounced a success, and will, we hope, lead to a continuance annually of like meetings with increasing success—a consummation which will be assured if the same energy is brought to bear on future occasions as has been exerted on this.

Plants were numerous, but evidently brought forward without any preparation for exhibition purposes. They were on the whole well-bloomed, but in the main they were more remarkable for the numbers than the size and high culture of the flowers.

PLANTS.

Following the schedules, the best six pots, large flowered sorts, came from Mr. McHattie, Newbattle, Dalkeith; and the 2d prize lot from Mr. Cockburn, Coltbridge Hall. In the class of three pots of large flowered varieties, Mr. McHattie again took the lead, with Mr. D. Jardine, Ravelston, a good 2d. In single pots of the same class, Mr. J. Cowan, Dunedin House, was 1st, and Mr. D. Jardine, 2d. Six pompons were well shown by Mr. Foote, Parson's Green, who had no competitor; three pots pompons were competed for by Mr. J. Cowan and Mr. D. Jardine, and others. The gentlemen named took the honours in their order. For the prize offered for one pot pompon there were several competitors, the prizes being taken by Mr. McHattie and Mr. Dougal, Talbot House, respectively.

CUT FLOWERS

There was a considerable display of these. It may be remarked that some little confusion appeared to have possessed some of the exhibitors in regard to the definitions Japanese and reflexed, these two classes being considerably "mixed" in nearly every stand in each of the two classes. The 1st prize in the class of twelve incurved was awarded to Mr. McHattie, his stand including enormous and well finished blooms of Golden Queen, Mrs. G. Rundle, and Isabella Bland. Mr. Carruthers, Hillwood, Corstorphine, made a very good 2d with a much more equal lot, including beautiful flowers of Lord Alcester, Golden Empress, and Mrs. Dixon. With twelve Japanese blooms Mr. Carruthers was an easy 1st, his stand comprising very fine samples of Criterion, Marguerite Marrouch, Source d'Or, Madame Rendatler, and others; and was followed by Mr. McHattie, with a very good

stand, containing a few enormous flowers, but not equal throughout, which had no doubt decided the judges in passing over the merits of the few grand blooms set up by this exhibitor.

In the class for six incurved Mr. Carruthers again took 1st prize, and Mr. Durward 2d.

Mr. Rushton, Clerewood, Corstorphine, took 1st prize in the class of twelve reflexed blooms, with a very meritorious lot; Mr. J. Carruthers being 2d.

Pompons were a poor show, the best twelve coming from Mr. J. Durward.

Of bunches of six blooms in three sorts there was rather a large display, the best being set up by Mr. R. Muirhead, Edinburgh; and the second best by Mr. J. Durward.

Mr. Muir, gr. to Miss Nesbit Hamilton, Beil, was awarded a special prize for an exhibit of eighty-five varieties of Chrysanthemums, set up in excellent taste, in bunches dressed with Maidenhair Fern.

Messrs. Laird & Sons exhibited a splendid lot of cut blooms of Japanese incurved and reflexed varieties, and also a very attractive selection of miscellaneous blooms, made up in triangular bouquets, dressed with Fern in a tasteful manner. Messrs. Jas. Dickson & Sons, Inverleith Nurseries, Edinburgh, had a very excellent collection of cut blooms in variety, as had also Mr. Sinclair, North Berwick; and Mr. McFarlane, Kingsburgh, Prestonpans. Mr. Robertson Muir exhibited a very fine wreath in white Chrysanthemums which attracted general admiration.

Messrs. Dicksons & Co. exhibited a few special varieties of Apples, such as they can recommend for Scotch growth, including Warner's King, Emperor Alexander (the latter very fine), and others grown in their own grounds. *Communicated.*

THE WEATHER AND FLOWERS IN SCOTLAND.

If what we have read lately in some Northern newspapers of the extreme mildness of the season and the great profusion of flowers in some districts widely apart is an indication of absence of frost, then this season hitherto has been mild. Here in a central county, abundance of flowers from outside may be cut; Roses, which seem to have done extra well everywhere this season, are at present very abundant, enabling us to cut several goodly basketfuls every week, and there is an abundance of flower-buds formed and opening. Old Général Jacqueminot holds his own with many others; on two small plants which have flowered freely all the season we can count from thirty to forty opening flowers. Gloire de Dijon has done better on open borders than ever we saw that kind in the North; but out of more than 100 varieties, mostly hybrid perpetuals, there are none which are entirely without opening flowers. Wallflowers (sown last April), Stocks (sown fourteen months ago), Mignonette, and choice Polyanthus, are the sweet-scented kinds which are very serviceable at present. Bedding plants such as Pelargoniums, Calceolarias, Lobelias, are still uninjured. We notice some single Dahlias struggling against the rains (some what copious) to open their flowers, Ampelopsis Veitchii is still in fine condition on buildings and has been as fine in the North this season as ever we saw it in the most favoured parts of the South. *Caledonian.*

TREES AND SHRUBS.

THE GOLDEN LARCH.

Some time since we published a page illustration of the cones and catkins (till then unknown) of the very beautiful and singularly interesting Golden Larch, *Pseudotsuga taxifolia*, and gave a summary of its history (see vol. xxi., May 3, 1884, p. 534). Thanks to the courtesy of Messrs. Rovelli, of Pallanza, we were enabled to complete the history of the tree, and vindicate its claims to be included in a separate genus. Messrs. Rovelli have now sent us a photograph of their parent tree, which was planted about thirty years ago. In autumn the leaves, which closely resemble those of the Larch, assume a brilliant golden colour.

The tree itself is about 15 metres in height (49 feet), the diameter of the head being 11 metres, and the girth of the stem 1 m. 30. This is much the largest tree of the kind that we know of, though there is, or was, a large specimen in the nursery of the Compagnie Continentale at Ghent. We mention this to show

that the tree will withstand a North European climate, and is not restricted to the favoured climate of the Lago Maggiore. Messrs. Rovelli have succeeded in obtaining a large quantity of well-ripened seed, which they offer at moderate rates.

SEEDING OF VERONICA TRAVERSII.

It may interest some of your readers to know that a large plant of *Veronica Traversii* in this neighbourhood has this season ripened seed, self-sown seedlings being now to be seen growing up around the base of the parent plant. The garden in which this *Veronica* is growing is situated on high ground about three miles inland. The plant occupies no sunny, sheltered nook, where the effects of cold winds are tempered, but stands fully exposed to the severity of the biting north wind that blows across the Tay from the snow-clad hills of Angus, and also to the furious north-easters that sweep in from the North Sea. It stood without any protection* but that afforded by the snow throughout the severe frosts of last winter, when the thermometer ranged as low as 10° Fahr.; and this summer it did not seem any the worse, being quite healthy and vigorous, and profusely covered with its pretty white flowers. It is a plant which I am sure only requires to be better known to ensure it being largely used as a hardy ornamental shrub. *J. Wilson, jun., Florist, &c., St. Andrews, N.B.*

COLONIAL NOTES.

PEA WILLIAM HURST IN NEW ZEALAND.

In August, 1884, I imported from London 1 quart of this Pea, which cost me 8s., and I have no hesitation in saying that it was the best investment I ever made in Peas, even including Stratagem. The way it races McLean's Little Gem is a treat to see, besides lasting longer than the last named or American Wonder. Another superior property it has is, the pods contain seven, eight, and nine Peas; and it is a heavy cropper. I could have gathered green Peas from it eight weeks from the time of sowing; but, of course, my object was stock. It is also said here by some (but of this I have not yet sufficient evidence) that even the birds refuse to touch it; if this turns out correct it is indeed a wonderful variety, for so voracious are they here that they positively devour and pull up young plants of Mangel Wurzel and Turnips, which I never knew them to do in England. Numbers are destroyed every year, a rate being levied for the purpose of obtaining poisoned grain, and so much per dozen is given for eggs. Still they seem to multiply with amazing rapidity. I am now writing about the imported small European birds, which by the bye, I sometimes think must have degenerated like some of the bipeds after they have crossed the equator southwards into things other than their original; although it must be conceded they (the latter) left behind them some of the same species as faulty commercially as themselves. But to return to the text. It would be interesting to hear the experience of others who have grown this Pea. This earlier property ought not to be attributed to our climate being superior for Pea growing, for although we are about 10° nearer the sun than you in England—our position here being 42° S. lat.—yet the difference between our day and night temperature—sometimes as much as 20° and 30° even in summer—seriously checks the growth of plants. From this cause we sometimes experience great difficulty with the ripening of sub-tropical fruits in the open air; even Tomatoes grumble about it occasionally, although they do not object to our hot winds, which sometimes push the glass (thermometer) up to 140° Fahr., and one day last summer up to 160° in the sun. All things considered this must be a very early variety of Pea. *T. Smith, Timaru, N.Z.*

STATE OF THE APPLE CROP IN CANADA.

Mr. G. Gibb, of Abbotstford, Province of Quebec, sends us the following note on this subject:—"You asked me when in London in August last to let you know the state of the Apple crop in this part of Canada. Of Apples Duchesse Alexander and Russets have borne good crops of fine quality. Fameuse, St. Lawrence, and Apples of that type spoiled, and the widest failure throughout the different parts of the province that we have had for many years. Our spring was unusually early, yet fruits like St. Lawrence

Apple or Flemish Beauty Pear, which usually ripen the first week in September, ripened September 25 to 30. Hence Grapes (outdoor), though they were good and eatable in some places, were a total failure in others."

Variorum.

JOHN GOULD.—We extract the following particulars relating to this celebrated ornithologist, and who began life as a gardener, from the second volume of Mr. Roach Smith's *Retrospections*:—"Mr. John Gould, one of the celebrated naturalists of the age now passing, when first I knew him, was a journeyman gardener, working for 12s. a week; and when I and a friend went to Windsor to see a bed of Tulips in bloom, young Gould accompanied us to see them, and did not disdain to take the half-crown offered him. A dozen years after, meeting him at a Tulip sale at Hampton Court, he referred to it. The circumstance that set him up in the world was this: the ostrich at Windsor died, and the young gardeners stuffed it, and placed it in the greenhouse to dry. George the Fourth, walking through, drew attention to it, thinking it to be living; but being told it was a dead bird stuffed by the gardeners, asked to see one of them. Young Gould was presented to the King, and after answering some questions, was sharp enough to say, 'May I put on my card Naturalist to your Majesty?' The request was granted; and this was the circumstance that started him. Half a century after, he left behind him when he died, between £70,000 and £80,000."

REMARKABLE COFFINS.—A touching circumstance in connection with the recent funeral of Sir John Harpur-Crewe, Bart., is told by one of his tenants. The shell which enclosed his body was made from a Cedar tree which had been blown down in the park of Calke Abbey, and the noble Oak coffin from an aged Oak tree which, like its owner, had also fallen before the winter's blast. This pathetic incident reminds us of the late Mr. Lucombe, founder of the Exeter Nursery, who, in rearing seedling Oaks of *Quercus cerris* in 1762, found one plant which kept its leaves on during the winter. From this plant he propagated thousands by grafting, and sold them all over the kingdom as *Quercus cerris* Lucombeana. When the original tree in 1782 had attained a circumference of 3 feet, Mr. Lucombe, being then far advanced in years, had it cut down for the purpose of having his coffin made out of it. He, however, lived so much longer than he anticipated, that several years before his death he had another much larger and older tree cut down and sawn into planks, and carefully deposited under his bed, in readiness for the above purpose, and inside those planks, over which for many years he had reposed, he was at last put to rest, at the advanced age of 102 years. *The Timber Journal*, October 9.

Obituary.

MR. EDWARD POHLMANN, the well known Auricula grower and cultivator, of Halifax, died at his residence, Parkinson Lane, in that town, on November 27, at the age of sixty-one years. It will be remembered that he acted as one of the judges at the National Auricula (Southern Section) Show at South Kensington in April last.

Mr. Pohlmann was born at Halifax in the year 1825, where he received his education, and afterwards learned his father's business of a piano manufacturer.

On his father's retirement the business was transferred to his two sons, William Henry and Edward Pohlmann, and was carried on by them for some years under the title of Pohlmann & Son. From his early years Mr. Edward Pohlmann was attached to flowers, and sought relaxation from business in tending them. Eventually the two brothers dissolved partnership, and the younger, Edward, took up the cultivation of plants as a means of livelihood, the Auricula being his pet flower, and at the date of his death he had cultivated it for forty years. He raised and sent out Garibaldi, a black self; another dark self of his raising was Helen Lancaster. This he sold to Mr. Roys, florist, of Rochdale, who sent it out. Mr. Pohlmann had a large collection of the finest named varieties, and he has left behind him some thousands of seedlings, some of which are very valuable, and will, it is expected, take high rank at

future exhibitions. He has also left a fine collection of seedlings of alpine varieties, of which he had a very high opinion.

Carnations, Picotees, Polyanthuses, and Primroses of the best variety were also grown in his garden at Parkinson House, in addition to many other choice plants. So attached was he to his garden that he was to be found in it in all weathers, and it was there he took a severe cold, which terminated in his death. Among florists he was known as an amiable, high-minded, and honourable man, and his presence at Auricula, Tulip and Carnation and Picotee exhibitions will be greatly missed. His son Edward succeeds to the business.

—We regret to announce the death, on the 4th inst., at 42, Ovington Square, of ARTHUR GROVE, F.R.S., F.L.S., late of H.M.'s Indian Civil Service, aged 72. Mr. Grove was a member of the Council of the Royal Horticultural Society, and Vice-President of the Scientific Committee.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DECEMBER 8, 1886.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR (Highest, Lowest, Range, Mean for Day, Mean for Week, Departure of Mean from Average of 35 Years), Hygrometrical Deductions from Glaisher's Tables 4th Edition (Dew Point, Relative Humidity, Sat. in 100), WIND (Average Force, Direction), RAINFALL.

Dec. 2.—Fine, but dull; slight snow fell at 11.30.—the first snow this season.
3.—Fine, and occasionally bright; sky overcast generally.
4.—Wet and dull morning, fine but overcast in afternoon, fine night.
5.—Fine and bright in morning, dull and overcast in afternoon.
6.—Slight showers in morning, dull and overcast generally.
7.—Fine and bright in early morning, occasional showers about noon, fine afternoon.
8.—Gale of wind; barometer at 9.30 A.M.; barometer reading decreased rapidly to 28.13 by 9 P.M., and continued almost steady at this reading throughout the night.

LONDON: Atmospheric Pressure.—During the week ending December 4, the reading of the barometer at the level of the sea decreased from 30.49 inches at the beginning of the week, to 29.6 inches by 1 P.M. on the 30th of November, increased to 30.13 inches by the afternoon of the 3d of December, decreased to 29.74 inches by 1 P.M. on the 4th, and was 29.87 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.93 inches, being 0.63 inch lower than last week, and 0.02 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 49°.8 on the 29th of November; the highest on December 3d was 31°. The mean of the seven high day temperatures was 41°.7.

The lowest in the week was 22° on December 3; the lowest on November 29, was 41°. The mean of the seven low night temperatures was 31°.4.

The greatest range of temperature in one day was 14°, on December 1; the smallest was 6°.8 on November 28. The mean of the seven daily ranges was 10°.3.

The mean daily temperatures were 43°.1 on Nov. 28, 46°.1 on Nov. 29, 38°.6 on Nov. 30, 35°.6 on Dec. 1, 31°.9 on Dec. 2, 28°.8 on Dec. 3, and 36°.9

on Dec. 4. These were all below their averages with the exception of Nov. 28 and 29, which were 1°.5, and 4°.4 above, by 3°.1, 6°.1, 9°.9, 13°.8, and 4°.9 respectively.

The mean temperature of the week was 37°.2, being 2°.6 lower than last week, and 4°.6 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 73° on Nov. 29. The mean of the seven readings was 58°.6.

Rain.—Rain-fall on two days, to the amount of 0.30 inch.

ENGLAND: Temperature.—During the week ending December 4 the highest temperatures were 54° at Truro, 53° at Plymouth, and 51° at Brighton; the highest at Newcastle was 46°, at Preston 47°, and at Bradford 47°.7. The general mean was 49°.5.

The lowest in the week were at Nottingham and Hull 21°, and at Blackheath and Wolverhampton 28°; the lowest at Liverpool was 31°, at Plymouth 28°, and at Preston 27°. The general mean was 24°.6.

The greatest ranges of temperature were at Nottingham 29°, at Truro and Hull 28°; the least ranges were 18°.6 at Liverpool, and 20° at Preston and Newcastle. The general mean was 24°.9.

The mean of the seven high day temperatures was highest at Truro, 50°.4, at Plymouth 48°.3, and at Bristol 45°.1; and lowest at Newcastle, 39°.8, at Wolverhampton 41°.3, and at Hull 41°.6. The general mean was 43°.7.

The mean of the seven low night temperatures was lowest at Wolverhampton and Hull, 30°.6, and at Blackheath 31°.4; the lowest at Truro was 38°.4, at Liverpool 36°.9, and at Plymouth 36°.4. The general mean was 33°.7.

The mean of the seven daily ranges was greatest at Truro and Bristol, 12°, and at Plymouth 11°.9; and least at Preston 6°.4, at Liverpool 7°.5, and at Newcastle 7°.8. The general mean was 10°.

The mean temperature was highest at Truro, 44°.2, at Plymouth 42°.2, and at Liverpool 40°.5; and lowest at Newcastle, 35°.7, at Wolverhampton 35°.8, and at Hull 35°.9. The general mean was 38°.6.

Rain.—The largest falls were 0.96 inch at Truro, 0.77 inch at Preston, and 0.66 inch at Liverpool; the smallest falls were 0.19 inch at Hull, 0.21 inch at Bristol, and 0.22 inch at Newcastle. The general mean fall was 0.46 inch.

SCOTLAND: Temperature.—During the week ending December 4, the highest temperature was 58°.8 at Paisley; the highest at Aberdeen was 47°.8. The general mean was 50°.3.

The lowest temperature was 17°.6, at Aberdeen; the lowest at Greenock was 28°. The general mean was 22°.9.

The mean temperature was highest at Paisley, 39°.8; and lowest at Aberdeen, 34°.7. The general mean was 37°.7.

Rain.—The largest fall was 1.71 inch, at Greenock; the smallest fall was 0.20 inch, at Dundee. The general mean fall was 0.62 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, December 6, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W. :—The weather has been cloudy or dull generally, with frequent falls of rain, sleet, or snow. In many parts of Scotland the rainfall was rather heavy.

Temperature has been about equal to the mean in 'Ireland, S.," but in all other districts it has been below, the deficit varying from 1° to 2° over the more western parts of the kingdom, and from 3° to 4° in the south-east and north. The highest of the maxima, which were generally recorded either on the 5th or 6th, varied between 48° in 'Scotland, N.," and 56° in the 'Midland counties," 'England, S.," and 'Ireland, S.," The lowest of the minima were registered in most places on the 3d, when the thermometer fell to between 15° and 18° over eastern, southern, central, and north-western England, to 17° in 'Scotland, E.," and to between 21° and 26° in most other parts of the kingdom. In the 'Channel Islands' the lowest reading was 34°.

The rainfall has been rather less than the mean in 'England, N.E.," the 'Midland Counties," and

"Ireland, S.," but elsewhere it has generally exceeded the normal value; in "Scotland, N.," and "Ireland, N.," the excess has been considerable.

Bright sunshine shows a slight increase in most districts, the percentages of the possible amount of duration ranging from 16 in "Ireland, N.," and 17 in "Scotland, N.," to 36 in "England, S.," and 47 in "England, N.E."

Depressions observed.—During this period pressure has been comparatively high in the south-western and southern parts of our area, while some large depressions have appeared over Scandinavia, and some small subsidiary disturbances over the more northern parts of our islands. Fresh or strong north-westerly winds were general over the United Kingdom during the earlier part of the period, and on our western and northern coasts they occasionally blew with the force of a gale. Towards the end of the week, however, south-westerly and westerly breezes became prevalent, and were generally moderate in force.

Answers to Correspondents.

TO THE TRADE.—Members of the Trade will oblige by sending notes of matters of Trade interest, Cultural or Commercial. Short notes of daily experience are what are most useful.

ARTICHOKEs: G. S. These, at the price named, will do the Globe Artichokes, which are quoted in the autumn and winter at even higher figures.

BOOK ON TABLE DECORATION: R. Park. The best book on this and kindred subjects is Domestic Horticulture, by F. W. Burbidge. (W. Blackwood & Sons, Edinburgh and London.)

BOOKS: O. M. Gendrevge. You may obtain the Catalogue of the National Chrysanthemum Society from E. W. Allen, 4, Ave Marie Lane, London, E.C.; or W. Holmes, Hampton Park Nurseries, Hackney.—W. R. We know of no book on aquatic plants.

CALVARY CLOVER: Quilten. It is interesting to find this plant should succeed in the open air at Cheltenham. The ball does not usually untwist so much as you describe.

CHRYSANTHEMUM SPORT: C. C. Both the blooms set are poor specimens, and it is impossible for us to form any opinion upon the sport.

CLIMBERS: A. B. To cover the trunk of the tree, you may plant strong growing ivy, as Regner's or the Irish; Ampelopsis tricarpoides (Vitchi); Aristolochia Sipho, Honeysuckles of sorts, Jasminum revolutum, Clematis, climbing Roses, and Begonia radicans: all of these are of strong growth, but must have special preparations made for the roots.

CORRECTION: LIVERPOOL SHOW: At p. 727, instead of Mr. H. Tait, jun., gr. to J. Edwards, Esq., the names should have been reversed.

GRUBS ON PRIMULAS: J. T. Your plants are attacked by some weevil, the grubs of which you sent. Your only remedy is to start with fresh plants, soil, &c.

IMPORTERS OF FOREIGN FLOWERS: E. L. TRY Messrs. Hooper & Co., or Mr. Buck, Centre Row, Covent Garden, London.

MEDLARS AND RASPBERRIES: J. W. A. M. C. M. D. The unseasonable appearance of these is due to the warmth of the late summer and early autumn months. The effect of this in the Medlar has been to cause the bud which should have been developed next spring to expand prematurely, while the Raspberry, which produces flowers from the young wood, was enabled to continue its growth without the usual check.

MR. EDWARD SPARY.—We have to acknowledge the receipt of a Post-office order for 2s. 6d. from C. O., and from K. W. & Co. 5s.

NAMES OF FRUITS: J. C. 1, Winter Nolis; 2, Napoleon.

NAMES OF PLANTS: J. N. Eupatorium Weinmannianum.—D. D. Eonium euporium.—S. D. Goldfussia isophylla.—S. 1, Ophiopogon japonicus, var. Vallichianus; 2, we do not recognise; 3, Fuchsia microphylla; 4, F. fulgens.

* All communications intended for publication should be addressed to the "Editor." Such communications should be written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

INTELLIGENT READERS, DO PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and not to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

Markets.

COVENT GARDEN, December 9

The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal vegetable dealers, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. (E.)

STILL further consignments of Nova Scotia and Canada Apples to hand, 15,000 barrels reaching this market during the past week, and making fair values at slightly lower rates. Grapes slow trade at last week's quotations. A fresh cargo of St. Michael Pines to hand. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit name and price. Includes Apples (15sive, Nova Scotia), Lemons, Pears, Pine-apples, and Grapes.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable name and price. Includes Artichokes, Beans, Kidney, Beet, Brussels Sprouts, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Leeks, Lettuce, Mushrooms, Mustard and Cress, Onions, Parsley, Potatoes, Radishes, Shallots, Spinach, Tomatoes, Turnips.

POTATOES.—Kent Regents, 8s. to 100s.; Schoolmasters, 70s. Beauty of Helron, 100s.; Magnums, 60s. to 80s. per ton.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant name and price. Includes Aralia Sieboldi, Arum Lilies, Begonias, Bouvardias, Chrysanths, Cypripediums, Dracena terminalis, Fuchsias, Epiphium, Erica gracilis, Hyacinths, Regemans, various, Euonymus.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower name and price. Includes Arum Lilies, Azaelas, Bouvardias, Carnations, Chrysanths, Heliotropes, Jasmines, Lagerbergia, Mignonettes, Pelargoniums, trusses, Primulas, Pyrethrums, Roses, Stephanotis, Tropaeolums, Tulips, Violets, Marguerites.

SEEDS.

LONDON: Dec. 8.—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, E.C., describe today's market as being quiet but firm. Red Clover seed especially, although inactive, keeps exceedingly steady; higher prices are asked on the Continent. Choice Trefoil is remarkably scarce, and advanced rates are in consequence demanded. In perennial and Italian Kye-grasses there has been a better trade at hardening quotations. There is no change to note in the value of

bird seeds, Canary being dear, and other varieties very cheap. Feeding Linseed tends in favour of sellers. Mustard and Rape seed sell on former terms. Blue Peas and Haricot Beans are unaltered on the week.

CORN.

MARK LANE: Dec. 6.—English Wheat, the supply of which was small, ruled fully 6d. higher on the week for white, and in some cases 1s. higher for red, but there was not much done. Foreign Wheats were also in demand than on Friday; holders, however, were firm, and the previous advance was generally sustained, except for Indian, which sold 3d. under the highest point. For flour the market was firm at a rise of 6d. to 1s. per sack, and the top nominal price of town flour advanced 3s., making 37s. per sack, the present quotation. Barley of all kinds was dull. Beans met a steady sale at an improvement of 6d. per quarter, and Peas scarcely brought firm prices. Maize was quoted 6d. dearer for rounds, and 10d. for American flat corn, which is quoted 23s. per quarter. Oats were 3d. higher, with a small business doing.

Dec. 8.—The trade all round has been quiet, but without much change in prices. English Wheat was firmly held, and for retail quantities Monday's rates were paid. Foreign Wheats met only a limited inquiry. The flour trade was slow. Maize was firm. Barley and Oats were quiet and unchanged. Beans and Peas tended against buyers.

Average prices of corn for the week ending Dec. 4:—Wheat, 32s. 7d.; Barley, 27s. 2d.; Oats, 17s. 1d. For the corresponding period last year:—Wheat, 31s.; Barley, 30s. 1d.; Oats, 18s. 10d.

FRUIT AND VEGETABLES.

COLUMBIA (East London): Dec. 8.—The demand for vegetables was fair, but low rates offered. Quotations:—Cabbages, 2s. to 2s. 6d. per tally; Savoys, 1s. 6d. to 3s. 6d.; Cauliflowers, 1s. to 2s. per dozen; Spinach, 1s. 6d. to 2s. per sieve; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; Greens, 1s. to 1. 3d. per dozen bunches; Turnips, 1s. 6d. to 2s. do.; Carrots, 1s. 6d. to 2s. do.; Beetroot, 1s. to 2s. 6d. do.; Onions, 3s. 6d. to 4s. per cwt.; Carrots, 20s. to 28s. per ton; Mangels, 16s. to 18s. do.; Apples, 3s. 6d. to 7s. 6d. bushel; Pears, 4s. to 10s. do.

STRAFORD: Dec. 7.—Supplies and trade have been good at the following quotations:—Savoys, 4s. to 5s. per tally; Greens, 1s. per dozen bunches; Turnips, 2s. do.; 2s. to 3s. per ton; Carrots (household), 26s. to 35s. do.; do. (cattle feeding), 20s. to 22s. 6d. do.; Parsnips, 1s. per score; Mangels, 13s. 6d. to 17s. 6d. per ton; Swedes, 15s. to 22s. do.; Onions, 80s. per ton; Watercress, 6d. per dozen; Celery, 10s. to 1s. 2d. per roll; Apples, 3s. 6d. to 4s. per bushel.

POTATOS.

BOROUGH AND SPITALFIELDS: Dec. 7.—Moderate supplies of good qualities came to hand, for which steady rates were paid. Inferior sorts net little or no demand. Quotations:—Regents, 70s. to 105s.; Magnum Bonons, 50s. to 95s.; Victorias, 60s. to 90s.; Chappions, 60s. to 80s. s. per ton.

COLUMBIA (East London): Dec. 8.—The trade still very dull. Quotations:—York and Lincoln Magnums, 60s. to 70s.; Regents, 70s. to 80s.; Essex Magnums, 55s. to 70s.; Cambridgeshire Regents, 65s. to 70s.; Magnum Bonons, 55s. to 65s. per ton.

STRAFORD: Dec. 7.—Quotations:—Magnums, 65s. to 75s.; Regents, 70s. to 80s.; Scotch do. 70s. to 80s. per ton.

Imports.—The imports into London last week consisted of 3798 bags from Hamburg, 3657 Ghent, 4 Rotterdam, 8 Ostend, and 2 cases Bremen.

HAY.

WHITECHAPEL: Dec. 7.—For moderate supplies there was a slack trade, at the following prices:—Clover, prime, 88s. to 120s.; inferior, 70s. to 84s.; hay, prime, 70s. to 90s.; inferior, 30s. to 65s.; and straw, 28s. to 40s. per load.

Dec. 9.—The w is rather short supply on sale. The trade was very dull at previous prices.

CUMBERLAND (REGENT'S PARK): Dec. 7.—There was a large supply of meadow hay, with a fair trade, but slow for Clover. Prices:—Clover, best, 84s. to 100s.; second, 70s. to 80s.; hay, best, 75s. to 85s.; second, 50s. to 70s.; and straw, 28s. to 38s. per load.

STRAFORD: Dec. 7.—Quotations:—Hay, 70s. to 80s.; Clover, 70s. to 90s.; and straw, 28s. to 32s. per load.

Government Stock.—Consols closed on Monday at 100 1/2 to 101 for delivery, and 101 1/2 to 101 1/2 for the account. Tuesday's figures were 100 1/2 to 100 1/2 for delivery, and 100 1/2 to 101 for the account. The figures of Wednesday were as on the previous day for the account, and 100 1/2 to 100 1/2 for delivery. Thursday's final record was 100 1/2 to 100 1/2 for delivery, and 100 1/2 to 101 for the account. These quotations are ex div.

SPECIAL NOTICE.

THE
GARDENERS' CHRONICLE

FOR

SATURDAY, DECEMBER 25,

WILL CONTAIN A BEAUTIFULLY

COLOURED ALMANAC

(18 inches by 13 inches),

FROM AN ORIGINAL DESIGN.

BACCO CLOTH, RUSSIA MATS, &c. Write for
Price List.—H. G. SMYTH, F.R.H.S., 21, Goldenhill's
Street, Drury Lane (lately called 17A, Goad Yard), W.C.

KELP — KELP — KELP.
This powerful and stimulating Ash, made from the sun-dried
plants of Lammaria digitata and other selected seaweeds,
is especially rich in Potash, and Phosphoric Acid. Mixed with
three times its weight of water, it exerts an effect on the
Tubercular System, and on the Urinary System. It is
valuable for the cure of Rheumatism, Gout, and Gravel.
Tomato Plants, and nearly all Floriculture, is marked and
beneficial, while no better dressing exists for Potatoes, Peas,
Scaevola, and Celery. It is an excellent Renovator for Old
Gardens, Soil, and Fruit-trees, and for the Lawns. Price
(retail cash with order only) 8s. per bushel-bag, 6s. included.
Carriage paid on orders of 25 bushels and over.

E. FERKINS & CO., Nurseries, St. Martins, Jersey.
N.B.—As the Seaweed selected for this Ash can only be
harvested during the spring tides of the four summer months,
and then at some distance from the mainland, the supply is
necessarily limited, and Orders will therefore be executed in
strict rotation.

BEESSON'S MANURE is the best for all
Horticultural Purposes. Sold in tins, 12s., 2s. 6d., 5s. 6d.,
and 10s. 6d.; or 1 cwt. bags, sealed, 13s. 6d. By all Nursery-
men or Seedsmen of Great Britain and Ireland. Bone Mills,
Sheffield. Also pure CRUSHED UNBOILED BONES, any
size, and guaranteed of the best quality.

THOMSON'S IMPROVED VINE and

Conservatories, and Concrete Slabs for Walls, Paths, and Stages,
sent post-free on application.

PORTABLE PLANT FRAME.
The above are without exception the most useful kind
of Frame for Plant Growing, and every one with a garden should
possess one. The sashes turn right over one on the other, and
the boxes are put together with wedges and can be taken apart
in a few minutes. Sizes and prices, carriage paid to any station
in England, readily given and painted:—
0 feet long, 4 feet wide, packing cases free £4 10 0

The glass is nailed and putted in.

B. HALLIDAY & CO.,
Hertford Builders and Engineers,
ROYAL HORTICULTURAL WORKS, MIDDLETON,
MANCHESTER.

THE LOUGHBOROUGH GREENHOUSE
HOT-WATER APPARATUS.

This is the simplest,
cheapest, and most
powerful apparatus
made. It requires no
brick setting, no stove-
pipe, no tiles, and can be
taken apart in a few
minutes. It is fitted for
fixing. The
Boiler stands in the
Greenhouse, the front only being outside,
so that the whole of the heat from the Boiler
itself is utilised. It burns over twelve
hours without attention, at a nominal cost.
Price, as engraving, with Boiler, open
feed syphon, 12 feet of 4 inch hot-water pipe, and patent joints
complete, £4 4s. Delivered free to any station. Discount for
cash. Cost of apparatus complete for Greenhouses as below.
Faces delivered free with pipes cut and fitted ready for fixing:—
10 x 6 feet .. £4 10 0 20 x 10 feet .. £5 0 0
12 x 6 feet .. 5 4 " 25 x 12 feet .. 6 16 8
15 x 6 feet .. 6 10 " 30 x 12 feet .. 7 16 8
Proportional prices for other sizes. Estimates free.
Illustrated LIST, with full particulars of these and every
description of Fuel, Gas, and Oil Heating Stoves free.

PUBLISHING OFFICE AND OFFICE FOR ADVERTISEMENTS, 41, Wellington Street, Strand, London, W.C.

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Mans factory, or 1s. 8d. per gallon carriage paid to any Station.

UNSOLICITED TESTIMONIAL.

From ALBERT LOWN, Esq., The Ryels, Atherley Lodge.

"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—Hills & Smiths would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH,

Brierly Hill Ironworks, near Dudley;

118, Queen Victoria Street, London, E.C.; and

136, Stephen's Green, Dublin.

To the Seed Trade. WANTED, as APPRENTICE, a smart, strong, well-educated Youth.—Address, No. 832, KEITH and CO., Advertising Agents, Edinburgh.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish Repeated.

SCOTCH GARDENERS.—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his List a very good SOLENT GARDENER waiting engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

Gardeners. THOMAS KENNEDY and CO. have on their Register a number of first-class GARDENERS, FORESTERS, &c., wishing engagement, and will be glad to furnish particulars to any one in want of same.—(THOMAS KENNEDY, 10, Waterloo Street, Dumfries, N.B.)

Gardeners Under Gardeners, Bailiffs, &c. W. M. CUTHBURN and SON have at the present time on their List Men whose characters will bear strict investigation, and such as from their personal knowledge can recommend as to Landlords, and Gentlemen requiring either of the above can be suited with reliable, first-class men by applying to Wm. Cuthburn & Son, Highgate Nurseries, London, N.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners, and seeking situations, and will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Man, competent either as SOLENT GARDENER, or BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for different situations will be made.—Holloway, N.

MANAGER.—Mr. W. CALE can recommend a thoroughly experienced man to take sole Management in a Large Establishment, to Grow Fruit, Tomato, Hard and Soft-wooded Plants, and Cut Flowers, &c., extensively for Market.—20, Colindale Street, Tottenham, N.

GARDENER (HEAD).—Age 32.—Mr. R. LEACH, Head Gardener, Albany Park, Guildford, can highly recommend a thorough first-class Gardener.—Address as above.

GARDENER (HEAD).—Age 38, married, no family; thoroughly experienced in all branches. Highly recommended.—GEORGE MORRIS, Chapel Square, Kimbolton, St. Neots.

GARDENER (HEAD), where more are kept.—A GENTLEMAN who has recommended a thorough good Gardener. Eighteen years' personal character.—A. B., 62, Coleman Street, Bank, E.C.

GARDENER (HEAD), where several men are kept.—Twenty one years' experience in good places. Well up in Early and Late Forcing of Fruits and Flowers. Good references from present employer.—J. NICHOLAS, The Knoll Gardens, Barton-under-Needwood.

GARDENER (HEAD WORKING), where three or more are kept.—Age 31, married; twenty two years' good practical experience in all branches. Can be well recommended.—JAS. SIMPSON, a, Redcliffe Villas, Maple Road, Suburban, Surrey.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 43, two children (youngest age 9); leaving through family; long to town to live. Twenty years' character. Total abstainer.—Mrs. TYLOR, Shepley House, Carlhalton.

GARDENER.—Sir HUMPHREY DE TRAFALDORF would be glad to recommend his Gardener, and can give him a nine years' character. Leaving through no fault.—Sir HUMPHREY DE TRAFALDORF, 11, St. James Park, Piccadilly, Manchester.

GARDENER.—A GENTLEMAN wishes to recommend as a thorough Working Gardener, Stephen Elkington, age 42, married, three children. Served with Sir Henry Dryden, Bart., and many years with the late Philip, Boy, Esq., of Kadeville, near Buckingham, a noted lover of Flowers. Wages asked, 25s. per week with a house, or 10s. per week without.—STEPHEN UDDKILL, Esq., M.P., Addington Manor, Winslow, Bucks.

GARDENER (good SINGLE-HANDED or where help is given).—Age 25, married, no family; total abstainer; twelve years' experience in all branches. Can be well recommended.—GARDENER, Boughton Place, Maidstone.

GARDENER (UNDER), in a good establishment, houses preferred.—Age 22; nine years' experience; can be well recommended for character and ability.—J. JONES, The Grove, Selkirk, Ross, Herefordshire.

GARDENER (UNDER).—Age 22; no objection to Horse or Cow.—HEAD GARDENER, The Old Abbey, Ealing, W., can recommend Joseph Adams, leaving through employer giving up.

GARDENER (UNDER, or would take a small SINGLE-HANDED place), or as COWMAN and assist in Gardening on a Gentleman's Estate.—Married; four and a half years' reference.—A. B., Dennis Road, East Molesey.

FOREMAN, in the Houses.—Age 24; ten years' experience; held last situation as Foreman. Over two years' good reference from a first-class Gardener.—J. LIDDHART, Wethersfield, near Braintree.

FOREMAN, in the Houses in a good establishment.—Age 27; thirteen years' experience in Growing Vines, Peaches, Melons, Cucumbers, Stone and Greenhouse Plants, and Orchids; well recommended.—M. F., Rendcomb Park Garden, Gloucester.

FOREMAN (WORKING), Outdoors.—ALPHA desires re-engagement; well up in Roses, Fruits, Corners, and General Nursery Work. Excellent references. Fifteen years' experience.—C. Fire House, Powick, Worcester.

To Market Growers and Others. FOREMAN PROPAGATOR and GROWER.—Age 46; eleven years' experience in Pear-growth, Bouvardias, Solanums, double Primulas, Fuchsias, Carnations, Ferns, Eucharis, Dracenas, Cucumbers, Peonies, &c.—Good Saleable.—LAMBERT, a, Bailey's Lane, Stamford Hill, London, N.

To Nurserymen. FOREMAN PROPAGATOR.—Age 29; fifteen years' experience, the last six years in leading London nurseries. Thoroughly practical in Stone and Greenhouse Cultivation, Production of Cut Flowers in quantities, &c.—First-class character.—H. B., 24, Edith Grove, Chelsea, London, S.W.

To Nurserymen. FOREMAN PROPAGATOR, in the Cultivation of Stone and other Plants.—W. R., 29, Taunton Road, Lee, Kent.

PROPAGATOR (SECOND).—Age 25; eleven years' experience in Hard and S. Wooded Roses, Clematis, &c.—Three years with present employer.—A. NASH, Royal Nursery, Slough, Bucks.

JOURNEYMAN.—THE GARDENER, Tedworth House, Marlborough, Wilt., can very highly recommend Two Young Men as above, each with five or six years' experience.—Address as above.

JOURNEYMAN, in the Houses, in a good establishment.—Age 23; nine years' experience. Can be well recommended.—H. CROOKS, Holloway, near Cromford, Derby.

JOURNEYMAN (FIRST or SECOND), in the Houses in a good establishment.—Age 21; seven years' practice under glass. First-class testimonials.—F. LANGRIDGE, Whitebone Lodge, Crawley, Sussex.

IMPROVER, or JOURNEYMAN in Houses.—Age 15; used to Ind. or Work generally and assisting Decoration. Good reference.—Apply to G. A., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

KIFFEMAN, in a good Nursery, where all the latest and best Fruit and Grape-trees are raised. Fifteen years' experience in one of the leading nurseries.—V. Z., Swanhill, near Hereford.

TO NURSERYMEN.—A young man wishes re-engagement in a Nursery; age 21, seven years' experience in good Nurseries. Good reference.—JOHN KIRK, The Nurseries, Russel Street, Wobstanton, Storks-on-Trent.

TO GARDENERS and NURSERYMEN.—A GARDENER wishes to recommend a young man in Garden or Nursery. Four years' experience. Honest, sober, and respectable.—GARDNER, 11, Brunswick Place, Percy Cross, Fulham, London, S.W.

MANAGER, or SHOPMAN.—Well up in all branches; used in London Trade. Highest reference. Eight years' experience.—I. P., 11, Montpelier Place, Montpelier Street, Brompton, S.W.

To Seedsmen. MANAGING SHOPMAN or WAREHOUSEMAN.—A GENTLEMAN with four years' experience in Agricultural, Vegetable, Flower Seeds, Flower Roots, Plants, Implements, Manures, &c. Good references.—D. 152, H. Houndsditch, London, E.

SHOPMAN, or CLERK.—Age 23; well experienced in the London and Country Trade. Short references.—M'AC, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—When inclement weather checks it is a considerable extent the action of the skin, an alternative is resorted to, to compose the body by means of other channels. Holloway's Pills can be confidently recommended as the easiest, surest, and safest means of attaining this desirable end, without weakening the most delicate of our constitution. When from frequently recurring chills, or the inability to impure air, the blood becomes foul and the secretions vitiated, these Pills present a ready and efficient means of cleansing the former and correcting the latter. By this salutary proceeding disease is arrested at its outset, its pains and inconveniences averted, and the nervous system freed from the depressing effects entailed upon them by an illness.

Cures of Asthma, Bronchitis, Rheumatism, Coughs and Colds, BY DR. LOCOCK'S PULMONIC WAFERS.—Mr. DAVERLEY, Chemist, 24, Carter Gate, Nottingham, writes:—"Several cases of Asthma, Rheumatism, and Coughs, which had been cured within the lapse of a very short time by the Wafers." They give instant relief, a rapid cure, and taste pleasantly. Price 1s. 1/6d. and 2s. 9d. per Box. Sold by all Druggists.

NEW DESSERT APPLE,

"BEAUTY OF BATH."

GEO. COOLING & SONS

Have pleasure in offering a small Stock of this fine early Dessert Apple.

It ripens in July and early part of August, is quite distinct, of medium size, exceedingly handsome in appearance, being beautifully striped with red towards the sun, has a brisk, sweetly flavoured, and is in every respect far superior to Juneating or Irish Peach; it is a large and certain cropper, and on that account will be most valuable as a market variety.

During the past two seasons it has been awarded 1st Prizes in the Dessert Classes at Faintin, Frowbridge, Weston-super-Mare, Kew, and other West of England Shows, where Apples are always well exhibited.

Strong Maiden Trees, 3s. 6d. each.

Usual Discount to the Trade.

As our Stock is limited we respectfully solicit early orders.

THE NURSERIES, BATH.

ORCHIDS—ORCHIDS.

Most of the Plants being in Pots may be despatched at any time, or by Parcel Post when fit.

RICHARD SMITH & CO.,
NURSERYMEN AND SEED MERCHANTS,
WORCESTER.

J. WEEKS & CO.'S PATENT DUPLEX UPRIGHT TUBULAR BOILER,

With Hollow Furnace Bars, Patent Diaphragm, and Fuel Economiser.

WEEKS BOILERS are beyond all comparison those which offer the **GREATEST VALUE TO PURCHASERS**, and most combined advantages to **Gardeners**. Their merits so far exceed those of any other Boiler that almost every new Boiler brought into the market in some degree imitates them, and this notably with respect to the Hollow Furnace Bars, the use of which has been advocated by **J. WEEKS AND CO.** upwards of 40 years, and who have proved that the Water gains on an average from 20 to 25 degrees of heat in its passage through their Hollow Furnace Bars before entering the Boiler.

Full particulars, and Illustrated Price List of Boilers, also New Book of Designs, 13th edition, post-free on application.

Address—**J. WEEKS & CO.,**

HORTICULTURAL ENGINEERS AND PATENTEES, KING'S ROAD, CHELSEA, S.W.

GREAT CLEARANCE SALE

OF

BARR'S BEAUTIFUL HARDY DAFFODILS.

"Daffodils, that come before the swallow dares, and take the winds of March with beauty." SHAKESPEARE.

BARR'S HARDY DAFFODILS

Are acknowledged to be the fairest among the flowers of Spring, and form a new and popular feature in Spring Gardening. They have been awarded at different times many Medals—Gold, Silver, and Bronze—besides many Prizes and Certificates, by the Royal Horticultural Society, Royal Botanic Society, Crystal Palace Company, &c., at their London Spring Shows, where they have always formed the centre of attraction.

ALL AT GREATLY REDUCED PRICES.

THE FINEST LATE YELLOW CHRYSANTHEMUM

IN CULTIVATION

For Cutting Purposes

IS

"MRS. JONES,"

WHICH WAS AWARDED A

First-class Certificate

BY THE

NATIONAL CHRYSANTHEMUM
SOCIETY,

THIS SEASON.

It is a sport from the well-known Japanese variety "ETHEL," and is the exact counterpart of that favourite variety in every way, excepting the colour, which is a beautiful rich bright golden-yellow, distinct in colour from every variety in cultivation. I shall have no quantity of flowers until CHRISTMAS, the main batch will be at their best from that time until the END OF JANUARY; showing it to be a specially LATE-flowering variety.

Price, per Dozen, Hundred, and
Thousand, upon application.

THOMAS S. WARE,

HALE FARM NURSERIES,

TOTTENHAM, LONDON.

Grape Vines and Strawberries (in pots). FRANCIS R. KINGHORN offers very fine stocks of the above in all leading varieties, true to name. LIST and Prices on application.

(By Special Appointments to H.M. the Queen and H.I. and R.H. the Crown Princess of Germany.)

PAUL & SON'S
Great "Hardy Plant" Nurseries,
THE OLD NURSERIES, CESHUNT.

Station Great Eastern Railway, 13 miles from London.

THE NEW EDITION OF ROSE
and Fruit and Ornamental Tree Catalogues are carefully prepared and worth examining by all Florists.
Post-free on application.

PAUL & SON'S CESHUNT ROSES
have maintained the 80 years' reputation of Paul's Firm.

PAUL & SON'S FRUIT TREES.
Unquestionably the finest standard Apples, Pears, and Plums in the Trade—50,000 for Sale. Large planters should come direct to the producers.

PAUL & SON'S ORNAMENTAL TREES.
Particledured, Avenue, or Shelter Trees in almost unrivalled variety.

PAUL & SON'S SHRUBS & EVERGREENS
Hollies—3 acres of the finest Gold and Silver kinds. All Evergreens so frequently transplanted as to be safe to remove.

PAUL & SON'S AMERICAN PLANTS.
Rhododendrons and Azaleas smothered with bud. Grow in loam at the High Beach Nursery.

PAUL & SON'S HERBACEOUS & ALPINE PLANTS.
An immense variety at the new Broxbourne Nursery, specially devoted to these plants.

PAUL & SON,
THE OLD NURSERIES, CESHUNT,
were the continuous exhibitors at the Chiseldon.

BE CAREFUL IN THE ADDRESS.

Kent—The Garden of England.

300,000 FRUIT TREES—true to name.

GEORGE BUNYARD & CO.,
THE OLD NURSERIES, MAIDSTONE,

(Established 1795), will forward, for Six Stamps, their

DESCRIPTIVE FRUIT CATALOGUE,
with Illustrations and Cultural Notes (copyright edition). See *Gardeners' Chronicle* of Sept 4, p. 213. The first stock ever offered—clean, healthy, with good flowers &c. Frequent Fraos from London by North Kent and London & Chatham Railways.

FRUIT TREES,
SEVENTY-FOUR ACRES.

APPLES, PEARS, PLUMS, CHERRIES, PEACHES, NECTARINES, APRICOTS, and other FRUIT TREES, as Standard, Dwarf, Pyramid, Bushes, Girders, and Trained Trees in great variety.

VINES, excellent Canes, 31, 62 to 105 *6d.* Orchard House Trees in pots, PEACHES, APRICOTS, NECTARINES, &c. from 5⁰. FIGS from 3⁰ *6d.*

DESCRIPTIVE LIST, containing a sketch of the various forms of Trees, with Directions for Cultivation, Soil, Drainage, Manure, Pruning, Lifting, Cropping, Treatment under Glass; also their Synonyms, Quality, Size, Form, Skin, Colour, Flesh, Flavour, Use, Growth, Duration, Season, Price, &c., free by post.

RICHARD SMITH & CO.,
WORCESTER.

DARTMOUTH CRAB.

NOTICE.

HAVING purchased the principal part of Mr. Laxton's Stock of this handsome fruit, we are able to supply the Trade at 15s. per dozen. It is a remarkable sort, in size and colour resembling a large Victoria Plum. Good dessert quality, vigorous grower, and very fertile. Stock very limited. Order early.

HARRISON & SONS,
ROYAL NURSERIES, LEICESTER.

PRIZE COB and other NUT TREES.
Gentlemen desirous of obtaining the true
WEBB'S PRIZE COB FILBERT TREES,

AS ALSO THE

Kentish Cob and other Nut Trees, should send their Orders as early as convenient to Mr. COOPER, F.R.S., Calcut Gardens, Reading, of whom alone the various sorts can be obtained.
PRICE LISTS and PAMPHLETS on application.

SPECIAL NOTICE.

THE

GARDENERS' CHRONICLE

FOR

SATURDAY NEXT,

December 25,

WILL CONTAIN A BEAUTIFULLY

COLOURED ALMANAC

(18 inches by 13 inches),

FROM AN ORIGINAL DESIGN.

OR WITH

ALMANAC MOUNTED ON OAK ROLLERS,

READY TO BE HUNG UP, AND ENCLOSED IN CASE,

Sevepence; Post-free, Eightpence-Halfpenny.

Purchasers are specially recommended to order the Almanac in a Case,

TO PREVENT INJURY FROM FOLDING.

The Publisher cannot be responsible for injury to the Almanac unless it is so protected.

NOTICE TO ADVERTISERS.

As a

LARGE EXTRA SALE

of this Number is guaranteed, it will be a very valuable medium for Advertisements.

APPLICATIONS FOR SPACE

should be sent in

NOT LATER than TUESDAY NEXT, the 21st inst.

W. RICHARDS,

**41, WELLINGTON STREET,
STRAND, W.C.**

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 18, 1886.

PLANT GROUP at THE
EXETER SHOW.

(SEE SUPPLEMENTARY SHEET.)

THE subject of our illustration is a picturesque group of flowering and foliage plants, arranged by Messrs. Robert Veitch & Son, of Exeter, for the exhibition of the Devon and Exeter Horticultural Society in August last. One end of a large oblong marquee was placed at Messrs. Veitch's disposal, and in this space they arranged their plants in a novel and artistic manner. The staging was covered with irregular blocks of virgin cork, which were arranged in a natural and irregular group, here and there a boulder sticking out, there a mossy knoll, while the sides were flanked by Ivy-covered rocks and suboptical vegetation. In the centre of the rockwork was a little pond—silvered glass representing the water—which appeared to run back among the caves formed by the rocks until lost to sight. On the verge of this pond were growing little patches of aquatic plants, Ferns, Reeds, Pitcher-plants, Sarracenias, &c. Projecting from the overhanging rocks were graceful foliage plants, such as *Doryanthes Palmeri*, with *Ampelopsis Clematis*, and Ivy, clinging, as it were, to the sides. Here and there were bright telling patches of double and single *Begonias* of varying hues, from pure white to deep crimson. In the crevices were some very interesting little alpenes—alpine Poppies, Anemones, Edelweiss, and other rock plants. Standing up boldly from the sides were some stately perennials such as *Campanulas* and *Delphinium hybridum* in many shades of blue; while, affording a fine contrast, were several tall trusses of *Lilium auratum* with some of the shorter Lilies like *L. Harrisii* at their feet. Overhanging, and arranged with good effect, were Tree Ferns and many of the hardy British Ferns, backed up with fine specimens of *Eucalyptus globulus*—the foliage of the Gum trees making a fine set-off to the Fern fronds and the gay colours below. A few Orchids were judiciously but sparingly introduced.

In the evening of the show day fairy lamps were dotted about here and there on the margin of the pond and among the rocks, while from boughs and jutting "boulders" were suspended pretty Arabian lamps, which threw a warm, subdued light over the group. There is no doubt but that much could be done in this direction in staging plants at flower shows to relieve their tiresome monotony and to show plants to their best advantage. In this case Messrs. Veitch only commenced the erection of their group the day before the show. It is therefore all the more creditable to them that they should, on the spur of the moment, as it were, have produced an effect so happy and so suggestive. But with the material at their disposal, and their known capabilities in this respect, there is no room for surprise at the result.

New Garden Plants.

CYPRIPEDIUM PRÆSTANS, *Rehb. f., n. 16.**

A MOST unexpected surprise. I have before me a living plant, a fine peduncle bearing five flowers and buds, and a single flower, beautifully preserved in alcohol. It is of Papan origin, and was kindly sent to me by Messrs. Linden. When looking at the contents of the mighty bottle, full of varieties and novelties in company with smaller ones, I thought of *Cypridium glanduliferum*, Blume. It is, however, not that species, as both my herbarium and the *Rumphia* show distinctly that Blume's plant is less vigorous; it has much smaller bracts, quite distinct petals, and last, but not least, a straight stigma. The star-like ornaments on the petals show that it is an associate of the Rev. Mr. Parish's *Cypridium*.

The leaves of the living plant have all the strong texture and the varnish of those of *Cypridium levigatum* and *C. Köhleri*. The peduncle is very strong, covered with short dark hairs. The inflorescence is five-flowered, and appears to have been pendulous. The spatheaceous bracts are nearly equal to the stalked ovary. The flowers surpass all those of the above-named species, and are nearly as large as those of *Cypridium grande*. Both sepals are nearly equal, though, curiously enough, the connate one is rather broader. The three median nerves are keeled outside, petals linear-ligulate, very much undulated at the base, as in fine *Methonea* (*Gloriosa*), tapering at the end, surpassing the lip by one-third. The lip has a very long channelled stalk, and has the uncommonly elegant shape of that of *Cypridium Stonel* itself. The staminate is like that of *Cypridium Köhleri*, exceedingly gibbous at the base, abruptly acuminate at the top, villous on the sides.

The greatest merit of the plant lies in its quite novel stigma, which is broken up, and ascends at right angles like a beak. The stigmatic bodies of *Cypridium levigatum* and *C. Köhleri* are a little ascending at the top, but this one is quite distinct.

I learn from Mons. Lucien Linden that the plant has its *sepal yavne* and the *sepalis striis de brun foncé*, *H. G. Rehb. f.*

OPLISMENUS BURMANNI VAR. ALBIDULUM
(*new var.*).

This is a most charming little grass, new, distinct, and pretty, which has been recently introduced from India by Messrs. Veitch & Sons. It is a variety of the common and widely spread *O. Burmanni*, and differs from the well known variety *variegatum* (or *Panicum variegatum*, as it is often called in gardens) by its dwarf and more compact habit and differently coloured foliage. The stems are rather stouter, more erect, and far less straggling than in the variety *variegatum*, and the leaves are white with a pale green stripe or ill-defined area along the midrib. I am informed that the plant comes true from seed; the white foliage is charming, and being of quick growth and compact habit this pretty little grass is likely to become a useful and desirable decorative plant. *N. E. Brown.*

EDWARD PYNÆERT.

MANY of our readers, frequenters of the Ghent "Quinquennials," and others, will be glad to see the *vera effigies* of M. Pynæert (on opposite page), whose quarter of a century of service as Professor in the State School of Horticulture at Ghent, was celebrated, as recorded by us at the time, with so much spirit a short time since.

* *Cypridium præstans*.—Folius coracis ligulatis apice minuti-simè inæquali-bilibus, inferius sub nervo medio carinatis, ultra pediculus, ultra duos pollices latis, nudissimis; pedunculo pilosulo piloribus, racemoso (quinquedoro); bracteis spatheaceis carinatis (apice tridentatis), ovaria pedicellata leviter subseguantibus, sepalis levigatis, sepalis superioribus oblongo-ligulatis acutis supra nervum medium carinatis, sepalis parvis subaequalibus bicarinatis; tepalibus deflexis linearibus densum angustioribus labellum superantibus, basi energeticè undulatis, basi mar. umbis, basin versus pilosulis; labelli lingue canaliformis elongato, lobato obtuse convexo atropo; staminibus basi valde gibbo lanceo acuminate lateribus pilosis; stigmata triangulari sub angulo recto flexo ascendente. Fl. us. Papan; introd. cl. Linden. *H. G. Rehb. f.*

MARKET-PLANTS.

MIGNONETTE.—The immense quantity of Mignonette grown annually for market purposes proves that it is one of the most popular of flowering plants; although there is a certain demand for it throughout the year, it is during the early spring and summer months that it is most wanted, being then used for purposes of every description.

A few years ago there was scarcely any that sold more readily than Mignonette, but during the last three or four years the supply has been quite equal to the demand, and a considerable improvement has been observed in its culture. In growing Mignonette for market, to secure a profitable return it must be well grown—that is, it must be dwarf, with fresh green foliage down to the pots, with stout, sturdy spikes of bloom. If a regular succession be kept up—say, from early in March to the end of June—a fair average price may be relied upon, though perhaps during the time there may be a glut, when the price may fall very low. I have known really first-class stuff to be sold for 3s. 6d. per dozen pots, and it may have been sold for considerably less than this; but a fair average price is from 5s. to 9s. per dozen, and anything extra good may fetch 12s. per dozen, especially early in the season.

It is to the late Mr. Parsons, of Brighton, that we are indebted for the first great improvement in the varieties of Mignonette. He was also one of the most successful cultivators of his time. It was with my father, who was nursery manager to Mr. Parsons, that I commenced my gardening career, and from that time I have always taken a great interest in this fragrant, though unassuming flower. I well remember the first plant that was selected, from which, after several years' selection "Parson's White," *Reseda odorata eximia*, was obtained; this was a great improvement on any other variety grown at that time. It was exhibited at South Kensington in the spring of 1870, and was awarded a First-class Certificate, it also obtained several other first-class awards the same season. It is now difficult to obtain a new strain of this variety. Its chief characters were the whiteness of the flowers, which was caused by an almost entire absence of stamens (the anthers of which give the colour in other varieties); and an unusual development of the petals, the individual flowers being more than twice the size of those of any ordinary variety, the spikes of bloom of great length, and the plant of vigorous habit.

Miles' Spiral is another good variety; this originated with Mr. Miles, of West Brighton; the stock was obtained from one plant, which came up among a batch of the dwarf red Continental variety, *ameliorata*. I saw the parent plant of this variety, and I may say I have never seen a finer spike of bloom on so dwarf a plant as that produced. In the collection that was grown for trial at Chiswick a few years ago this proved to be one of the best for pot work, being dwarf in habit and producing fine bold spikes of bloom. Although this was received from several firms, there was but little variation, which is more than could be said of some of the varieties. *Vilmorin's* pyramidalis grandiflora, is one of the best for market work; it is dwarf in habit, of vigorous growth, and produces stout, though rather short spikes of bloom. In this variety the stamens are numerous, and the reddish-brown anthers are very conspicuous. *Matchet* is a newer variety, producing immense spikes of bloom; it is one of the best for market work. *Golden Queen*, or *ameliorata aurea*, is another very distinct variety, of dwarf habit; in this variety the anthers are yellow; it is very pretty as a variety, but of no value for market purposes.

Besides the varieties above mentioned, there are many others offered, some of which are distinct. In referring to two catalogues that happen to be at hand, I find in one twelve varieties, all enumerated, while in the other there were eight; and as the same names occur in only four instances it would signify sixteen varieties. I think that some of the names given are misleading, such as *Crimson Giant*, *Pyramidal Bouquet*, *Crimson Queen*, &c. As far as I have seen, these varieties are very little better than the ordinary form, and certainly do not merit the names applied to them.

All the varieties of Mignonette are liable to considerable variation, and it requires great care in sowing the seed to secure a true strain, especially where there are several varieties grown together. Where a batch of any variety is intended for seed, it

should be grown in an isolated position, and as they come into flower they should be gone through and any of inferior quality pulled out, otherwise the stock will soon deteriorate.

CULTURE.

The best position for growing pot-Mignonette is in pits or frames, and as one great point is to keep it as dwarf as possible, the closer to the glass it can be kept the better; it is also necessary that the glass should be kept clean. In preparing a range of pits for Mignonette it is a good plan to have them in three sections, the first to be filled up, so that when the seed-pots are plunged they are within 3 or 4 inches of the glass; by the time the plants require more room they may be transferred to the second section, which should be a little deeper; here they may remain until they require tying, when they should be placed in the third section, which should be deep enough for the plants to remain until they come into flower and are fit for market. A regular succession may be kept up by filling the first section of the pit in two separate sowings, the second to be made about the time the first is beginning to show the second leaves; by following on with successive sowings each section may be kept filled up, and a regular supply obtained.

In preparing the seed-pots they should be well drained, and it is a good plan to mix a little soot with the drainage. The compost for filling the pots may consist of good maiden loam, with a little well-rotted manure added, or, what is often used by market growers, any old potting soil, with a little manure added; provided the soil be fairly rich and not too heavy, anything that is at hand may be used, care should be taken, however, that it is free from worms as possible. In filling the pots the soil should be pressed as firmly as possible, and the seed should be well covered with soil.

For early spring work the seed should be sown in the autumn—say, about the beginning of September—and throughout the winter it should only have sufficient warmth to keep the frost off. The first spring sowing may be made about the middle of February. That sown in the autumn as well as that sown early in the year requires great care to keep it healthy until the days get longer and the weather brighter; the main thing is to avoid it getting drawn and weakly.

THINNING-OUT, WATERING, &c.

As soon as the seedlings are large enough to handle they should be thinned out, leaving from six to nine plants in a pot. Six plants will be quite enough to fill a 48-sized pot, but it is best not to thin too closely at first, in case of a few plants damping off.

Watering is one of the most important matters connected with the culture of Mignonette. Great care must be taken not to get the pots too wet, especially during the earlier stages; as the plants get more advanced and the pots full of roots it is necessary to guard against the other extreme; either excess is very damaging, if not fatal, at any time. As soon as the roots get round the pots, liquid manure may be used, beginning by using it weak, and using it more freely as the plants advance.

Ventilation must always be given freely, and no artificial heat used except to keep out frost. *A. Hemley.*

THE SEED TRADE.

THE PEA CROP.—The Pea crops have not turned out so satisfactorily as the trade were led to suppose they would two months ago. The early deliveries were generally of a decidedly assuring character, but later ones show that the main crop and late varieties have unfortunately in not a few instances suffered very much indeed. Especially does this appear to be the condition of things in the Lincolnshire district, where, although there was at one time the promise of good crops, a very large portion which fell before the seed Peas were in a condition to be harvested. And this is applicable equally to the round as to the wrinkled varieties. The fact that the harvest was later than usual, owing to the retarding character of the spring and early summer, has greatly operated against a successful result.

At present but few seeds excepting Peas and Beans have come to hand, and the deliveries are later than usual from the cause just named. Small seeds such as Cabbages, Broccolis, Kales, &c., promise to be a fair average. Fine open weather is now badly wanted,

so that the seeds in the husks can be threshed out and sent in to the dealers.

THE ONION.

The leading Onion of the day is undoubtedly the White Spanish or Portugal, or what has been known in later years as the Reading. That all the sorts having the Anglo-Spanish character, from Nuneham Park and Banbury Improved, down to the latest novelty, Rousham Park, have been derived from the White Spanish, there can be doubt; and it is very probable that selection has had more to do with the creation of assumed sorts than fertilisation. The origin of the White Spanish Onion, as well as of its conqueror, the Strasburg Brown Spanish, or Deptford, is no

informed by the representative of one house that their sales averaged 30 tons of Onion seed of various varieties, but fully one-fourth of the bulk is the White Spanish. When it is borne in mind that seed of the White Spanish will weigh from 37 to 39 lb. per bushel, some idea may be formed of the vast number of grains that go to a ton weight.

The seed of the White Spanish Onion which passes into the hands of the London trade is mainly grown in Bedfordshire. Passengers by the Great Northern Railway are familiar with the large breadths of Onions to be seen between Hitchin and Huntingdon; and in July and August, when the huge beds of Onions have developed on their stout stems the large ball-like heads of seed-vessels, they form picturesque sight.

ciently bulbed to go to market, and leaving those not sufficiently matured until another day.

It is sometimes said that the Bedfordshire White Spanish Onions have deteriorated in quality, and this is accounted for on the ground that the growers send all their best bulbs to market and retain only the refuse for planting for seed. This is no doubt unfortunately true of many, and an inferior stock is a certain result. Some growers act differently: they select and retain for planting for seed some of their largest and handsomest bulbs, and sow the seed obtained for their main crops.

The Brown Spanish, or Deptford, or Strasburg Onion is regarded as having a stronger flavour and being a better keeper than the White Spanish; and

EDWARD PYNART.

doubt involved in great obscurity. Philip Miller in his *Dictionary* (1731) enumerates seven species, under the head of "Cepa," among them the Strasburg, the Red Spanish (probably answering to our Blood-red), and the White Spanish; and he alludes to these three sorts as "propagated for winter use, their roots being preserved dry during the season." In a thoroughly reliable seed list published in 1817, I find enumerated the White Spanish, Deptford, Globe, James' Keeping, Blood-red, Silver-skinned, Strasburg, White Spanish, and the Cerrunian Onions, whatever the last may have meant; but the White Spanish is our representative one—there is scarcely a garden in which it is not to be found during the summer, and it is the variety depended upon for the main winter supply. That it is capable of improvement by selection and cultivation there can be no doubt.

Very large quantities of seed of Onions pass through the hands of our leading wholesale seedsmen. I am

Much depends upon the weather at the time the seed is ripening, whether the sample is good or indifferent; in wet weather mildew will attack stems and seed-balls alike; and then the seeds are small, light, and the germinating power indifferent. The bulbs are planted out in spring for seeding; and it appears to be the custom of the growers to break their plantations of Onions up into different breadths rather than to have them together in one huge piece.

The pickling Onions that find their way into the London markets in such large quantities are grown in Bedfordshire. The refuse seed from the harvest of White Spanish is sown by some of the growers, and it is from this variety that the "picklers" are obtained. The seed is sown in February and March, and while some growers are content to sow 30 lb. per acre, others will sow 40 lb. and even more. About the end of July, nice little bulbs are formed, and women then go over the beds, pulling up all that have suffi-

it is probably owing to the possession of the latter quality that some gardeners prefer to sow it for their main crop. It is worthy of remark that this is an Onion much grown in Ireland. Seed of this variety comes largely from abroad—a great deal from Holland.

"It is the kind most commonly used for field culture about Paris, and it is grown in very large quantities in the neighbourhood of St. Denis, and as far north as Normandy. The winter supply of Paris and of a great part of Europe consists chiefly of this variety, which may be often seen hanging up in dwelling-houses, in long hanks formed by interlacing and plaiting the withered leaves together." (*Vilmorin's Vegetable Garden*.) Formerly large quantities of seeds of this variety came from the south of France, and probably the supply continues. The White Spanish and Brown Spanish are both flat Onions. As far as the United Kingdom is concerned the Brown Spanish Onion is much more largely used in Ireland and

Scotland than in England, where the White Spanish finds greater favour. The bright brown thick skin of the former enables it to bear rougher usage than the latter, and its stronger flavour appears to be appreciated also.

The Globe Onions are globular rather than flat shaped; the group comprises several varieties, among them the white skinned, the brown skinned, Bedfordshire Champion, Magnum Bonum, Excelsior, and that newer prodigy, the Wroxton Park. They form a very valuable group, and should be grown much more than they are, as the produce a crop of larger weight, and are regarded as being better flavoured. The Globe Onions are related to the Pear-shaped Onions of the French, of which there are numerous varieties, having long bulbs, which differ from one another in colour and earliness. The bulbs of the Globe Onions grown in this country are almost as broad as they are long; the one most in request of the best known types is the Bedfordshire Champion. This is said to be a selection obtained in Bedfordshire and it is found to produce a heavy weight per acre. Not a few gardeners grow the White Globe in preference to any other, and they are justified in doing so, though it is considered not to keep so well as the Brown Globe or James' Long Keeping.

The Blood-red Onion is an old hardy variety, much in use for flavouring dishes in cooking, though by no means largely grown in England, but much more so in Scotland. It is also largely grown in the northern districts of France. It is well named because of its blood-red skin; in some of the bulbs the colour is deepened almost to black. There is a fine variety of this of American origin, known as the Wetherfield, in shape and colour coming near to Danvers' Yellow. It is an Onion that keeps well, but is not particularly hardy in character. Messrs. Vilmorin & Co. inform us that "in the south-west of France, especially about Bordeaux, a very fine variety of Onion is sometimes met with under the plain name of the Red Onion. The flesh is tender and mild-flavoured, but the bulb does not keep well." One is led to imagine from this description that it is closely related to the Blood-red Italian Tripoli. Then there is the Bright Red August Onion, chiefly grown in the south-eastern parts of France, where it is sown in August, and comes into use early in the following summer, as do the Tripoli varieties that are cultivated in this country.

There is now a considerable group of Italian or Tripoli Onions. The Spanish Onion of the shops is the Madeira Globe Tripoli or French Globe Tripoli, which is regarded as a better keeper than the Italian Globe or Giant Rocca. We may say of the Italian Onions that they are all Tripolis, and they are much esteemed for their mild flavour, but they do not seed in this country. I doubt if it is within the knowledge of the oldest and most experienced gardener that he has known the Tripoli Onion to produce seed in England; consequently, seed has to be obtained from Italy, France, and elsewhere. Our climate is too cold for them to perfect their growth by producing seed; and yet it is a hardy Onion, the seed being sown in August in order to get fine grown bulbs at Midsummer, thus preceding our early spring-sown Onions.

Autumn-sown Onions form a feature in schedules of prizes, and it is the Tripoli varieties that are found competing, namely, the Giant Rocca and the large White Flat Tripoli. The Tripoli Onions will come to a good size if sown in this country in spring, and perhaps the Giant Rocca is best suited for this purpose, but the bulbs are never so fine as when the seed is sown in autumn.

It is found by experience that the Tripoli Onions raised from seed sown in spring do not keep so long as those produced from seed sown the previous autumn. Undoubtedly the two best are the Giant Rocca and the Giant White Tripoli. The late Mr. John Sandish used to grow at Ascot very fine Tripoli Onions from spring sown seeds. The Barsano and the Silver skin of Naples are largely grown in Italy; but it is found that Geneva supplies the very best types. In private gardens the silver-skinned Onion is that generally grown for pickling purposes, because it is said to turn in early in the form of small well-ripened bulbs. The Queen Onion is of the silver-skinned type, but decidedly the earliest to turn in that can be had. We have seen it at Chiswick many days ahead of any other of the section. The Early Nocera belongs to this group. The Neapolitan Maggiaiola, or Marjazole, is a small white Italian

variety of rapid growth, but now almost entirely superseded by the White Italian Tripoli.

The Welsh Onion—a native of Siberia or the East—is the *chabote* of the French, a species that does not form bulbs—though this characteristic is asserted in high class kitchen gardening by a high authority like Mr. W. Earley—is now nearly extinct as far as this country is concerned. It would be interesting to know how it came to be termed the Welsh Onion. It produces leaves all the winter through, and the first cuttings may be made three months after sowing the seed. The leaves, which possess a strong oniony flavour, are used for seasoning. The Two-bladed Onion is now almost superseded, most of the plants producing only two blade-leaves—hence its name. It is a curious species, formerly used for pickling purposes.

The tree Egyptian or bulb-bearing Onion is occasionally found in this country, and is grown more as a curiosity than for any useful purpose. Instead of producing seeds at the top of the stem there is found a cluster of small bulbs, by means of which the plant is propagated. The root-bulbs soon decay, but those produced will keep for some time.

The Potato or underground Onion is only sparingly cultivated in England, and probably because the crop is lost sometimes during the winter. "In the South of England, where this species is somewhat of a favourite, the rule as to growing this plant is to plant on the shortest day and take up on the longest." New bulbs are formed round the parent one, and it is thought best not to earth them up but to let them have all the light and air possible. It is said that the larger the bulbs are, the worse they keep.

The harvesting of the crop of Onions, if the bulbs are to keep for any length of time, is as important a matter as the cultivation of them. When moist growing weather, or a wet summer happens, there is of necessity a lack of the fine sunny drying weather that has so much to do with the proper ripening of the crop. It is best to go over the beds and gently break down the short succulent stems, not bruising them if it can be avoided. This arrests the flow of sap, causes the tops to turn yellow, and hastens the ripening process. Then when the necks have become shrunken the crop should be pulled and allowed to dry in the sun; hurdles covered with mats answer well to spread the bulbs upon. When ready for storing, they may be laid out on the floor of a loft, or in any place where it is cool and dry. The old country plan of roping is a good one to follow where there is limited space for storing. A wisp of straw a yard in length will take a good many bulbs, provided the latter have strong stems that can be tied to the straw. These can be hung up anywhere in any dry outhouse, or even in the open air, if they are protected from frost. It is damp that causes premature growth, and this should be avoided if possible.

The Onion is one of the oldest of known vegetables. If it were regarded by the ancient Egyptians as a plant partaking of a sacred character, it must have been also an article of the national food; for did not the children of Israel, as they wended their way towards the Promised Land, look back with regret and longing upon the "Leeks and the Onions and the Garlic," which in Egypt they did freely eat? And yet Juvenal, in one of his satires, ridiculing the veneration entertained for this and other vegetable products, wrote:—

"How Egypt, mad with superstition grown,
Miles gods of monsters, but too well known;
His mortal sin an Onion to devour,
Each clove of Garlic hath a sacred power,
Religious nation sure, and Ilest abuses,
When every garden is o'errun with gods."

The priests of ancient Egypt were forbidden to partake of them, though their Onions were of large size and exquisite flavour; but they were admitted among the offerings placed on the altars of the gods. *Pisum.*

ANNENING A ROADWAY.—At the Surrey Sessions the other day Mr. A. Waller, a Government clerk, was indicted for having inclosed 6 feet of the highway at Caterham Valley for a length of 111 yards. He was found guilty, and Sir W. Hardman ordered him to enter into his own recognizances to come up for judgment next Sessions, when the amount of fine would depend on whether he had set back his fence.

The Apiary.

GENERAL REMARKS.

THOUGH we have had some cold days, on which bees had to stay at home, yet there have been several warm ones, when they could take some cleansing flights, and they were not backward in availing themselves of this privilege. Yesterday, December 6, mine were having fine sport, and this is very beneficial to them. All work and no play does as much harm to bees as boys. I find on making comparisons with the notices in newspapers, that as a rule the sporting days for the bees in the country are the same as the days of thick fog in London. Snow has not visited this locality yet, but as several places have been visited with heavy falls, bee-keepers must look well to the roofs. Everybody knows the penetrating powers of snow, so in no case allow it to stop on the hives, but brush it off at once, and never allow it to thaw, as it is sure to find a vulnerable point somewhere. It will also be well to keep snow away from the entrances, and also to sweep it away from the hives as far as possible. The dazzling brightness of snow, especially if the sun be shining on it, often causes the bees to come out, only to fall down and perish. Many people put something in front of their hives at this time of the year to prevent the sun shining into the hives, and thus keep the bees at home. This is a very good plan, especially on cold days. The cleansing flights ought to be restricted to fairly warm days.

APPLIANCES.

I said in my last article that now was the proper time to look after appliances. These things want to be done slowly and carefully. It is seldom that matters succeed in spring with the bees, if done in a careless and hurried manner. Some time ago hot controversies were going on about invertible frames. It seems to be now pretty generally conceded that it is a very good thing to invert section cases. The sections have not only been more rapidly completed, but have been better filled, and with less popholes. From various small experiments I have come to the conclusion that much good may result from the inversion of the frames in the body of the hive. In the case of a skep, it could be inverted at once, and without so much disturbance of the bees. Many frames have been devised, which will admit of inversion, but while these are made to hang on the sides I am afraid they will be too complex for general use. The simplest method seems to me, for the frame to stand on narrow strips at the bottom of the hive. The only possible objection to this style of frame is the danger to the queen during manipulation, but a careful bee-keeper would take care of her. I have invented a frame, which is the same at the bottom as the top, and there is nothing to move or shift prior to inversion. *Walter Chitty, Pinner.*

POTATO CULTURE ON THE FARM.

ONE might ask the question, How is it we see the Potato crop so miserably bad generally, and more especially among farmers? Where not grown as a specialty, now and then a very few of the latter step in and grow a crop, which causes in the district quite a sensation, but such cases are few and far between. Some few years since I gave an account in the columns of the *Gardeners' Chronicle* of an enormous crop grown near here on what was termed a bad piece of land, but what with using a different kind of manure, the latter not extravagantly employed, the land being well worked, and with plenty of space given for the Potatoes to grow in, the crop was acknowledged to be extraordinary, and was estimated to have been over 10 tons to the acre, and which was so stated in your columns. This was contradicted at the time, as to quantity; however, the fact remains, and my communication in your columns did good service in many places.

The following season Mr. Towler wrote to me to say that he had exceeded my estimate by 2 tons, consequently he had grown 12 tons to the acre on land adjoining his nursery at Northallerton; and I believe Mr. R. Dean stated in your columns

about the same time that a crop of 12 tons had been grown by him, or had come under his notice. My object in writing now is to show that to grow 12 tons to the acre is no difficult task to perform, if anything like moderate cultivation be adopted. The cowman here, has produced more than that quantity for the last three years on a very moderately fertile piece of land, the manure used being a small scattering of half-rotten stable-dung, and between 6 and 7 cwt. of specially prepared bones. The cost was not extravagant, but the result was a splendid crop of very fine Potatoes. I mentioned this result to Sir F. Milbank, and to my surprise he said he had just been informed of a person that had turned out 15 tons to the acre. Surely this ought to excite those farmers who hardly grow enough to pay for the taking up. *Magnam Bonam*, the Potatoes in question, are quoted in the London markets at from 65s. to 85s. per ton, here they ought to be worth 60s. per ton, which would make the produce of one acre worth £30. The cultivator should bear this in mind, and not forget the fact that he has no friend so generous as the soil, provided that he treats it liberally. A few years since, three farmers were walking through the kitchen garden here, when the men were digging a piece of ground for the winter, and one of them asked me what would be the consequence if he farmed in that style? He got a quick reply from the kitchen garden foreman—that his farm would need dividing into four parts, as he would not be able to house the produce.

An answer like this should afford food for reflection to those miserable tillers of the soil who have no spirit to fight against the times. Since I have lived in this place I have witnessed extremely low prices, and very low wages; I have also seen very high prices, injurious to all, except producers. The bad seasons have been against the farmers, as they have also been against most other trades. The market gardener gets no sympathy, whereas he oftentimes pays four times as much rent as does the farmer, and his losses from bad seasons are most disastrous. In our own neighbourhood the Potato crop should be more than doubled, to be at all satisfactory, and this might be done without much difficulty. *William Culverwell, Thorpe Ferris.*

TREES AND SHRUBS.

PATTON'S HEMLOCK SPRUCE (TSUGA PATTONIANA).

THIS is one of the Coniferae sent home to this country from North-west America by the unfortunate explorer, Jeffrey, and which is nearly related to canadensis. It is perfectly hardy in Britain, having withstood the severest frost here in the winter of 1879 so unscathed. The two specimens alluded to are growing each in a centre of two small clumps in the deer park on a rather high and exposed situation, and are about 12½ to 13 feet in height. The nurses or trees surrounding for shelter consists wholly of Larch and common Spruce, which have assisted them to make good growth of a fine glaucous hue. If this continues as they attain age and size, they will prove a valuable acquisition in parks and pleasure grounds. The character of growth is not quite so erect as that of the commoner kinds of Spruces, and is more in keeping with that of canadensis. As little has been reported of this Spruce since its introduction it may probably interest some of your readers to be made acquainted with its hardiness and the probability of becoming a valuable ornamental tree in this country. *J. H. Webster, Gordon Castle.* In Provost Russell's grounds near Falkirk a tree of this species or of *Hookeriana*, which is a slight form of it, was some years since said to be 14 feet in height and 11 feet through. *Ed.*

VERONICA PARVIFLORA.

On p. 758, a *Veronica*, now flowering in Mr. Wilson's garden at Wisley, is mentioned three times, twice by the name of *V. salicifolia*, and once by that of *V. angustifolia*. Mr. Wilson showed me the bush when I was in his garden a short time ago, and it is the species which at Kew goes by the name of *V. parviflora*, being far more floriferous and elegant in habit than what is called, at Kew, *V. salicifolia*. On the cold clay soil of my garden in Cheshire it is by far the best of the New Zealand *Veronics*, being the only one, except *V. Traversi* and *V. pinguifolia*, which has lived up through four successive winters. It grows 5 feet high and is covered with flowers for

nearly its whole height, and it begins to flower freely when quite a diminutive bush. It has a long flowering period, from early summer until stopped by severe frost.

Self sown seedlings often appear round the old plants, and, like those of many other plants, come up by preference on gravel walks. It does not seem to be grown in gardens as generally as it deserves to be. *C. Wolley Dod.*

Orchid Notes and Cleanings.

GOODYERA RODIGASIANA.

A SUPPOSED new species from New Guinea, with ovate acute leaves, dark green, with a central band of white. The flowers are at present not known. This and other plants of like character are cultivated by M. Linden in a compost of equal parts of peat, sphagnum, and charcoal, in well drained pots, which are frequently watered, but never with cold water. During the growing period the plants are kept in shade. The plant is figured in the *Illustration Horticole*, t. 616.

PHALANOPSIS, &c., AT HEATON HOUSE, CHESHUNT.

The Moth Orchids have occupied the attention of fanciers very much during the last few years; and nothing is more remarkable than the way in which these lovely but capricious Orchids succeed in some gardens, whilst in others, where the greatest skill is displayed and the best appliances for their culture are available, they do not give satisfaction. The omission of some minor detail may make all the difference between success and failure. The collection of Moth Orchids at this place belongs to J. Partington, Esq., and is under the care of an ardent cultivator, Mr. Szarin, who seems to have discovered the right treatment for them. The house in which they are growing faces the south—not the best position some would say; they are, however, the best cultivated specimens I ever saw. The vigour of the plants and strength of the flower-spikes are most remarkable. None of the plants seem to have lost a leaf for years. For instance, I noticed a plant of *P. grandiflora*, the Java variety: it has but one stem and thirteen leaves on it, the largest of them being 13 inches long, and 3 inches wide, producing one spike, on which are forty-one flowers.

P. Schilleriana had two very strong spikes showing, and six leaves, the largest 13 inches by 3½ inches. A remarkable specimen of *P. ambilis* had fifty-three flowers on a spike, with nine leaves on the plant. *P. violacea*, producing freely their distinct violet-purple and creamy tinted flowers, had leaves of great substance, 5 inches across. One specimen of *P. Schilleriana* had leaves a foot long, and 6 inches across. *P. Saderiana* was in flower in two varieties, one of them with broad overlapping sepals and petals, most lovely in its delicate rose-pink tint. Most of the plants are in baskets suspended from the roof, others are in baskets placed on the top of empty pots on the stage.

What is the treatment that has produced such remarkable results?—remarkable, not so much for the number and size of the leaves, as for their perfect condition. I certainly did not notice a single spot of decay on any leaf in the whole house, and every species and variety seemed alike healthy. The atmosphere of the house, what of that? This is perhaps most important at this season of the year. It was moderately dry, not close, and even stinging, as it too often the case. The night temperature now, and during winter, ranges from 62° to 65°, in summer, 70° to 75°—that of course would be attained by shutting up to utilise the sun-heat. The shading used for summer is William's new hot-house shading, and in hot sunshine mats are thrown over the shading. The plants are not much interfered with when once they are established in their Teak baskets; the largest proportion of the roots were outside the baskets, and in addition to this they had taken firm hold of the pots on which they were placed.

The other extreme of Orchid culture, the cool-house, was also well managed. The popular *Odontoglossum* was *O. crispum* producing many very strong spikes from fat glossy bulbs. I counted sixty-four unopened flower-buds on one branched spike of this species, which was stated to be an extra fine variety. *O.*

Inseleyi splendens had eleven flowers on a spike, and as Mr. Williams, in the *Orchid Grower's Manual*, states that six is the maximum, this may also be considered remarkable; the variety was very fine. I ought also to remark that Mr. Szarin has been handicapped, by having to grow his plants too much crowded together. Now new and well-appointed houses have been built, which will give the largest specimens sufficient space for more perfect development. *J. D.*

DENDROBIUM FALCONERI GIGANTEUM.

This Dendrobie, like *D. Wardianum* (says Mr. Williams), requires attention at all times of the year. During their season of growth the plants should be attended with care, also during the resting season. It is of great importance, for if they have too much drying up they do not like it; they should always be allowed to rest when their growth is completed, which period may be easily known by the last leaves at the top having completed their growth. The roots require to be kept moist up to that period; then when the growth of the stem is completed the quantity of water must be reduced, but they must never be kept so dry as to cause the stems to shrivel. When they begin to show flower a little water should be given, to plump the stems and encourage the flower-buds to develop in a proper form; and as soon as they start their young growths, let them go on so that they may ripen early, and be enabled to resist any strain that may be put upon them.

Rough peat and live sphagnum, with good drainage and a liberal supply of water during the growing season are requisite; they should therefore be syringed twice a day during summer in bright weather, but less frequently in autumn. The plants should be suspended near the light, as they require but little shade; they will also thrive in baskets and on blocks of wood, but when grown on blocks they require more moisture and more frequent attention as to the water supply. *Orchid Album.*

CYPRIPEDIUMS.

This genus of Orchids is so well known, and so widely appreciated, that it almost seems to be a waste of space to say a word about it; but we notice in our travels that the plants are often grown in very warm structures, and under strong shade. The former is not absolutely necessary, and the latter is positively a great evil. We can compare the short-leaved plants grown all the year round in a cool *Odontoglossum*-house very favourably against those where heat is greater. The flowering proclivities, too, are greatly enhanced in the cool structures. The colouring is much better also. There are probably some species which require more heat to complete their growth, but such kinds as *longifolium*, *Sedeni* (which has been flowering profusely with us during the last six months), *Harrisoni*, *insigne*, *i.* *Maulei*, *Hookeri*, *vexillarium*, and some others do not. Our *Odontoglossum*-house has air on from the front under the stage almost continuously; during the winter months the temperature averages 45° to 50°, but of course stands higher, while the temperature in the open air is at present over 50° in the shade. We have known some *Cypripediums*, particularly *C. insigne*, stand in rooms of various temperatures over six weeks, flowering freely all the time, and then be taken out apparently uninjured. A good hatch for decorative purposes during the present season is invaluable. *Caledonian.*

TRICHOSMA SVAUIS.

How often one hears of the increasing demand for cool Orchids, and yet at the same time there are some which possess all the qualities looked for, but which are seldom seen. Rarely is that little gem, *Trichosma svaui*, witnessed in good form. Here the plant carrying thirteen spikes on a plant in a 7-inch perforated pot seems quite at home in a cool-house. It has been in bloom for four weeks now. It is deliciously scented, is easily grown, and blooms freely during the dullest months of winter. *J. H.*

ANSELLIA CONGOENSIS.

A new species, introduced into Belgium from the Congo. Flowers in erect racemes. Sepals and petals greenish-yellow with numerous purplish-brown spots. Lateral lobes of the lip whitish and marked with purple veins, disc with two short, not very prominent keels, anterior lobe elongated, narrow oboval yellow. The plant was discovered by M. Auguste Linden, chief of the scientific expedition sent to the Congo by

M. Edouard Oulet. The plant is very free flowering, the ground being covered with the profusion of its flowers at the flowering period. *Lindley*, t. 640.

TSUGA CAROLINIANA.

It is certainly a remarkable fact that such a very distinct tree as the Carolina Hemlock should have escaped the notice of the early botanical travellers in the Southern Alleghany Mountains. Neither W. Bartram, who crossed the mountains where it is found as early as 1777, nor the Michaux, father and son, who ten years later made more than one visit to the same region, nor Fraser, who was with them, nor M. A. Curtis, who explored more fully than any of his predecessors or successors the botany of the Alleghanies, appear to have been aware that the flora of Eastern America contained two species of Hemlock. It was not until 1850 that Professor L. R. Gibbes, of Charleston, recognised an undescribed species in the Carolina Hemlock, for which he suggested several years later the provisional name (never published) of *Pinus laxa*, and it was only in 1881 that the species was properly characterised by Engelmann.*

From *Tsuga canadensis* the Carolina Hemlock may be distinguished by its larger, wider, and darker coloured leaves, six to ten lines long and nearly one line broad, retuse or often notched at the ends, without stomata above, and with two stomata bands below, and with strengthening cells (not found in the leaves of *T. canadensis*) under the epidermis on the keel, midrib, and edges; by its larger cones, ten to sixteen lines long, the scales oblong, longer than wide, spreading when ripe at nearly right angles, the broad bracts slightly cuspidate, the seeds less than half the length of the narrow wing.

The Carolina Hemlock is a small tree of compact pyramidal habit, with flattened spray, the branches densely clothed with dark green shining foliage, sometimes 50 or 60 feet in height, although the trunk rarely exceeds 2 feet in diameter. It is pretty widely distributed along the Blue Ridge west of the valley of the French Broad River in North Carolina, although nowhere common, and only a few individuals are found together in the same locality; it is strictly confined to the slopes and summits of dry rocky ridges, at an elevation of 2000 to 2500 feet above the sea level, where it is often found growing side by side with the more common *T. canadensis*.

The Carolina Hemlock is one of the most ornamental Conifers of Eastern America, recalling in its compact pyramidal habit and dense foliage, alpine specimens of the Western *Tsuga Fattoniana*. Although hardly known in cultivation yet, a few plants have been raised in the Arboretum. The climate of the region where it is found, however, indicates that *Tsuga caroliniana* will prove hardy in the Northern States and in Europe. The illustration on p. 781 is from a drawing made by my associate, Mr. C. F. Faxon, and is taken from a specimen which I collected in September upon Caesar's Head, an outlying spur of the Blue Ridge in South Carolina. C. S. Sargent, *Arnold Arboretum*.

HERBACEOUS PLANTS.

SCHISTOSTYLIS COCCINEA.—In spite of the cold and wet and fogs of our ungenial autumn for a South African plant, the subject under notice never fails to put in a respectable appearance in the shortening days of November. The open flowers do indeed get bespattered and spoiled when the weather is boisterous and stormy, but a few calm days induce them to resume their wonted brightness. The plant is perfectly hardy in the South of England, and I have seen it flourishing well in the open ground a long way north of the Tweed. The moister atmosphere in summer seems even more suitable to its likings than the dry atmosphere in summer in the neighbourhood of London. In fact, a long-continued drought, as occasionally happens there, has the effect of killing the plant entirely if grown in a heavy clay soil, liable to be baked and hardened by the sun. The same applies to plants grown in light sandy soil, as happened at Tooting a few years ago, when the wasting remains of previously healthy plants had to be potted up from the open ground to preserve them. The foliage withered away, and in their last efforts the plants seemed endeavouring to form small tubers. This is easily accounted for when we know the conditions under which they grow naturally. In the eastern parts of South Africa, in Kaffirland and

* *Identifications.*—*Tsuga* *caroliniana*, Engelmann in *Coultier's Botanical Gazette*, *Saxicola Forests of North America* ("Final Reports Tenth Census of United States"), vol. 38, p. 207. *Abies caroliniana*, Chapman, in the *Flora of the Southern States* (Supplement), p. 650.

the Katberg, where it occurs at an elevation of 3000 feet, the plant is found in wet places and never far from water: it increases rapidly, and is easily propagated by division. Those who have difficulty in growing the plant in the open ground on account of drought would do well to mix some peat with the soil and use water freely in dry weather. The plant is figured in the *Botanical Magazine*, t. 5422.

LYCHNIS PYRENAICA.

The dwarf character of this plant, and the fact of its being a native of rocky places in the Pyrenes, make this plant peculiarly adapted for rockwork, where, on account of its natural habit and likings, it may be inserted in crevices too narrow and confined for plants of larger and grosser dimensions. Plants of this kind are necessary on rockwork, in order to give it character, because we usually associate a great variety of plants on rockwork that have little in common as far as natural habitat is concerned or atmospheric conditions. The latter may be perfectly suitable for plants found naturally at low elevations, but with alps the case is altered, and we can only tide over difficulties by providing a great variety of conditions by variety of exposure and position. The alpine under notice was originally introduced in 1819, but has probably been lost and re-introduced several times since then. The figure in the *Botanical Magazine*, 3260, shows flowers of a decided pale or delicate rose colour, and most other descriptions of the plant seem to follow suit in this respect; but there is either a white variety, which is very possible, and even probable, seeing that such is very prevalent in the order, or the dull wet days of November have the effect of causing the flowers produced to develope white petals. The small glaucous leaves and compact habit of the plant are suitable accompaniments of the flowers. Propagation is easily effected by division, and by cuttings in sandy soil under a hand-light. *J. E.*

WHAT IS ORANGE PEEL?

THIS may seem a simple question, but it really is a difficult one to answer. The view now generally

FIG. 152.—A SCALY-RINDED ORANGE.

adopted is that it originates from the disc a sort of sheath visible at the base of the ovary of the flower, and which grows up from below, and eventually covers the carpels or quarters of the orange. Lately M. Naudin has favoured us with a sketch and description of a fruit found near Antibes by M. H. de Vilmorin. Here is M. Naudin's description of it:—

"The anomaly consists in the circumstance that the rind of the fruit is provided with projecting scales, terminating in a point, and arranged in regular spirals. In the axil of one of these scales I saw a rudimentary bud marked with two small tubercles, which appeared to me to be abortive leaves. If this be correct the disc which surrounds the base of the ovary is not a mere outgrowth from the axis, but is the axis itself, in which the carpels are imbedded, as in the Pomegranate, Apple, &c., but with this difference, that while in the plants just named the peduncle is fleshy and exterior to all the parts of the flower, the sheathing or tubular portion of the axis in Oranges is placed between the stamens and the carpels. This tube usually completely covers over the carpels, but is sometimes defective at the top, allowing the carpels to protrude. Sometimes, as in the fingered Citrons, the sheath does not develope, and the carpels then remain free as in a variety called Buddha's Fingers, a specimen of which may be seen in Mr. Hanbury's garden at La Mortola."

EMBELLISHING FORECOURT GARDENS, VASES, WINDOWLEDGES, &c.

WHAT a melancholy-looking, naked, and dreary appearance do the forecourt gardens and commodious window-ledges of hundreds of stately villa residences present to view during both summer and winter in the suburbs of large cities and towns, and especially in London. There are miles of whitened stone steps, pedestals, balustrades, &c., with a hideous glare of heat on them in summer—naked, cold, and cheerless in winter—that might be furnished—aye, and embellished too—by the employment of a few plants suited for the purpose, that can be grown in pots, and give but little trouble. In walking through an outdoor nursery many things present themselves to view as suited for the purpose. Then pots are cheap enough, and when properly potted in suitable soil they will last for a few years, if carefully looked to in the matter of watering. Evergreens should be employed for the purpose; they are suitable both for summer and winter. Some of the pleasantest and most attractive forecourt gardens round London are planted wholly with hardy evergreens, and they are, in consequence, at all times furnished, in mid-winter as in mid-summer.

Then look at the thousands of bold and prominent bay windows, having a broad exterior ledge, and not a particle of green to relieve the endless monotony of solid, naked white and grey. Window-boxes cost comparatively little, and when formed of proper materials, carefully put together and securely fixed, they will last for a long time; and when planted they give a remarkable aspect of finish and cosiness to a dwelling.

There are now many hardy evergreen shrubs so handsomely variegated as to supply tints not so bright as those of flowers truly, but highly effective and acceptable. There are hardy evergreen plants that would flower in window-boxes if properly tended. Mention may be made of *Berberis aquifolium* and *B. stenophylla*, *Andromeda floribunda*, *Kalmia latifolia*, the *Laurustinus*, and *Rhododendrons*, as illustrating the class of plant suited for the purpose. Of evergreen plants, plain and variegated, there are many equally well adapted to the end in view, such as *Aucuba japonica*, the dwarf green, golden-blotched, and silver-striped forms of the *Box*, *Cupressus Lawsoniana* and its varieties *albo-spica* *nana*, *pyramidalis*, *crecta viridis*, *gracilis*, and *lutea*; *Eunonymus radicans variegata*, *Juniperus virginiana* (the red Cedar), the round-leaved Laurel, *Osmanthus filicifolius*, both green and variegated; *Retinosporas filifera*, *plumosa*, *plumosa aurea*, *plumosa argentea*, *plumosa flavescens*, *alamosa variegata alba*, and *squarrosa*; *Rhododendron ponticum* and hybrid varieties, and the pretty *R. præcox* might be added to the flowering plants; *Thuia orientalis aurea*, *T. elegantissima aurea*, *T. semper aurea*, *T. occidentalis Elwangeriana*, and *T. Vervaeana*, and *Veronica Traversii*.

Here, then, is a select list of subjects that might be employed with great advantage in imparting life and warmth from January till December to our bare forecourt gardens and window sills. Plants of these can be had at a moderate cost, from 12 to 24 inches in height, small, bright, and compact, that would do well for potting, and would also grow into size and increase in value as year followed year. The *Andromedas*, *Kalmias*, and the *Rhododendrons* would need a peaty soil; the others would do well in a good yellow loam, mixed with which should be a little well decomposed manure and leaf-mould. If the plants were grown in pots they could be stood in the window boxes all the winter, with plenty of cocco-fibre pressed firmly about the pots, and removed in summer for flowering plants to take their place. Those standing in the forecourt garden would require to be well looked after in the matter of watering, especially in summer; be occasionally examined to see that the drainage in the pots was perfect, and a shift occasionally given to such as required it. The surface soil should be occasionally stirred without injuring the roots, and a little top-dressing added as required. Water should be carefully administered, so that the soil is not washed out to disfigure the stones upon which they were standing, and it would be a positive advantage to stand the plants in earthenware pots during the summer. *K. D.*

FORESTRY.

TRANSPLANTING OF LARGE PLANTS OR TREES.

THIS is a work which the forester or gardener has often to perform, and it at all times gives very considerable anxiety because the risks attendant are much greater than in ordinary planting. Having in a pretty extensive experience had a good deal of this to do, permit me to state shortly my views on the subject.

The object of transplanting large trees may be varied, but we will presume that the reason more generally is to produce quick landscape effect, or to give shelter. Frequently, however, some favourite individual tree may either be in a position where it is not seen, or where it is in the way of some proposed

that while in some cases, if done very carefully, and consequently expensively, that it may be successful, yet I am convinced that it is attended with greater risk than the course I would suggest and recommend.

The object in preparing trees for removal is to give growth a check before transplanting, more than to encourage the production of fibre, because I do not think that any small roots produced during the time of what I would call preparation is of much good, because being on the outside of the ball or root they invariably get dried up, or destroyed in the final removal. I therefore say the main object is to give a check, and to do this I cut a trench round, as near the tree as possible, only cutting the large roots and leaving the smaller untouched, fill up the trench again with the soil taken out, or it may be left open all summer, at the same time, if the trees to be removed are of the following kinds—*i.e.*, Oak, Ash, Elm, Lime, or even Maple. Cut in the heads by foreshorten-

from the fact that they are not always applicable to every situation, while they are expensive to keep up. It must, therefore, be left to the skill of the planter to use the means at his command for each individual case. The main point to be observed in transportation is to do as little injury as possible to the smaller roots, and if possible to secure as large a ball as may be consistent with transit.

When the plant has arrived at its new abode and is safely put in the ground care should be taken that the hole or pit be large enough to admit of the roots being spread out to their full extent; the common practice is then to put some rich soil next to the roots. Now I disapprove of this because it is liable to over-stimulate the already enervated functions of the roots, and do harm. I recommend instead that rather poor soil, such as a mixture of leaf-mould and sand, if convenient, should be applied, and that the original soil should be gradually filled

FIG. 153.—A NEW HEMLOCK-SPRUCE, *TSUGA CAROLINIANA*. (SEE P. 780.)

alteration of ornamental grounds; it is therefore desirable that it should be taken to a more suitable position. In the laying out of grounds ornamentally this forms a very considerable part of the work, because most people like to have an effect produced at once. The first consideration is the selection for this purpose of the trees to be removed; care should be taken that they are not in too sheltered a position, as such are liable to be soft and more susceptible of changes in site, soil, and exposure. The shrubs or trees being selected the next point is the preparing them. This should be done at least twelve months before. Now there are great differences of opinion as to the way in which this should be done. It has been recommended by some that a trench should be cut all round the tree proposed to be removed, the large roots cut, and the trench again filled up with good mould such as leaf-mould and sand, so as to encourage the production of fibre; this to be at a distance of 5 or 8 feet from the stem, according to the size of the tree, and the tree removed at the proper time with the whole head entire. Now I cannot agree with this: I think

ing the branches; in the case of Conifers, Beech or Plane trees, this cannot well be done, but in those mentioned it will be of immense advantage, both economically and otherwise. This should be done immediately after the leaves are off in the case of deciduous trees, say the month of October or November; in the case of Conifers and others in the spring, say February or March, not later than the first week.

REMOVAL.

This is perhaps the most anxious part of the work, and it must be done with great care. The proper season for the earlier prepared plants, and all deciduous trees, if they are to be planted in a sheltered position, is the following autumn, all evergreens in the late spring. The work of removal must depend very much on the size of plants or trees to be removed, and the distance from the point where they are to be transplanted. Many machines have been invented for this purpose, notably, McGlashen's and Barron's; and while each has its several advantages, none have come into general use,

in, during which time a plentiful supply of water should be used, to consolidate the soil—this going on simultaneously with the filling in of the earth. No tramping of the earth with the feet should be allowed, as that is always liable to bark the roots, besides leaving holes or vacancies in the ground. Water does this more effectually, besides tending to revive the partially parched and withered roots. The tree should then be steadied by six or eight cords from the main stem to the ground, care being taken that they do not chafe the bark.

This can easily be avoided by inserting a bunch of dry meadow hay or moss between the cords and the stem; I would also advise that the stem of the tree for, say, 2 or 3 feet from the ground, be bound round with soft ropes, made of meadow hay or other soft substance, and these allowed to remain until they fall off by decay; by this means a genial and cool moisture is always maintained round the stem, which is eminently beneficial to the health of the plant. In the case of evergreens during dry weather in spring and early summer, frequent syringing of the

head is most advantageous, as it arrests the partially weakened root-action necessary for the maintenance of the leaves, besides keeping the pores of the leaves in a healthy condition. C. S. F.

HARDWOOD TREES TO PLANT.

(Continued from p. 718.)

Birch and Alder.—For dampish ground either of the above trees are of particular value. They grow fast, arrive at maturity early, and are always sought after for the timber they produce, it having perhaps no rival in that ever-increasing industry—clog-making. We have no difficulty whatever in selling either of the above timbers at 10s. per foot, local demand rendering it quite unnecessary for the export of even a single load. For high-lying ground the Birch is invaluable, and when forming young plantations at great elevations a sprinkling of the tree in question is always to be recommended not only for the shelter it affords, but warm and ornamental appearance it imparts to the landscape.

Ash timber, although one of the most useful produced in this country, does not sell so readily as some other kinds, but as it cannot be done without the planting of young trees to take the place of such as have been cut down must be encouraged. A dearth of Ash timber would be serious, for its uses in the manufacture of farming and other implements are many and varied. Other trees that should, according to circumstances, soil, altitude, and exposure, enter largely into the composition of our woods and plantations are the English and Cornish Elms, the Norway Maple, Cherry, Poplar, and Willow, all of which, in some way or other, have good qualities that claim our attention.

The Willow for seaside planting has few equals, while its timber for pavements or bottoming of carts for stone traffic cannot be superseded, it never splitting, but teasing or wearing gradually away.

The *Cornish Elm* (*Ulmus cornubiensis*) is another excellent tree, whether for ornamental appearance or the value of the timber it produces. That it is so seldom seen is certainly to be regretted, but after a little, when its many good qualities become better known, we anticipate that as a lawn and general timber tree it will be held in high esteem. The timber is hard and beautifully grained, and has given the utmost satisfaction for repairs of boats, and as working kindly under the carpenter's tools.

As a general woodland tree, its fastigate habit of growth renders it peculiarly well adapted; while for embellishing the lawn and park grounds when appropriately placed it is a decided acquisition to the general run of our ornamental hard woods.

The *Spanish Chestnut* (*Castanea vesca*) is another tree whose valuable qualities will not allow us to pass it unnoticed. It is an excellent timber tree, of free, rapid growth, fairly accommodating as regards quality of soil in which it is planted, although preferring and attaining its greatest luxuriance in free open loam of good quality, and second-rate at least as regards value in an ornamental sense. For various purposes the timber is highly valued, that of good quality and mature age being in demand for cabinet work and as a substitute for Oak in the making of coffins.

We have but little difficulty in obtaining from 1s. 6d. to 1s. 8d. per foot for clear, large trees, more particularly when of sufficient size for the latter-named purpose. This tree should be planted in moderate quantity wherever free open spaces for its perfect development can be found.

NURSERY WORK.

As the various borders in the nursery become vacant have them trenched or deeply dug over, the soil at the same time being thrown up in as loose a manner as possible, so that it may receive the full benefit of the winter frosts. Such brakes or patches of the ground as are required for immediate re-planting should be levelled over, and if necessity demand such, as in most cases it will, a good top-dressing of thoroughly decayed farmyard manure or accumulations of leaf-mould and other nursery refuse applied. During fine open weather the transplanting of young stock, or such as it is not intended for permanent positions during the present season, should be actively engaged in, such work being got well in hand before the usual spring duties of the forester make fresh calls on his men and time. Where practicable the transplanting of young stock from the seed-beds may be deferred until early spring, and after the chances of

the usual recurrence of frosty weather are at an end. Too often does it happen that seedling plants lined out in early winter are lifted bodily from the soil by the influence of the frost, their roots being consequently much damaged, and the whole constitution of the plant impaired in a corresponding degree. In the event of seedling nursery stock becoming loosened through severe and long-continued frosts, we have found a dressing of fine-sifted soil to be of great value in setting matters right. Pine cones are unusually long in becoming ripe this season, this being no doubt attributable to the rather unfavourable unless summer and autumn through which we have passed. When collected place them in a dry, warm, and airy position, and allow the seeds to remain in them until wanted for planting in spring.

HEDGING.

Ordinary hedge trimming, ribbing in, and cutting over will still require attention, and may be engaged in from time to time where constant hedgers are not employed; but on every estate where the live fences are at all numerous a couple of practical hedgers should by all means be employed, as the efficient work performed by such is of great value in preserving the fences in a neat and creditable condition. Gaps in old fences will require looking to and planting up with strong, bushy, and rooted plants of the Quick, Hornbeam, or Beech. The formation of new hedges may still go on briskly—indeed, the sooner after the middle of November these are finished up the better, for as the Thorn is one of our first plants to start into growth, early planting can alone insure that vigour of growth and quick start away that is so desirable in every newly formed fence.

Where hedge plants are to be substituted for others that have died or otherwise got killed out, it is well first of all to remove the old soil as carefully as possible from the positions in which they are to be planted and substitute other of better quality from the woodland or adjoining fields. A. D. Webster.

Notices of Books.

The Future of the Date Palm in India. By E. Bonavia, M.P. (Calcutta: Thacker, Spink & Co.)

The author of this little book has been making strenuous efforts to further the progress of the cultivation of the Date Palm in India. No doubt in that vast country there are some districts—as in the Punjab and Sindh—where Date culture would be successful. The value of the fruit in periods of famine would be incalculable, for the Date tree, if the flowers were properly fertilised, would ripen its fruits abundantly in dry rainless seasons, when other crops would be likely to fail. Impressed with these facts, Dr. Bonavia has long exerted himself to secure the introduction into North-western India of the finest varieties of Arabian and Persian Dates, and has achieved a considerable amount of success, though it is obvious that to be of real service the matter must be taken up on a much more extensive scale than could be attempted by any individual. Moreover, there is a good deal of apathy and disinclination to new projects on the part of both natives and European officials to be contended with, and not a little ignorance. The fact that Date Palms have the sexes separate is not sufficiently known, and complaints are consequently made about infertility or imperfect ripening, the real cause—the absence of pollen-bearing flowers—not being thought of. It appears that in the Persian Gulf artificial fertilisation is always resorted to if first-class Dates are required, just as was done in olden times, and the same process should be resorted to in India. Dr. Bonavia recommends that the trees should be propagated by offsets from the best varieties of female plants, taking care to have a few male trees in each plantation. The offsets are planted 12–15 feet apart, and daily watered till they have struck root; or if planted in a nursery as a temporary measure they should be put in prepared soil 3 to 4 feet apart, and watered regularly. In the next rainy season the young plants can be carefully taken up, and placed in their permanent quarters. For this purpose, holes 2 feet each way should be dug, and the roots placed in a compost of soil, well-rotted leaves, and wood ashes. Watering should be carefully and regularly attended to. Surface dressings and mulchings are desirable, as retaining moisture and supplying nourishment. At first, Wheat, Barley, and other low-growing crops can be grown between the trees, but subsequently it is better to leave the Dates in full possession of the ground, for, as Dr. Bonavia truly

says, fine fruit can only be obtained by good cultivation.

Date stones should be sown in September or October in prepared beds of rich soil, the stones being 6 to 12 inches apart. Irrigation should be employed whenever necessary. After about a year the seedlings may be transplanted 12–15 feet apart, and daily watched and watered. A safer plan is to replant them about 3 feet apart in a second nursery in a shady site for another year before placing them in permanent quarters. There appears to be no special secret in the cultivation of the Date, but Dr. Bonavia emphasises the necessity for constant watchfulness and unremitting care, rather than special skill. There is a great deal of valuable information in this little book, and Dr. Bonavia's facts and arguments ought to carry conviction. India is not the only dependency where Date culture might be advantageously introduced. Some parts of subtropical and tropical Africa and Australia would probably be redeemed from barrenness by the introduction of these trees.

The Rosery.

ROSES AND ROSE STOCKS.

As I suppose most Rose lovers have before now purchased and planted their Roses (at least, they ought to have done so), any observations I may make now have reference to the future rather than to the present. There are a great many amateurs who like to bud their own plants, and it is to this point that I especially direct my observations. Any who have carefully read Mr. Douglas's remarks on what is necessary to be done in the Rose garden at this season will have made all secure for the winter, so far as possible. It has hitherto been a grand autumn time; we have had plenty of moisture, and now we are experiencing fine dry weather, with only slight hoar frosts, so that there can be no excuse for not being well forward with work. It may be that some may be hampered because the packages from the nurseries have not arrived; it is very tiresome, but they must be at their wits' end—the wet weather prevailed then lifting, and now that the dry weather has come there is, of course, a grand rush. Let not, however, the fineness of the weather induce amateurs to put off the mulching that ought to be on the beds now. We can never tell when sharp frost may come, and therefore it is well to be prepared. When it can be had I think there is little doubt that pig manure is the best, for delicately beautiful as the Rose is, she is, unhappily, a grass feeder; moreover, I do not think it encourages the growth of fungus so much as stable-yard manure, which is so often used.

It is, however, as I have said, with regard to the future I wish to write. Amateurs are fond of budding their own Roses, and the question is, what stocks are they to get in now for future work? A good many years ago I ventured to predict the disfranchisement of the standards, and although some ridiculed the idea, the prediction has been pretty well fulfilled. Wherever now do we go into a rosarian's garden and see any quantity of standards or Briars prepared for budding?—or, go into the Rose nurseries, where do we see the large quarters of standards that we used to see? And Canon Hole, even were he now, as in former days, a large Rose grower, might with equanimity notice the absence of his Rose man from church. By-the-bye, I met two of these Rose men yesterday—this neighbourhood is full of woods, copses, and hedgerows, yet the whole result of their day's work was "fifty Briars"—"terrible 'ard work surely it be too, maister." I do not think we need regret the loss of the standard Rose; its appearance was the acme of ugliness, unless its stem could be concealed—a tall stick with a head like a mop of Roses was not the way to show the queen of flowers to advantage; and then it had also this disadvantage—that in severe weather it readily succumbed to the frost. A few years ago I went to France, and visited the Rose gardens of my old friend Margottin where I saw one of the very best quarters of standards I had ever seen. I was also at Eric Comte Robert, where immense quantities of Roses were grown; the following winter was a severe one, and every one of these was killed. With dwarf Roses, on the other hand, you can protect them by mulching, and covering when needed, and

who cut down to the snow-line they will shoot up again, whereas the standard succumbs *in toto*.

Having thus discarded the standard in favour of dwarfs, there comes the question, What are to be the dwarfs? Shall the stock be Manetti, de la Grifferaie, Seedling Brier, or Brier cutting? A few years ago such question would have arisen. Manetti then reigned supreme, and I think there is no doubt that Mr. Rivers' introduction of that stock was one of the greatest boons to Rose growing that we have had; it enabled the Rose to be propagated as it had never been before, and it was not by any means a singular case for a nurseryman to have a quarter of a million of Manetti ready for budding, but it was found it was not the stock for many of the Teas. Then came the introduction by Mr. George Prince, of Oxford, of the seedling Brier; it was ridiculed at first, but it outlived the ridicule, and it became to be recognised as the stock for Teas, and the contention came to the front that it was, after all, the best stock for all Roses, and that opinion has been gradually gaining ground. Then the Brier cutting was especially encouraged by Mr. Ben Cant, of Colchester. There is a difference in the mode of rooting between the seedling Brier and the Brier cutting; the former sends its roots straight down, the Brier cutting spreads them horizontally; both alike form large quantities of fibrous roots, but the Brier cutting is easier for working. Some rosarians, amongst others your contributor "T. W. G.," have pronounced uncomplimentarily against the Manetti and in favour of the Brier. "T. W. G.," says, that if he had an offer of 1000 Roses on the Manetti he should refuse them. This is what is called "coming it pretty strong," but it indicates the depth of the writer's convictions, and certainly is an indication of the way matters are tending. Whether growers agree with this or not, now is the time for laying in their supply of stocks for next year, and they will do well to include in that supply either seedling Briers (which are constantly advertised in the gardening papers), or Brier cuttings. I have not seen stocks of these advertised, but probably they are to be obtained. It is too late now to strike them for another season, and those who wish to try them must either procure them at a nursery or be contented to wait.

I cannot make out "D. T. F.," I ventured to say that I thought that he would find that the best exhibition Roses would prove to be the best Roses also for garden decoration. He asks, if so, why does the National Rose Society publish a list of garden Roses, and offer prizes for them? Surely he must understand that the list of garden Roses (which is a name applied simply in distinction to exhibition Roses, and not because those in that portion of the catalogue are better for garden decoration) introduces us to different types of Roses, which may be useful enough for decorative purposes, but are not what are ordinarily termed show Roses. Let me say, too, that "D. T. F." makes it very hard to follow him. He stated that the National Rose Society did not have autumn shows because they did not pay, and when I showed that the Society received no benefit from their exhibitions, he says he did not introduce the paying subsidy. As to his last paragraph I have read and re-read it, but I confess it beats me. I at last concluded that he meant to take A. K. Williams as the type of an exhibition Rose and Gloire de Dijon of a garden Rose; if so, the comparison is unfair. In the first place Gloire de Dijon is often exhibited in many stands, and although not in the National Rose Society's list of exhibition Roses, is so marked in many catalogues; and in the second place, it is not fair to compare a climbing Rose, whose proper place is a wall, with a bush Rose. A. K. Williams ought to be compared with the Gallicas, Hybrid Bourbons, and Roses of that class. I believe, notwithstanding this, however, that A. K. Williams is a good garden Rose, as it is one of the most certain autumnal bloomer we have. Just one word more, "D. T. F." has, unhappily for himself, alluded to the Caledonian Horticultural Society's exhibition to back up his contention "about the advisability of holding autumn shows"—well, I was there, and I do not hesitate to say that in the amateurs' classes there was not one Rose which would have been admitted into a fourth-rate stand in July. There were two good stands for nurserymen—one from Aberdeen, far away North, and one from the North of Ireland, and therefore I do not think "D. T. F." has gained much by his reference to this exhibition. That nurserymen might get a fair stand in autumn we know, that amateurs have plenty

of flowers which are delightful and pleasing is also correct; but that is a very different thing, and I think most rosarians will agree with me that we had better enjoy the modest beauty of our autumn Roses at home. *W. H. Rose.*

CULTIVATION.

Plants which were placed in warmth early, so as to give a supply of bloom the last week in October and during the past month, will have got over their best bloom by this time, and will be breaking again, and showing quantities of buds. The plants will be benefited by having a coating of fibrous loam and bone-meal spread thinly, in which the roots will run freely, and strong growth will be thrown up, some of which will give as many as thirty buds and blooms. Keep the plants freely syringed on all fine days, and the troughs charged with liquid manure, otherwise the foliage will soon get infested with red-spider. Give manure-water freely to all growing plants; regulate all shoots as they get matured, so as to get the plants nicely furnished with them; introduce into this house, if space will permit, hybrid perpetuals which were forced last season and well cared for afterwards; these will produce flowers that will be acceptable in decorations, or for personal adornment. Sunset, a deep apricot colour, is becoming a great favourite here; it is beautiful in bud, and a fine forcing variety, producing an abundance of good and well-shaped flowers. W. F. Bennett (crimson Tea) is one of the greatest additions we have ever had in this class, being large and double, free-flowering, and very fragrant. *A. Evans, Lythe Hill, Haslemere.*

The Flower Garden.

CUTTINGS OF SHRUBS, &c.

CUTTINGS of Sweet Bay, Laurel, Ribes, Guelde Rose, and hosts of other subjects, may be put in to strike with a little heel of the old wood attached to the cuttings. It is a safer plan to open a perpendicular notch with a spade and place the cuttings against the face, than to dibble them in. You are more certain of the soil being firm around the base of the cuttings, which is a matter of great importance to their rooting speedily. Aucubas will root more satisfactorily if a glass case can be spared for their accommodation.

ROSE STOCKS.

As soon as possible a good stock of nice straight-stemmed plants should be secured of the Dog Rose for purposes of budding next season. These should be planted in well-prepared beds after having their roots trimmed of gnarled and useless wood. They should also be examined round the base under the ground level, and any eyes likely to develop suckers should be removed with the point of a knife. Where Manettis have been layered for the purposes of furnishing stocks for grafting, they may be removed from the stools, and either potted or planted in nursery lines. Continue to plant Roses as soon as received. Should any of the plants be found very dry in the roots, it is a good plan to steep the roots in water, or to make a puddle, and work the roots of such Roses in this till a considerable portion adheres to them, and then plant them. If the plants are in good condition, they may be planted forthwith.

STATIONS FOR TREES AND SHRUBS.

If notes were made earlier in the season where it was deemed necessary to introduce types of foliage to increase or produce effect, they should now be referred to. In sheltered positions the Alantus has a fine effect. Its characteristic foliage renders it one of the most desirable trees to plant in ornamental grounds, especially near water. Many of the new types of Oaks are also striking objects. Some of these produce enormous leaves, such as Dainio; while such as fastigiata, from its erect growing habit, is quite as effective as the Lombardy Poplar, and perfectly hardy, which the other is not. The various types of Maple must not be passed over. They are some of our most effective autumn trees, and the Japanese varieties are the most gorgeous of any trees yet introduced; most of them are perfectly hardy, and the foliage is invaluable for dinner-table work. The various colours of double and single Thorns

produce a splendid effect in combination with Ghent Azaleas and Rhododendrons, as well as single plants by the sides of walks. A goodly use should also be made of the Mountain Ash; it is very striking in autumn, and also looks well among Rhododendrons. *Garrya elliptica* is also a capital subject in a recess with a southern aspect. It is a shrub with dark green leaves, but it is its flowers which stamp it as an effective plant; they are produced in abundance, and depend from the shoots like Cob-nut catkins, only they are from 5 to 6 inches in length. It is a pity it is not quite hardy. Some very fine specimens here were destroyed in 1868-69, but they sprang again from the bottom. *Tilia asplenifolia* is a beautiful object to plant in shrubberies; when in flower it is so delicate as to rival the grace of ostrich plumes. *Wm. Baillie, Luton Ho.*

The Kitchen Garden.

EARLY FORCED POTATOS.

WHERE these are required during March, April, and onwards, the first planting should be made without delay; very good tubers may be grown in 10 or 11 inch pots, or in portable boxes. An advantage is gained by first starting the sets as advised in a former Calendar, by placing them in shallow boxes, covered with leaf soil, in gentle heat; care must, however, be taken that they do not remain in this position too long, but the tubers should be taken carefully out and planted as soon as the young shoots are prominent, and the formation of roots has commenced. After planting, and until the young growths are well above ground, a comparatively close temperature may be indulged in, but after this stage a more buoyant, airy one will be necessary, and which should be so regulated that the growth and foliage be robust and sturdy. When grown in pots these should be well drained, and filled rather more than half full of soil, made moderately firm; four sets will be enough for pots of the dimensions given, and which can be covered for the present with an inch or so of soil, the remainder being added later on, and when the haulm is well above the rims of the pots.

For Frames.—Whether heated by hot-water pipes or entirely by fermenting material, a slight bottom-heat is necessary in either case; when the latter method is adopted, a well constructed dung frame will of necessity be required, but where artificial heat is at command, a much less quantity will suffice, and may vary in depth from 2 feet upwards according to the construction or situation of the pit or frame to be filled—in either case, however, the contents should be so arranged that when finished and made ready for planting by having 9 inches of soil added, the surface should be within 15 or 18 inches of the glass; the sets should be planted in shallow drills from 1 foot to 15 inches asunder, and 9 inches apart, and afterwards, and before the haulm has got too high, a little more fresh soil should be added. All dung frames will require well covering to exclude frost, and this protection should be given from the time the sets are planted; the temperature also must be maintained by the renewal of and addition to the linings as the heat in them declines.

Soil.—If at hand, that in which Cucumbers or French Beans have been grown, with perhaps the addition of a little leaf soil and a sprinkling of soot, will be a very suitable one; but if soil has to be prepared, almost any light turfy loam, that has been stacked for at least six months will serve the purpose; this should be chopped up finely with the spade, and one-third of leaf-soil and thoroughly rotten dung, as from an old Mushroom bed added, and the whole be well mixed. If any specially fine clean tubers be desired a little more space in planting must be allowed, and the upper portion of the soil they are grown in sifted through a half-inch sieve, and a liberal addition of coarse sand added if it is deficient of that ingredient. *Water* should always be very sparingly applied to forced Potatos, especially in the earlier stages. As a rule none should be given until the growths are from 6 to 8 inches high, nor after that until the young tubers have formed and are swelling.

Varieties.—The most suitable for framework are selections of the Ashleaf section, these being alike good in quality and quantity, and make but small haulm.

EARLY HORN CARROTS.

The frame for these, if prepared as advised in a previous Calendar, will be ready for the reception of the seed, which should be sown in rows, and from 6 to 8 inches in depth. After being made firm and even, the seed should be sown in shallow drills 6 inches apart, and the frame afterwards kept close until the seeds germinate. *John Austin, Willey Court.*

Appointments for the Ensuing Week.

		SALES.
MONDAY, DEC. 20.	}	Sale of Roses, Fruit Trees, Plants, and Bulbs, at Stevens' Rooms.
TUESDAY, DEC. 21.		Sale of Orchids in Flower, at Protheroe & Morris' Rooms.
WEDNESDAY, DEC. 22.	}	Sale of Roses, Azaleas, &c., at the City Auction Rooms, by Protheroe & Morris.
THURSDAY, DEC. 23.		Sale of Plants and Liliun auratum, at Protheroe & Morris' Rooms.
		Sale of Orchids from Mr. F. Sander, twelve cases of Araucarias, &c., at Stevens' Rooms.

FIRST and foremost among plants suitable for Christmas decorations stands the Holly in all its more robust and beautiful varieties, green and gay. Among the latter we have many richly variegated golden and silver varieties. Unlike golden and silver Yews, and not a few other bright-leaved shrubs and trees, the Holly retains its maximum of beauty up to Christmas-tide. The berries, whether of the golden or coral-coloured varieties, provide such a display as no other group of plants can furnish. The mention of golden berries suggests the inquiry, why the golden-berried Holly is not more generally cultivated? It has always been scarce, and yet we have no golden-berried plant in any way equal to it, or that forms such a rich contrast with the glowing coral—the normal type of Holly berries. With abundance of Holly toned down a little with the silvery berries of the Mistletoe, hardly any other plant is needed to complete our Christmas decoration.

Unfortunately, however, this year the Holly, in some districts, was cleared of its berries nearly three weeks before Christmas. The birds have stolen a march on the decorators, and shorn the Holly of two-thirds of its glories as a decorative plant. The mere admirer of rich foliage plants will object to the proportions here stated, and it may be at once admitted that these are not material, and will be largely determined by matters of taste and sentiment. A practical question of considerable importance, however, pauses for solution, and that is the search for substitutes for Holly berries in districts where these either have not been produced this season, or where they have been prematurely devoured by birds.

And as it has been said of one or more great men, that none but themselves could be their equal, so it must be said of Holly berries; and as their non-production or destruction is seldom universal or general, a limited supply of them may mostly be forthcoming. The carriage of Holly boughs laden with berries is costly; a box of berries in singles or bunchlets, daintily picked, and packed to avoid bruising, would, however, cost but little for carriage, and go a long way in lighting up the boughs, if used with studied moderation and such tact as to give the impression of a natural example of a thin-berried season. Even in seasons such as this, when most or all of the most suitable branchlets for house or church decoration are stripped bare, a sufficiency of berries may not be found in out-of-the-way places for the embellishment of the green or variegated boughs. The berries are often found thinly dispersed, or on boughs with imperfect leaves, and it is quite a legitimate exercise of the decorative skill to transfer them from where they are useless or unseen to coigns of vantage where each berry or group of berries will add to the glowing beauty of the decoration.

In the absence of berries small Sweet or summer Peas rolled in red lead or vermilion, or

any other and more perfect mixture of red and golden Holly berries, form useful subjects for distant effects. Ivy berries are too large to be mistaken for Hollies, and if used in their natural state tend to throw the whole decoration into mourning.

The Pyracantha is magnificent when and where a sufficiency can be had, though in neither of its colours will it pass muster for Holly. Some of the larger-berried Thorns, too, are admirable, but they are mostly over too soon to be available for Christmas decoration. The Berberis aquifolium and some others, where they seed or berry freely, are useful, alike in leaf or berry; and where the Butcher's Broom or the Alexandrian Laurel abound, and berry freely, few plants give a richer or more chaste or brilliant touch to Christmas decorations. Then a few-berried branchlets of these well posted in a leafy grove of Yews—the latter richly clothed with their brilliant acorn-shaped berries—are extremely effective in combination with variegated Hollies without berries. Laurustinus berries, too, when obtainable, are exquisite for chaste decoration, and with these such Ivy-leaved and berried plants as some of the Cotonasters may be used. Hips, especially of the Sweet Brier, which are abundant this year, and Snowberries, are also most effective in large combinations, as are the feathery seed-vessels of the Traveller's Joy, Clematis flammula, and others. As to shrubs, it is hardly needful to go beyond Hollies and Yews, though for the fabrication of letters Box is useful and very tractable as a base, as are also the variegated and plain-leaved Eucyonius, the Japanese Honeysuckles, and other smallish foliage plants. The Sweet Bay, too, and all the Laurels, are often used for decoration on a large scale; but for brilliancy and staying properties there are no plants to match Holly, Yew, and Mistletoe, well clothed with berries. With these in good form, all things are possible; without them the most skilful decoration must be poor indeed.

ACTION OF POLLEN-TUBE ON THE OVARY.—It is well known to growers that the ovary of many Orchids, and also of the Banana, will swell and ripen even when no seed is formed. The explanation is that the pollen-tube in its passage down the style feeds on the contents of the cells with which it is in contact, and thus leads the life of a parasite. In so doing it brings about an afflux of nourishment to the part, and consequent swelling. Frequently the ovary has attained its full size before the ovules in its interior are fertilised.

THE BOTANICAL AND HORTICULTURAL SOCIETY OF DURHAM, NORTHUMBERLAND, AND NEWCASTLE-ON-TYNE.—The spring show will be held in the Town Hall, Newcastle-on-Tyne, on April 20 and 21 next. No summer show is intended to be held, but a large autumn show in the grounds of the Royal Jubilee Exhibition (to be held in Newcastle next year), the dates of this show being August 30 and 31 and September 1. This show is in conjunction with and will form part of the attractions of the Exhibition.

BAILLON'S "DICTIONNAIRE DE BOTANIQUE."—This most useful publication continues its slow growth. It is indispensable in all botanical libraries. Detailed as it is, there are some notable omissions; thus, under "Hartweg," not a word is said of his travels in Mexico; nor are HARVEY's long residence at the Cape, nor his travels in Australia mentioned. "Bindweed" is given as the English name for *Convolvulus arvensis* instead of Bindweed, but these matters are but trifles compared to the general excellence of the book.

"THE BOTANICAL MAGAZINE."—The hundredth anniversary of the *Botanical Magazine* has just been reached. No publication of its kind has attained anything like the same age, and none has been so useful. A glance through the back volumes supplies an epitome of the high-class horticulture of

the period. We hope shortly to be able to lay before our readers some comments on this subject. The present volume is dedicated by the Editor, Sir JOSEPH HOOKER, to Sir TREVOR LAWRENCE, the President of the Royal Horticultural Society, in the following terms:—"Allow me on this, the hundredth anniversary of the *Botanical Magazine*, to dedicate to you, as President of the Royal Horticultural Society, the volume that is the evidence of this work having attained a longevity far exceeding that of any other botanical or horticultural serial. Whist thus commemorating your service to horticulture I would associate with your name that of the lady from whom you directly inherit your love of plants and your passion for gardening—the late Mrs. LAWRENCE, of Ealing Park, whose liberality and whose rich and beautiful conservatories were set forth by my predecessor in the dedication to her of the sixty-eighth volume (published in 1842) of this work, and whose kindness to myself when a very young botanist I shall ever hold in grateful remembrance."

CULTURE OF PEPPERMINT.—The following remarks are extracted from a paper on oil of Peppermint, read at a meeting of the American Pharmaceutical Association:—"The industry in England reached its zenith about 1850, just 100 years after its introduction, when the area cultivated was about 1500 acres, but, owing to successful American competition, it was reduced during the next fifteen years to about 250 acres. From personal observation when visiting the Peppermint districts of England in 1875, I attribute the success of American competition to a more perfect system of distillation and apparatus therefor, and the more healthful growth of the plants in our country."

CACTUS SPIRIT.—In Spain Don FERNANDO DE LA CAMARA recommends the employment of the fruit of the Prickly Pear—*Opuntia vulgaris*—for the manufacture of alcohol. As this plant is very common in many of our tropical and subtropical dependencies it may be worth the consideration of some of our Colonial friends.

ROYAL NORTHERN HORTICULTURAL SOCIETY OF ABERDEEN.—At a meeting of the acting directors of this Society, held in the Secretary's office, Union Street, Aberdeen, on Friday evening, 10th inst., Town-Councillor LYON was unanimously re-elected Chairman, and Major CROMBIE, Vice-Chairman.

LEAVES OF PINES.—Messrs. COULTER and ROSE have published in the November number of the *Botanical Gazette* a synopsis of the North American species of Pinus based upon the microscopical anatomy of the leaves. It is not likely that gardeners or foresters of this generation will avail themselves of this means of discriminating the species, which, nevertheless, for botanical purposes, is very useful.

TROWBRIDGE HORTICULTURAL SOCIETY.—This Society is in so prosperous a financial condition as to excite the envy of many a committee whose ventures have turned out less successfully. The Hon. Sec., Mr. J. HUNTLEY, reports that the annual show in August last realised a profit of over £30, and the balance in favour of the Society is now just over £445—truly a very satisfactory state of things. A desire has been expressed that the Society should hold a Chrysanthemum show next November, but whether it will be carried out remains to be seen.

FASCICATED ROOTS.—Mr. BURBIDGE has been kind enough to send us a specimen of a Japanese Piper in which the aerial roots are flattened out into broad masses like the outlets of an elk in miniature, but covered with a rich investment of brown velvety hairs like that covering the inflorescence of the Smuch. Under normal circumstances the tip of a root has but one growing point. In these cases from over-nutrition several are formed, but they remain for the most part encircled by a continuous band of cellular tissue, so that they do not separate, or only to a slight extent, into separate rootlets, but remain in the form of a flattened band.

THE PHYLLONERA LAWS.—There would appear to be some hope that the absurd restrictions on the commerce in plants are about to be made somewhat easier in the German Empire for nurserymen and others living in England and other countries that have not joined the Phylloxera Convention.

THE PHOTO. BRUNNEN & CO. GARDENERS' CHRONICLE, LONDON, E.C.

MESSES R & T VEITCHS GROUP OF PLANTS AT THE EXETER FLOWER SHOW

The Imperial Chancery has recently asked the opinion of the government of Saxony in regard to these laws, which has replied that it appeared to be desirable to admit plants and vegetables, with the sole exception of Grape Vines, under the condition that these are examined and pronounced to be free from Phylloxera by experts at the frontier station.

— FLORAL FASHIONS.—Within the last few years a great change has been wrought in the style of making up flowers for personal adornment. A few years back the idea of using Ivy leaves that had become discoloured by exposure would have been considered absurd; yet at the present time their use has become general; and the once indispensable Maidenhair Fern is falling more and more into disuse, for besides Ivy leaves, many other kinds of foliage are used. The Ivy leaves that are used are mostly imported from France; they are rather small in size, and of a beautiful bronzy hue, and when nicely worked up they are very effective; besides which they last well, where Maidenhair Fern would quickly perish. In all kinds of floral arrangements various sorts of coloured foliage are very extensively used, and when brought in combination with flowers of distinct colours it is certainly more appropriate than the indiscriminate use of Maidenhair Fern.

— FLORAL DEVICES.—Our American cousins, so often in advance of us, are at least a half-century behind in the matter of floral devices. The absurd monstrosities now scarcely ever seen in this country, even at a village flower show, seem to be in full favour across the Atlantic. The following incident, related in an American paper, may help to banish an absurd custom:—"As the curtain went down after the second act of *Miss Milton* last night an usher rushed down the middle aisle of the theatre bearing a most unique floral device. It looked much like a big baby swaddled in white laces, with its little red head protruding. Some of the audience took it for a snow man with a piece of red flannel around its throat. As *Miss Morris* received the offering and wrestled it behind the curtain she looked much bewildered. It was, in fact, a floral representation of 'Liberty enlightening the world.' The florist had used poetic licence with Liberty, however, and as a result she was lop-sided, one-armed, legless, and grinning."

— LONCHOCARPUS BARTERI.—The members of this rather extensive genus show a considerable range of variation, some being trees with upright habit, while others are climbers or twiners. The species under notice is so habituated, and ascends trees in its native haunts in tropical Africa to a great height. This latter fact is its most serious drawback, and will weigh heavily with cultivators in this country on account of the extent of house-room, or in other words the length of rafter required to grow it to a flowering state. In the Palm-house at Kew, where it has been growing and gaining strength for some years, flowers have at length been produced in tolerable abundance in the upper reaches of its great twining stems. Planted in one of the beds, it ascends a pillar supporting the gallery, rambling extensively over the railings of the latter, and finally ascends some wires reaching nearly to the highest part of the roof. The Pea-like flowers are rose coloured and rather small, but numerous, in large axillary panicles or compound racemes, produced on the stems near the glass toward the top of the house. Under such conditions, visitors in the lower part of the house, would never become aware of their presence, but seen from the gallery they are sufficiently conspicuous to attract attention. The final ascent on the wires near the glass seems to have been favourable to the production of flowers.

— KAPOK.—Under this Malayan name the Silk-cotton tree of India and the Archipelago, and which is indeed common throughout the tropics, is known. Botanically it is the *Eriodendron anfractuansum*, a plant well known to botanists, and, when collecting seed-vessels was in vogue some forty years ago, to amateurs also. It was always a mystery why the silky fibres attached to the seeds of this plant in such profusion, were not utilised. Certainly it was from no fault of the botanists. Now we learn that it forms a large item in Australian trade, Melbourne being now supplied from India and Ceylon. It is chiefly used for upholstery purposes. In 1886, 7995 bales, worth between £26,000 and £27,000, were imported, prin-

cipally from Java, where special care is taken in cleansing and packing the fibre.

— HONOURS TO CALIFORNIAN BOTANISTS.—Professor and Mrs. J. G. LEMMON, who toiled so devotedly to have the products and capabilities of the Pacific coast worthily represented at New Orleans during the winter of 1884-85, have, we learn from an American paper, lately received from the management of the World's Exposition, held then and there, six certificates of awards in the First Degree of Merit, accompanied by prizes in money, as follows:—1. Largest and best exhibit-flora of North America. 2. Largest and best exhibit-flora of the Pacific Slope. 3. Largest and best exhibit forage grasses, sedge, and other plants. 4. Largest and best exhibit seaweed and rare Ferns and flowering plants. 5. Largest and best exhibit-paintings of rare and beautiful plants, made in the field with water colours (awarded to Mrs. LEMMON). 6. Largest and best exhibit indigenous (Arizona) Potatoes, represented by botanical specimens, live tubers, and water colour paintings.

— "THE PRESS AND HORTICULTURE."—Mr. HERBERT MYRICK, of Massachusetts, made the following remarks at the seventh annual meeting of the American Horticultural Society, but much of what he said applies equally to this country. We do not think the Press is to blame. They cannot be pressed and dealers at the same time:—"The Press has done much to encourage the fruit-growing for the home, but it has done little toward telling how to sell fruit. The space between the producer and the consumer is too wide. The fruit-grower wants the Press to aid him in co-operative selling. The Press may also be used to discover new markets in this and other countries. Reports of fruit crops have been generally neglected, but these reports should be looked after. The reports should cover the whole country. If the Press had done its whole duty toward horticulture, Congress ere this would have passed the Hatch Experimental Station Bill, which appropriated 15,000 dollars to every State Agricultural College for the founding of the stations. The Press and farmers have been very silent regarding the passage of this Bill. Many papers refuse to notice new fruits and patented inventions for fear of advertising some one. The subscriber wants his journal to describe new fruits before the news is stale. The dealers' and nurserymen's papers are good, although they are generally advertisements for the proprietors. The horticulturists should write for the Press. These writers are few. Men who have never written for the Press sometimes send the best of news founded upon experience. Local horticulturists should keep local papers informed of their proceedings."

— BENT TWIGGS.—Professor SORAUER has been investigating the method of bending twigs of fruit trees for the purpose of enhancing their fertility. When a branch is bent acutely, the bark on the lower surface is thrown into transverse folds here and there detached from the wood. In these little cavities new woody tissue is formed filled with starch grains, and afterwards new woody tissue of a normal character, but always thicker than elsewhere, and especially on the upper convex surface. The mass of woody tissue checks the flow of water towards the tip of the branch, to the great advantage of the bud immediately beneath, and which is thus the more likely to develop as a fruit bud.

— LEARN TO OBSERVE.—Writing in the *American Florist* "T. K." says:—"Take notice of all your plants from day to day. Keep in mind the treatment you have subjected them to, and note the slightest change in their appearance, and the cause of the same. You will then have made a start in the right direction, for the florist or gardener who errs, and finds the true cause of his failure, has learned something; but he who lays his failure to the wrong cause has not. By constant observation one may soon learn to judge a plant by its appearance, and after a time become sufficiently expert to be able to tell at a glance, or simply by feeling of the foliage, or both, to what treatment a plant has been subjected, whether kept too warm, too cool, too wet, or too dry, or just right, and be guided accordingly. Observe the appearance of plants in perfect health in some successful grower's collection, and keep in mind the appearance of the same; strive to get yours in the

same condition, and never be satisfied until you do. Persevere, do not get discouraged, and you will be successful in the end. It is better to learn by observation than to follow instructions laid down by those who are working under vastly different conditions generally, as you can then work in accordance with your surroundings."

— CATASETUM BUNGEROTHII.—A short time since Mr. BROWN described in the *Lindenia* a new *Catasetum* under this name, and a coloured representation was given at the same time (t. 57). Of necessity, both description and plate left much to be desired. The latter was especially unsatisfactory, and the Editors of the *Lindenia* will now, doubtless, speedily publish another plate, and so render justice to an ill-used plant. A living specimen was shown by the Compagnie Continentale of Ghent, at STEVENS' Sale-room on Thursday last, and which at any rate bore out the assertion that this is one of the most remarkable Orchids of recent introduction. The plant in question had five spindle-shaped pseudobulbs, from the base of one of which issued a raceme with seven saucer-shaped flowers of ivory-white colour, each about 4 inches in diameter in each direction, with oblong-acute sepals and petals, the petals broader and longer than the sepals, and ascending vertically almost parallel to the median sepal. The concave lip is broadly ovate-acute or shovel-shaped, pure white, with an orange blotch surrounding the entrance to the short stout concave spur. The column is stout, white, with the anther prolonged upwards into a long thread-like tail, and with two thread-like processes or antennae on either side at the base, after the fashion of male-flowered *Catasetums* in general. The irritability of these antennae is well known—touch them and away fly the pollinia, to be attached to some intruding insect, which forthwith flies off to some other flower of the opposite sex and effects the fertilisation of the ovules. The present flower is, as it were, two-lipped in appearance, the lateral petals with the median sepal constituting one slightly concave lip, the median petal or labellum forming the other lip. The large size and bold outline of the flowers, their firm substance, persistent duration, and attractive colour, to say nothing of the botanical interest attaching to it, should render this plant specially attractive to Orchid growers. It has all the appearance as if it would respond to the cultivator's art, and, if so, we may confidently expect it to become one of the finest 'specimen Orchids' at future exhibitions. We hope shortly to be able to give an illustration of this superb flower.

— DESICCATED SOUP.—At the recent Potato Tercentenary Exhibition we met with some samples of EDWARDS' desiccated soup, to be obtained of the agents, Messrs. KING & Co., Bishopsgate Avenue. It is composed of beef and Potatoes desiccated, ground, and flavoured with Celery seed in some cases. It appears to be both a useful and palatable preparation where soup is required at short notice, while it makes excellent gravy for poultry, &c., at small cost—1*d.* per small packet.

— FARTHING DINNERS.—Mr. GEORGE HERBERT SARGANT, Colmore Road, Birmingham, has published a valuable little pamphlet, containing full directions for supplying to the poor nutritious dinners of soup and vegetables, &c., at the cost of one farthing per head. The price of the materials and the quantities to be used are given, together with such clear directions for cooking, that to blunder in the preparation of them would seem to be a total impossibility. The number of ladles, spoons, basins, cans, buckets, tables, trestles, towels, cloths, mops, &c., needed, is detailed and the prices given; while even the "pigswash tub" to hold the refuse is not forgotten. We heartily commend this little book to all those who are trying to establish a soup kitchen during the coming winter, and can assure them they will find the pamphlet full of valuable hints, calculated to ensure the success of their undertaking, and to save themselves a great deal of trouble and unnecessary outlay.

— HORTICULTURAL CLUB.—The usual monthly dinner of the Club was held on Tuesday last at the rooms, 1, Henrietta Street, Covent Garden. Among those present were the Hon. and Rev. J. T. Boscawen, Messrs. B. F. Kaines, W. H. Pearson, A. H. Pearson, Jeffries, G. Bunyard, Rev. W. Wilks, &c.

The subject for discussion was opened by Mr. T. F. Rivers on "Pears and their Culture," and a very interesting discussion followed, in which many important facts were elicited.

— SHOWS FOR 1887.—Wednesday, August 17, has been fixed for the summer show of the Devon and Exeter Horticultural Society, and Friday, November 4, for their autumn show at Exeter.

— ESSEX FIELD CLUB.—The Council of the Essex Field Club has determined in future to issue the "Transactions" and "Proceedings" of the Club combined in the form of a monthly periodical entitled "The Essex Naturalist, being the Journal of the Essex Field Club." The Journal will contain papers read before the Club, reports of past and announcements of future meetings, and, as space allows, notes and communications upon any matters of interest connected with the natural history, botany, geology, and prehistoric archeology of Essex. We believe that this is a new departure in the policy of local societies, at least in the South of England, but the plan has been adopted by the Essex Club from a rapidly growing conviction that if local societies are to flourish and do useful work, it is necessary to devise some means of "keeping touch" with their members, and encouraging intercommunication among them. The first number of the "Essex Naturalist" will appear in January next, and will be conducted by Mr. W. COLE, who has edited the publications of the Club since its establishment, seven years ago.

— ONEFA PULCHELLA.—The members of this genus form a small group of woody climbing plants, with much the same habit as that of *Clerodendron Thomsonae*, and they are indeed members of the Verberna family, and closely allied to *Clerodendron* itself. They are natives of New Caledonia, but very little known in this country. Rarely do we find any record of any of them in books coming within reach of the gardener, and even then the species under notice is the only one mentioned. As might be concluded, a plant so little known in current literature would be less known in a cultivated state. A plant of some considerable size flowered recently, and may still be in that condition at Pendell Court, where it elbows its way amongst numerous other rare or little known subjects that seldom obtain a footing at other private establishments. The white flowers are produced in axillary cymes towards the top of long slender climbing stems. The leaves are opposite and smaller than those of the *Clerodendron* above mentioned. It is planted out in a border against the back wall of a stove, a kind of treatment doubtless more congenial to it than if confined for root-room to the narrow compass of a pot, in which, however, it is possible to flower it. Rich light loam mixed with a small quantity of peat, well rotted dung, and sharp sand to keep the whole open will suffice to grow the plant whether in pots or planted out.

— THUNBERGIA MYSORENSIS.—In general appearance this species is very unlike the *Thunbergias* proper, and which are generally recognised in gardens as such. Of course the old genera *Hexacentris* and *Meyenia* have been sunk in that of *Thunbergia* by the *Genera Plantarum*, owing to the trifling differences, botanically speaking, that serve to separate the three. There are five species belonging to the section of which this is a member, and all are natives of Asia, principally of India. The flowers are produced in long, pendent racemes terminating the stems or on short axillary branches. The corolla is bilabiate and yellow, with five obtuse, reflexed, crimson lobes, quite unlike the wide, open-mouthed, true *Thunbergias*, such as *T. Harrisii*, *T. grandiflora*, or *T. laurifolia*. The drooping, many-flowered racemes are very conspicuous and telling when in full flower, owing to the peculiar colouring of the lobes of the corolla, which may be variously described as crimson, or a mixture of orange and scarlet, according to its intensity and the way in which it blends into the yellow tube of the flower. In shape the latter recalls the flowers of *Mimulus cardinalis* in no slight degree. In habit this species associates with *Thunbergia* proper, and requires the same moist, warm, temperature and cultural treatment. Owing to the great length of the climbing stems the plant does best when grown planted out in a border. It may be seen trained up near the glass in the Palm-house at Kew,

and there is a figure of the species in *Faxton's Flower Garden*, iii., 88.

— MISTLETO FOR CHRISTMAS.—During the past few days large quantities of Mistleto have arrived in the port of London from Boulogne, Havre, Bordeaux, and other French ports. The Mistleto comes to London chiefly from Brittany and Normandy, in which provinces the parasitic plant grows on trees in abundance; but this year there has been a new departure, as far as British Mistleto is concerned, several tons of the plant, gathered mainly on the Welsh border of Moemonthshire, having, it is said, been shipped from London to New York, as it is stated that amongst large numbers of genuine English settlers in the United States so general a desire has been expressed to have sprigs of British Mistleto at Christmas that it has been made worth the while of speculators to have it brought out from England. Covent Garden Market is at present well stocked with Mistleto.

— A POTATO SOCIETY.—There is a marked tendency, now-a-days, toward specialisation in all things; but while admitting the fact we do not see why the Royal Horticultural Society may not recognise this and act accordingly. If it will not do so, then the specialists will have twofold right on their side. Meanwhile we point out the genuine grievance there is of individuals being virtually compelled by this multiplication of small bodies to expend many guineas where comparatively few would suffice. So far as Potatoes are concerned, we cannot see how or why any all-round gardener may not, for all practical purposes, master all the details relating to their cultivation. The Potato surely stands in no need of such assistance as a special society could render. The following communication, advocating a somewhat different view, has been handed to us for publication:—"As I have something to do with the proposal to form a Potato Society, I should like to say that in doing so I have no wish whatever to offer any form of opposition to the Royal Horticultural Society. I regret exceedingly the lack of capacity and comprehensiveness shown by that Society, which seems literally to drive friends from it rather than to attract them, when, in regard to its designation and the relative importance of its associations in the horticultural world, it should occupy a bold, dignified, and independent position. It is all very well to say that the Royal Horticultural Society should be the instrument for performing all the work we look for at the hands of special societies; but perhaps it would be as fair to assert that a comprehensive society like the Royal Society should perform all the sectional work so ably done by the Linnean, Geological, Geographical, and other scientific bodies. It now seems more and more evident that if such is to be done well it should be performed by special bodies. Turning to agriculture, we see even with the existence of such an eminent and capable body as the Royal Agricultural Society, and one so widely supported, that there still is found ample room for Cart Horse, Fat Cattle, Dairy, and other special bodies, all doubtless doing good work, and not improbably doing it better than the Royal Agricultural Society could do, because devoting special and not general attention to it. Then special societies are found to attract to them those who have special affinities with the subject to be supported. In horticulture we have as many, perhaps even more, phases of thought and practice than in agriculture, and as no man can be a specialist in everything it is certain that he will be attracted to those particular subjects, with which he has the greatest sympathy. I presume no one now imagines that the Royal Horticultural Society could perform the work of the National Rose or Chrysanthemum Societies with anything like the zeal and interest shown in them by their respective supporters. There are in the composition of their governing bodies no opposing interests, but in a large homogeneous body, such as the Royal Horticultural Society should be, indifference on the one hand might seriously help to cripple the earnestness of specialists in another direction, and thus on every hand no special work would be effectually done. I think the Royal Horticultural Society should strive to make itself as useful as possible in its particular line, and, while not viewing special societies with any jealousy, rather strive to attach them to itself by acts of sympathy and appreciation rather than to repel them by coldness. If the Royal Horticultural Society had, as you suggest,

a really central and available home in London, how gladly, I am sure, would special societies avail themselves of it for that special purpose, and thus serve to render the senior body help. As it is the Royal Horticultural Society is in London homeless, and it has no shelter for itself, let alone for other junior but still sympathising bodies.

— VITALITY OF SEED.—SIR WALTER ELLIOT communicates to the Agri-Horticultural Society of Madras a case in which seeds of *Pipturus Qatmoedi*, gathered in India in 1859, were sown in England in 1881, when they germinated after a rest of more than twenty years.

— GARDENING APPOINTMENTS.—Mr. C. SOLMAN, late Foreman at Cassiobury Park, Watford, Herts, has been appointed Gardener to J. J. SUDBURY, Esq., Woensh Park, Guildford, Surrey.—H. PETERS, late of The Gardens, Waddesden Manor, Aylesbury, as Gardener to ALFRED TATE, Esq., Rosleigh, Woolton, near Liverpool.

THE ORCHID HOUSES.

GENERAL REMARKS.

ALTHOUGH not the growing season of Orchids, the next three months will be an anxious time for those in charge of collections. It will be necessary for those attending the fires to be on the alert, so as to keep up a uniform temperature in the various houses. Thanks to the improved forms of boilers, and the more skillful laying of hot-water pipes, these long winter days are reduced to a certain extent; and while we continue to keep the boilers well beneath the houses which have to be warmed, we can always depend on their doing efficient service for some hours without attention. We hear of boilers that will take care of themselves for twelve hours at a time. This might do for dwelling-houses or rooms with thick walls and a ceiling; in such places the outside changes do not affect the temperature so suddenly as is the case in a glass-house. In the latter the stoker has to guard as much against a sudden rise in the outside temperature as against fall; otherwise plants that should be kept at rest get started into premature growth. None but a novice in Orchid growing would be pleased to see his plants that might not be doing well continue making rapid growth. There can be no rule laid down in regard to heating and watering for each day at this season; but it will be found that during and after strong winds the houses and plants will dry up quickly, and will require as much moisture in one day as in two or three dull, mild days. Orchids that have leaves to support during winter other than those with pseudobulbs, will often suffer more quickly when much fire heat is used, if dry at the roots, than they would if stunted of water during summer days. I think some growers of Orchids are likely to err in winter by keeping the atmosphere too dry, and the roots of the plants too wet; in such cases of doubt the hygrometer is the best guide as to the state of the atmosphere in the

houses; it is not necessary to have one for each house, but one should be placed in any house for a few days, when there is any doubt left about the aerial conditions. Slugs are apt to be busy with the *Masdevallias* and cool *Odontoglossums*, therefore look closely for the depredators each day at daybreak. They may be sought for in the evening with a bull's-eye lantern.

It will improve the colour of the flowers of *Calanthe Veitchii*, now opening, if the plants be placed in the lightest part of the East Indian-house, and any of the deciduous type can be removed into a Cattleya-house when nearly all the flowers are expanded; this tends to strengthen them, so that they last longer when cut. Very little water is necessary after the leaves have fallen, and the plants are in full bloom. *C. Woolford, Downside.*

FRUITS UNDER GLASS.

PEACH AND NECTARINE TREES.

The trees in late houses should be pruned forthwith, the glass, woodwork, and other parts made clean and sweet. As much of the old wood as can be spared must be cut out, as well as extra strong shoots made in the past season, and some of those left should be shortened back to a wood-bud where necessary to secure a sufficiency of shoots. This done, the trees if affected with blight should be carefully washed with soft soap (4 oz.), dissolved in a gallon of warm water, adding two handfuls of sulphur well mixed; and should scale exist on the trees, a winglassful of petroleum should be added to the solution. Train the shoots 5 inches from each other at an equal angle on either side of the tree, leaving sufficient room in the ties for the wood to expand. The surface of the border should then be pricked over with a fork; the loose soil removed and replaced with a mixture consisting of three parts good loam and one of old mortar rubble and wood-ashes, following this with a mulching of horse-droppings or short dung to the thickness of 2 inches, and a good watering.

FIG TREES.

The trees in late houses should be attended to, and treated as recommended in the *Gardeners' Chronicle* for November 13, p. 632.

THE GRAPE-ROOM.

A dry equable temperature of about 50° should be maintained here. Look the bunches over three or four times a week, and remove any bad berries that may be in them. *H. W. Ward, Longford Castle.*

PLANTS AND THEIR CULTURE.

CHRYSANTHEMUMS.

THESE will now be past their best, and where late plants are in bloom keep the conditions as favourable as possible for the preservation of the flowers; damp is the chief enemy, and must be combated by applying a little warmth day and night.

All plants as they go out of bloom should be cut down, placing them where they can develop good growth. If plants are required for producing large blooms next season, cuttings must now be put in. I prefer putting one cutting in the centre of a small pot, the pots being then plunged in cocoa-fibre in a cold pit. If large specimens are required, some of the strongest of the single stemmed plants should be cut down, shaken out of the soil, and repotted into small pots, these will produce a number of fine shoots, which should be encouraged to grow, and if mildew should show itself dust them directly with flowers of sulphur; these plants will require very little water for some time to come; any varieties that may be wanted can be procured now.

THE STOVE.

Plants here will now be gay with flowers, such as *Eucharis* and early *Gardenias*; *Poinsettias* should now be at their best, these make a fine show of themselves when grown of different sizes, from 4 feet high plants in 24-size pots, down to 3 inch miniature plants in 60's. *Euphorbia jacquilloiflora* is another showy winter bloomer, good as a decorative plant, or for

cutting if grown near the light. The beautiful free-flowering yellow *Linum trigynum*, although properly a greenhouse plant, does better in a temperate-house in the winter. *Centropogon Lucyanus* will be found a very beautiful plant for various purposes during the winter months, and it produces its blooms very abundantly from the point of every shoot, and from the axils of almost every leaf. It is a charming plant for hanging baskets. *Thysanacanthus rutilans* should be put on shelves where their long drooping spikes will not get damaged. Great care must be exercised for some time in watering plants, not to allow any to suffer to the extent of shrivelling, and, on the other hand, not to give them enough to cause growth to ensue. Too much moisture in the air must also be avoided. Tubers of *Caladiums* which were induced to rest early in the autumn should be examined; and on no account placed near hot-water pipes, where they get dried up; there are far more bulbs killed annually by dry rot than by wet, and they are better left in their pots till the time comes for starting a few of them.

A good stock of peat should be got together; after picking it over and throwing out any sour coarse stuff or any pieces harbouring fungus, break it up, placing it in a dry airy shed, turning it over once or twice, so that by the time of the general potting it will be in good condition. Get a sufficient number of stakes painted, if this is done now the work in the busy season will be got over without hindrance. Sow again some *Panicum sulcatum*, also put in cuttings of *Panicum variegatum*, *Coleus*, and *Abutilon*; these will make nice plants for furnishing uses early in the spring. See that all plants are free from every trace of scale or bug. *A. Evans, Lythe Hill.*

TESTING SEEDS.

WHEN you want new seed Peas put one from the stock into your mouth and bite it. If it is very hard it is more than one year old. If the teeth enter it with moderate ease it is new seed. New Carrot seed always has a green shade on it. Old seed loses this, and is of a dead pale brown, and less fragrant. New Parsnip seed has a shade of green, which it loses if more than one year old. Onion seed is more difficult to prove than most other seeds, but if you take a single seed at a time and carefully bite it you will find that old seed has a tough dry skin, with a very white and harsh kernel, while new seed has a more tender, moist skin, and the kernel possesses a greater degree of moisture, and is somewhat oily. The seed may be cut with a peckoife instead of bitten. Onion seed that has no vitality at all has no kernel, or one perfectly dry. Test this by pressing the seed on a piece of white writing-paper. If it leaves no moisture on the paper it is of no use, and has been tampered with, or has lost its vitality by age. New Cabbage and Broccoli seed possesses a pale green shade in the kernel when pressed out or cut, and a tinge of green in the brown skin also. But old seed loses this in proportion to its age, becoming of a dull dark brown. Cabbage, Broccoli, Kales, &c., will retain their vitality longer than any other seeds, and will grow well when three years old, or even six years, if well kept. Beet seed has a faint tinge of pale green if new, but is a dull brown if old, and its vitality is very doubtful if old. New Celery seed has a faint tinge of green, and is very aromatic, but it loses the green and becomes less fragrant if more than a year old, and is doubtful. *American Horticulturist.*

TRADE NOTICES.

THE LAWSON SEED AND NURSERY COMPANY.

IN the First Division of the Court of Session, Edinburgh, on the 2nd inst., their Lordships heard counsel in connection with the petition by the Lawson Seed and Nursery Company, Edinburgh, to have the winding-up of the company carried on under the supervision of the Court. The petition was opposed by Messrs. Peter Lawson & Son, who stated in their answers that the company was perfectly solvent. Respondents also presented a petition asking that the resolutions to wind-up, adopted by the shareholders of the company, should, in the above circumstances, be recalled, winding-up being unnecessary. Their Lordships granted the supervision order asked by the

Lawson Company, and found them entitled to expenses.

NEW VEGETABLES.

The new Potato, *Mitled Beauty*, not yet in the market, and raised by Mr. Wiles, Edgemoor Park Gardens, has passed into the hands of H. Deverill, Royal Seed Stores, Banbury, for distribution. Mr. Deverill has also purchased the stock of the new Onion, *Ailsa Craig*, from Mr. David Murray, Culzean Castle Gardens.

SOURCES OF NITROGEN AS PLANT FOOD.

A CORRESPONDENT ("P. T. L.") in asking the following questions opens up a wide and an important enquiry.

1. Nitrate of ammonia being the chief compound from which the roots of plants absorb nitrogen, is the greater amount of it formed in the air (and carried to the earth by rain) or in the earth?
2. In reference to the nitrate of ammonia formed in the soil, how is its nitric acid formed, and how is its ammonia formed? Is its ammonia chiefly produced by the decay of organic substances, or absorbed from the air, or brought down by rain?
3. Do the roots of plants absorb ammonia combined with any other substances, but merely dissolved in water?
4. Do the roots of plants absorb sulphates, carbonates, and phosphates of ammonia in a state of Nature?
5. Is ammonia, uncombined with any other substances, brought down to the earth by rain?
6. In reference to the ammonia present in the soil, is the chief amount of it (a) brought down to the earth by rain, (b) absorbed from the air by the soil, or (c) produced by the decay of organic substances in the soil?

Plants obtain the elements of which they are built up partly from the atmosphere and partly from the soil. The water and most of the organic matter, making on an average from 92 to 95 per cent. of the total weight of the plant, comes from the atmosphere, either directly through the leaves or indirectly from the soil by rain, and then to the plant through its roots.

Nitrogen exists in soils in three combinations—with carbon, with hydrogen, and with oxygen. When in combination with carbon it is very insoluble in water, and it is in this form that we find by far the greater part of the nitrogen that exists in soils.

This nitrogenous organic matter of the soil has been derived either entirely from the decay of vegetable *debris* left in the land by preceding generations of plants, or possibly to some extent from past applications of farmyard or of other organic manures. It is also a fact that besides the residues of crops soils receive certain amounts of nitrogen from the atmosphere in the form of ammonia and nitric acid, but the quantity of these substances contributed annually by rain varies in different years and places. The average of many experiments on the Cootinot gives to 23 lb. of nitrogen per acre. The average of some English experiments is but 7.29 lb.

Rain also furnishes small quantities of alkaline chlorides, especially in the neighbourhood of the sea, and about 18 lb. per acre per annum of sulphuric acid.

Although the amount of ammonia directly absorbed by the soil from the atmosphere may in some soils be much larger than is shown by the analysis of the rain, yet the total nitrogen acquired, though most important as tending to counterbalance the losses of plant-food which the soil annually suffers, will have little effect on the present fertility in comparison with the large accumulation of nitrogenous matter resulting from previous crop residues, and decay of animal refuse.

In all kinds of soils there exist very minute underground organisms, called "bacteria," invisible to the eye, the function of which is to separate the carbon and hydrogen from the nitrogen, and to unite it with oxygen. But to effect this lime must be present in the soil, and the compound so formed is called nitrate of lime.

Nitrogen in combination with hydrogen forms ammonia, and the substance with which most gardeners are acquainted as ammonia-salts is obtained from an extinct vegetation.

Nitrogen in combination with oxygen forms nitric acid, these combine under the influence of the electric discharges in the atmosphere, nitrous acid being formed; this is converted into nitric acid by the

action of ozone, or peroxide of hydrogen, and is brought down by rain.

Ammonia cannot exist as such for any length of time in the soil, neither is it taken up by plants in that form.

The facility with which ammonia and other nitrogenous substances are converted into nitric acid by the oxygen of the soil is so great, that nitrates become by far the most important source of plant food.

The uncombined nitrogen of the atmosphere is not appropriated by plants.

Plant roots take up all the diffusible substances which are present in the water which they draw from the soil; but the feeding power of roots is by no means confined to the taking up of ready formed solutions, for they are also capable of attacking some of the solid ingredients of the soil which they render soluble and then appropriate, for the building up of their vegetable fabric. The best of all manurial applications are those which supply both phosphates and ammonia or nitrogen.

WEEKS' FIREPLACE BOILER.

This week we give two illustrations of Messrs. J. Weeks & Co.'s Fireplace Boiler, as exhibited at the Provincial Horticultural Meeting at Liverpool, where we had the opportunity of seeing it in action. The open fire serves to warm the room and to heat the water in what is in reality a tubular boiler capable of warming a small conservatory, or hall and staircase at the same time, and by means of the same fire. It will be seen on reference to fig. 154 that the Fireplace Boiler presents the same appearance as an ordinary register stove, but the back, sides, and bottom are formed of water bars and chambers, and, in fact, constitute the boiler. When the fire is banked up for the night the stove is shut up by means of doors, as shown in fig. 155. This transforms it into a slow combustion furnace, and thus closed it will keep alight for very many hours without attention. The small hit-and-miss ventilators shown at the bottom of the doors are for regulating the supply of air to the fire—only just enough to support combustion being admitted. The fuel used is anthracite coal, and the economy of the arrangement is very great.

This boiler will be found very valuable for warming small conservatories attached to dwelling-houses or for warming the hall or staircase of a house, or a room which has no fireplace, or, in short, for any small apparatus where there is no provision for a stovehole and flue, as required by an ordinary hot-water boiler, and where they could not be constructed without disfiguring the house and its surroundings. In such a case, one of these Fireplace Boilers might be placed in the existing fireplace of any adjacent room and connected to coils of pipes in the apartments required to be warmed, and thus accomplish the desired end. Another advantage possessed by this boiler is, that it can be managed by a house servant in the same way as an ordinary fire; while, on the other hand, experience has shown that servants cannot or will not take the trouble to manage the usual forms of hot-water furnace, which, it must be admitted, is anything but a cleanly operation.

WOODS IN THE LATE COLONIAL EXHIBITION.

(Continued from p. 766.)

QUEENSLAND COURT.—Few persons if at all interested in the timber produce of the Colonies can have failed to notice the two gigantic logs of the Red Cedar or Toon tree (*Cedrela Toona*), exhibited by Mr. Burgess from trees grown on the Blackall range of hills. The largest of these was nearly 13 feet long and 20 feet 5 inches in girth; the smaller 12½ feet long and 18 feet 8 inches in circumference. Usually in trees of such gigantic proportions the stems are unequal, furrowed, and fluted, but not so in the specimens under consideration, for I was not a little surprised, although I must confess agreeably so, to find after a careful examination that they were remarkably uniform, and with but little taper; while the bark was soft to the touch, not flaked to any great extent, and put me much in mind of that of a twenty years' old *Welligtonia*. A good idea of the quality and capabilities of the timber could be gleaned from the sensible way in which one at least of the logs was prepared, a portion of that at about 4 feet from the ground being neatly cut out in

triangular fashion, the faces thus made being planed and polished, thus showing well how the wood worked under the tools of the carpenter, as also the peculiarities of graining and susceptibility of being polished; while both above and below the timber in its natural condition was plainly visible. We, in this country, have had ample opportunities afforded us of examining the Cedar wood, as most of the boxes in which the Bengal and Assam Teas are sent over to this country are manufactured from it; while logs and boards are not unfrequently imported under the name of Moulmein Cedar. It is of a red or brownish colour, beautifully marked and grained, easy to work, and being very lasting or durable when converted, is much in use by the Queensland carvers and cabinet-makers. It is not hardy in this country, although a nearly allied species we noticed in fine form at the Royal Gardens, Kew.

Araucaria Cunninghamii, a tree that has more than once been tested as to suitability for planting in this country, but invariably found wanting, produces a pretty wood, light yellow in appearance, and which is strongly recommended for furniture making and

akin to that of the Cypress Pine. There was exhibited of this tree a cross section of a pile that had been exposed to the action of the waves of the Pacific Ocean for eleven years, thus showing how well it is adapted for resisting the ravages of the sea worms that are so destructive to nearly all other known woods. Another useful quality of the Turpentine tree, which we may notice in passing, is in its being almost fire-proof, for it will only char or consume slowly away. For railway sleepers and boarding for rooms it is much sought after.

Another Conifer, *Podocarpus elata*, or She Pine, is likewise, useful for maritime positions, as it is fairly proof against the teredo attacks. For spars, masts, and many other uses in connection with navigation, the wood of the She Pine is highly valuable, it being long and close grained, not at all brittle, and very durable. From the specimens of the wood exhibited, including a plank, veneer, and book block, we could not but compare it, so far at least as colour was concerned, with that of the *Araucaria imbricata* produced in this country, it being of a very pleasing rich yellow tint.

FIG. 154.—WEEKS' FIREPLACE BOILER.

boarding, it being, although very firm and close in texture, easily worked, and susceptible of being polished or stained at will.

A *Bidwillii*, the Bunya Pine, for timber purposes, is quite equal, if not, indeed, superior to the last, as may be seen from the plank, veneer, and book-block exhibited, all of which show off to perfection the light coloured but beautifully marked appearance of the wood, and adaptability for the uses of the cabinet-maker and joiner. The cones, two of which were exhibited, we were delighted to see, and we were certainly not disappointed for their large size, and 2 inches long edible seeds were quite up to published descriptions.

Of the Cypress Pine (*Callitris robusta*) we took particular notice of a beautiful plank, some 14 feet long, and 18 inches wide, and nearly half a foot thick, and which revealed in a marked degree the buff-brown coloured wood with its pinky longitudinal streaks. It is very pretty, slightly fragrant, and owing to its resisting the attacks of the teredo or seaworm (*Teredo navalis*) better than any other native wood is largely used for wharf piles, sheathing of boats, or any other work in which it is exposed to the sea-water. The New South Wales Turpentine tree has similar qualities that recommend it for purposes

Of the Eucalyptus or Gum trees the wood of about forty species was exhibited, all of which are of great value in the arts, as was clearly shown by the number of useful purposes to which they are applied; indeed, in scanning over this fine collection one could not but feel astonished that the timber of a single genus is capable of being converted into such a multitude of diverse uses, for whether we take cabinet-making, house-building, fencing, ship-building, railway sleepers, piles, or a score of other minor matters, the wood of one or the other species of Eucalyptus is highly valued; while the bark contains a valuable tannin matter, and is, further, of great use in the manufacture of ropes and cordage.

A large plank of the Bloodwood (*E. corymbosa*), 15 feet long, 22 inches wide, and 7 inches thick, shows off well the deep rich reddish colour of the wood of this useful tree, and forcibly impressed upon us how well adapted so large and durable a wood must be for the varied uses to which it is applied not only in Queensland but throughout Australia generally. For piles, posts, railway purposes generally, but particularly for use underground, the wood of this Eucalyptus is highly valued, the large deposits of gum which occur here and there in the timber rendering it very lasting even under the most trying circumstances.

This gum contains, so we were told, fully 43½ per cent. of tannin.

Nearly approaching the latter wood, both in colour and texture, is that of the Blue Gum (*E. tereticornis*), a common Queensland tree, and one that is highly prized by the colonists, not only for its ornamental appearance, but the valuable timber it produces. The wood is of a dull red colour, tough, durable, and close-grained, and used extensively by the builder, cabinet-maker, and railway companies. For veneering purposes it would seem, from one of the specimens exhibited, to be well adapted, while a book block, into which it has also been formed for exhibition purposes, shows the pretty blue bark, and from which the name of Blue Gum has been bestowed upon the tree. The timber of two other species, *E. siderophloia*, the Ironbark, and *E. microcorys*, the Turpentine or Peppermint tree, pleased us much, for the beautiful colour and close graining betoken uses many and varied. For the purposes of the wheelwright the timber of the latter tree is perhaps of greater value than any other native wood, it being remarkably tough, long-grained, and durable.

situations at Penrhyn Castle, but always with the result that it is cut over during severe winter, even when it has attained to a large size. Messrs. Veitch inform me that *E. coccifera* has stood unprotected in their Coombe Wood Nursery for several years, and during intense frost; and certainly judging from a number of trees pointed out to me, the tree in question seems well adapted for withstanding our somewhat fickle climate. Experiments are being instituted on several estates—maritime and inland, high-lying and but little above sea level—and should these warrant the extensive planting of so valuable a tree, it will certainly be a great acquisition to the British arboriculturist, to be able to produce a timber of such excellent quality, and that is so well suited for general purposes as that under consideration. *A. D. Webster.*

AMERICAN FRUIT CULTURE.

THE following remarks are taken from a recently delivered address of President Earle to the American Horticultural Society, in Cleveland, Ohio:—
“Perhaps no industrial expansion of the time shows

Thirty or forty years ago it would be safe to say that all the Strawberries marketed in one day in the United States could have been gathered by a force no larger than I have seen bending over the smiling rows of a single plantation. Now there are probably not less than a quarter of a million harvesters engaged in gathering this delightful fruit for market growers. Then the season of this fruit was limited to the three or four weeks of its ripening in each locality; now by the help of railways and refrigerator transportation it extends over four or five months of the spring and summer, and Strawberries are sometimes transported a distance equal to that from the Atlantic to the Pacific seas.”

HOME CORRESPONDENCE.

The Winter Spinach Crop.—There was a notice of the general failure of this crop in a recent issue of the *Gardeners' Chronicle*, which was commonly attributed to too high manure before sowing. As I have to produce a supply of this vegetable all the year round I would remark on the culture of Spinach, giving a sketch of the practice I have for many years carried out with success. I always use ground for this purpose that has been well manured, and which has been used for the crop of second early Peas. After this last crop has been cleared off the ground is deeply dug, raked down, and rolled, drilled, and sown the second week in August. When the plants are up, and large enough to handle, they are thinned out with a hoe, so that those that are left stand about 6 inches apart; and before sharp frosts set in the land is mulched with short manure. When treated in this way Spinach stands the frost very well, producing a good supply of succulent leaves till the spring-sown crop is fit for use. But this season the plants made such rapid and early growth, which has only been checked by the recent severe frosts, that about a third of the crop has run to seed; but as I generally sow a large breadth we shall not feel the loss materially. I never experienced any loss of crop before, and can only attribute it to the too rapid growth made in the early autumn months. I usually sow the round Spinach in the second week in February, and fortnightly afterwards up to the time of sowing the winter prickly-seeded Spinach, and so ensure a continuous supply throughout the year. *Edward Ward, Havell, Bramsgrove.* [If our correspondent would sow his Spinach at fortnightly intervals up to the middle of September, but little loss will be caused by plants bolting. Ed.]

— Monstreuse de Carentan is a fat-leaved robust kind not running to seed readily. The leaves are very large and of much substance; owing to this the plants must stand at least a foot apart in the row with a 2-foot space between the lines. It is hardy enough for the winter crop. *N.*

Dwarf Scabious for Winter Work.—A large number of plants of the dwarf German Scabious is in flower at Gunnersbury Park just now; and Mr. Roberts, who grows them most successfully, has been cutting freely during the last six weeks. There are many colours, from white to rich deep maroon; and though seed may be saved from two or three select varieties, the seedlings will show many forms. The seed is sown in the middle of May, and the plants are put eventually into 32-sized pots, grown outside all the summer, and then stood under the glass-covered Peach-wall, or in a frame, where a little heat can be given to keep the flowers expanding, and to keep down damp. *R. D.*

Tobacco Culture.—The article published in your issue of Oct. 30 on “Tobacco Culture in Jersey” contains so much that accords with my own experience that I cannot refrain from supporting it by a few remarks. I am one of those who twenty years ago grew Tobacco, ripened and cured it in an English garden. The result was a Tobacco of fair quality but deficient in the aroma so necessary to produce a first-class cigar. From my experience of the climate of the hills and plains of Jamaica, I long ago assumed that first-class cigar Tobacco can be grown only in a purely tropical climate, and subsequent experience confirms this view. We have here—in the hills—a climate giving a mean annual temperature of 63° Fahr., while on the plains the corresponding temperature of 79° Fahr. is found to prevail. All the Cuban refugees in selecting their sites for Tobacco cultivation choose low alluvial at elevations from 50 to 300 feet above sea, and no attempt has been made to produce an article in the hills. Wishing to test the matter I have proved that Tobacco grown in the hills at the above-named temperature is deficient in aroma and not so fine in quality and texture of leaf as that grown at lower elevations. Tobacco of good quality can, without doubt, be

FIG. 155.—WEEKS' FIREPLACE BOILER. (SEE P. 788.)

Dr. Howitz, of Copenhagen, in a lecture delivered at the International Forestry Exhibition, spoke as follows regarding the *Eucalypti*:—Though the *Eucalypti* are suited only for cultivation in hot or warm climates, and though probably their cultivation did not interest the people of the British Isles, he maintained these trees ought to be of some importance to this country on account of the great value of their timber, which, if utilised for certain purposes, would drive the timber from our own woods out of the market. The Jarra wood (*E. marginata*), for instance, would supersede all others for piles for wharves, and a certain class of shipbuilding, while the Red Gum (*E. rostrata*) and its congeners would be placed foremost as railway sleepers, wood pavements, &c. Where hardness, durability, and resistance to the attacks of insects were required, these trees were preferable, and it was certain that they had a great future before them. He believed likewise that the large quantities of our native trees, which had hitherto been used for such purposes, would be forced into other branches of industry if the use of *Eucalyptus* became general.

That such a useful tree as the *Eucalyptus* is so suited for growth in this country is certainly to be regretted. *E. globulus* has been tried in various

more remarkable results than the business of American fruit culture. A single generation has witnessed a revolution in the habits of living of the American people. The rare luxuries of thirty years ago have become the everyday necessities of American tables, and the health-giving and refining influences of general and abundant fruit supplies are working their noticeable effect upon the physique and character of the nation.

“Thirty years ago the daily receipts of Strawberries in the city of Chicago—now the second greatest fruit market in the world—could all have been carried in one wagon at one load, and it would not have been a large load either. Now whole railway trains are engaged to carry the daily supply of that market, which often amounts to 300 tons, and sometimes to twice that quantity! A similar increase of supply has taken place in most of the markets of the country. The production of the Wilson Strawberry was the beginning of a new era in Strawberry culture, and I may add of small fruit gardening; for all branches of the business have been stimulated and carried along by the tide of enthusiasm which has planted Strawberry fields all over the continent, and covered the tables of the rich and of the poor alike with their dishes of fragrance and crimson beauty.

grown at lower temperature, but it is doubtful whether it can ever be produced of such quality as to compete with a fine-flavoured Havana or Jamaica cigar. With inferior Tobaccos in Jamaica there is used for flavouring purposes a preparation made from the seeds of *Dipterix odorata* (Tonquin Bean), which certainly improves them; but with fine and well-cultured tropical-grown leaf there is no necessity to use anything of the kind, as it possesses sufficient natural aroma. The process adopted by the gentlemen who are interested in growing Tobacco in England (as described in your columns) for curing the leaf are, though right in theory, wanting in one essential particular, and that is, temperature. If they could arrange to give a temperature of 85° or 90° Fahr. to their curing-houses, and regulate the degree of humidity by the hygrometer, so that the wet and dry bulb differs but by one or two degrees, I believe they would attain much greater success. *W. H. Hart, Botanical Department, Jamaica.*

Auricula Shows.—I saw announced the meeting for the purpose of fixing the dates of the Southern shows. As this seems to be the usual time for such fixtures being made I would like, with your consent, to bring a suggestion before your Scottish readers. There are a considerable number of Auricula growers north of the Tweed, and I think, if the matter be properly taken in view, creditable shows might be got up. I would suggest Edinburgh as the best centre for holding it, and Wednesday and Thursday, May 11 and 12, as the best dates. I give these dates from my notes of several years as being nearest to the season of full bloom. I will undertake to send from thirty to fifty plants—not necessarily for competition. *Wm. Stratton, Ainsfield, Broughty Ferry, Dec. 9.*

Eucharis amazonica at Gunnersbury House.—Some remarkably fine specimens of this plant are to be seen at Gunnersbury Park, which do great credit to Mr. Roberts' skill in growing them. There are about a dozen plants in No. 2 pots, and they have not been repotted for two years, but are fed with soot-water and liquid manure. The plants are from 5 to 6 feet through, measuring from the leaf points, and they flower with remarkable freedom, but as flowers are in large demand from Gunnersbury, they are soon cut. The specimens are grown in the same temperature as the East Indian Orchids. Mr. Roberts states that if there is any secret in growing creditable shows, it might be to note that as a very young leaf puts in appearance, that may be taken as an indication that a flower-stem will follow. The plants are dried off for a time, and then the flowers come up abundantly. He also states that the *Eucharis* should not be grown to too high a temperature. *R. D.*

Adiantum Farleyense.—Mr. Shuttleworth's letter appears to prove that Farleyense is sometimes fertile. When I was at the Royal Exotic Nursery twenty years ago they had one plant of that variety standing in what was then the Veranda-house, and I remember the Fern grower, Mr. Southcombe, told me that he had sown spores of it, and instead of getting Farleyense there came up *A. scutum*, of which variety he considered it a sport. So I suppose that plant must have produced spores, or at any rate spore cases, yet for the last fourteen years I have always had one or more plants under my care, during which time I must have had hundreds of fronds, some of which I had become shabby of the plants, and quantities of others that had become useful for decorative purposes, and yet I have never seen a single spore case. I have five plants at the present time, four in pots of different sizes, and one in a basket. I have examined them all carefully to-day, and cannot find anything that could mistake for a spore-case. I may say I find Farleyense a peculiar subject. I have always managed to have one good specimen, but very often in the same house, under exactly the same treatment and attention, there would be three or four plants that were anything but good-looking. They seem to dwindle away, each new frond being smaller than its predecessor, until a plant that had broods 2 feet long last year would be making miserable effort to produce fronds not 2 inches long. I have tried all kinds of growing material, hoping to restore the invalids to health and vigour. Occasionally I have succeeded, but more often the plant became less and less, until there was nothing but the soil left to throw on the rubbish heap. And I am still at a loss to account for their slow decay. *G. Pate.*

—The appearance of what are supposed to be seedlings of *Adiantum Farleyense* in places where, according to the evidence adduced, no plants with fertile fronds were known to exist, is certainly somewhat remarkable. Now, here this occurred with almost any other Fern, it would not be difficult to suggest some means by which spores might have been transmitted; but as *A. Farleyense* rarely, if ever, produces spores, I am inclined to think that the plants found were not seedlings at all; it seems more probable that they originated from small portions of the old plants. Like many other plants which

do not produce seed (or spores) freely, *A. Farleyense* can be readily increased by other means. It produces numerous small, rather short rhizomes, the points of which, if broken off, and placed in congenial quarters, will start into growth; and at first sight may easily be taken for seedlings. In dividing, or re-potting plants, some small portions, may get among soil which will afterwards be used for potting other plants, and so spring up as if from other spores. In removing the rhizoms from plants, small pieces of the rhizome will, perhaps, get broken off, and if they happen to fall where there is sufficient moisture and they remain undisturbed, they may start into life. I may add that I have found plants growing under the conditions suggested. I herewith send a small plant, and portion of rhizome showing what tiny pieces will produce plants. *A. Hemley.*

—The first time I had any indication of this Fern fruiting was from a frond or part of one given me to name. It was almost, if not quite identical with *A. Farleyense*, but from the presence of fructification, which I had never seen previously on the latter, I considered it as another form of *A. tenerum*, of which *A. Farleyense* itself is reckoned to be a form by some good authorities. On recent examination of a large plant, however, imperfect fructification seems to be by no means uncommon. The tips of margins of the lobes are reversed in the ordinary manner, although somewhat loose, in order to cover the spore-cases. Examination of the latter, under the microscope, shows the annulus and other structures to be distinctly and fairly well formed, and although the cases contained no spores it is quite possible that one out of a hundred would contain good spores. I have always considered *A. Farleyense* to be a form in which the vegetative tendency had gained the upper hand or mastery more or less completely over the fruiting tendency. In other words, we see that barren fronds are always broader than fertile ones. Because generally barren I fail to see why it should be considered a hybrid. *A. Basei*, generally considered of hybrid origin, bears spores abundantly. Nor have I ever heard it suggested that *Polypodium vulgare canaliculatum* is hybrid although perfectly barren. The variety *P. v. semilibrum* has the lower half of its frond broad, twice divided or cut, and barren, while the upper half is once divided and fertile. *Scopolopodium vulgare crispum* shows the same excessive luxuriance of vegetative growth, causing the frond to be strongly undulated and perfectly barren. Other cases are to be found amongst Ferns much given to sport or vary in the above-mentioned manner. *F. F.*

Plants which Flowered late in November, 1886, in Yorkshire.—The following is an unusual list of plants in flower in the west of Yorkshire at the end of November, and may be thought worth noting:—

At-temera, crimson and green variety.	* <i>Eche macarpus eryngium</i> sp.
<i>Anemone japonica</i> .	<i>Gadella</i> sp.
<i>Aspidistra</i> .	<i>Hebe</i> sp.
<i>A. sp.</i> , with bright red stars.	<i>Helibryum bracteanum</i>
<i>Aspidistra japonicum</i> .	<i>Heliopsis</i>
<i>A. sp.</i> , with white flowers.	<i>Hydrangea paniculata</i>
<i>Alyssum maritimum</i> .	<i>Impatiens anallurata</i>
<i>Antirrhinum majus</i> var.	<i>Kniphofia</i> sp.
<i>B. f. Dorsum</i> .	<i>Loxia latifolia</i>
<i>Clematis vitalba</i> .	<i>Loxia</i> (in annuals) and var.
<i>Campanula gongolona</i> .	<i>Papaver canaliculatum</i>
<i>Caryophyllus a. nense</i> .	<i>Phlox Drummondii</i>
<i>Clematis Jackmanii</i> .	<i>Præloxium uliginosum</i> and others.
— white.	Reseda.
<i>Clethra alifolia</i> .	<i>Rose</i> Cheesman Hybrid.
<i>Crocus</i> (in pots).	— Duke of Edinburgh.
<i>Crocus speciosus</i> .	— Eugene Furest.
<i>Cyclamen heteranthemum</i> .	— Claire de Pison.
<i>Dahlia</i> , stamined, but not killed; 2½ flowerings on the 25th.	<i>Schizostylis coccinea</i> .
	* <i>Scopolopodium majus</i> .
	<i>Spirea</i> , dwarf pink var.

R. Milne-Rodwell, Hobden Clough, Clitheroe.

Eleoedendron orientale. Jacq. (*Aralia Chabrieri* of gardens).—On submitting a branch of what is known generally as *Aralia Chabrieri* to Professor Oliver, for identification, he at once said it was not an *Aralia* at all but a member of the *Celastrus* order, and on looking to the herbarium he found specimens of *Eleoedendron orientale*, which agreed exactly with this so-called *Aralia*. Curiously enough I saw in the Botanic Garden at Rotterdam the other day a plant called *Eleoarpus angustifolius*, which I noted as "probably a mis-named form of *Aralia Chabrieri*." No doubt the name *Eleoarpus* has been altered from *Eleoedendron* by mistake, and there is in Steudel the name *Kulenia angustifolia* under *Eleoedendron orientale*. This plant is apparently as varied in leaf-characters at different stages of its development as the *Aralias* are, the foliage of young plants of the *Eleoedendron* being long, linear, and dark green, that of older plants shorter and broader, whilst in mature specimens the leaves are "very thin, coriaceous, obtuse, crenate, 2 to 3 inches long, and cuneate at the base." In Jacquin's *Zones* there is a figure of the juvenile form by the side of one of the mature leaves, and the

* Against house wall, not damaged, and in full bloom.

former is exactly what we have as *Aralia Chabrieri*. Although introduced as a new plant it appears that this so-called *Aralia* is one of our oldest garden plants, having been cultivated in England in 1774, and it was at Kew in 1811 (*Florus Kewensis*). It forms a shrub or tree of from 10 to 30 feet in height, and bears very small axillary green flowers, which are succeeded by Olive-like berries. It is a native of Mauritius, also of the island of Ruritopia, where it is perhaps the commonest tree (B. flour), Bourbon and Madagascar. Another species, *E. castane*, is figured in the *Botanical Magazine*, t. 3835, and this also is described as having leaves of variable character. *W. Watson, Kew.*

Plants for Bees.—Supplementary to what has been said in the *Gardeners' Chronicle* at p. 756, in reference to honey-producing flowers, my best plant in very early spring, when the "workers" want some early natural food after a severe winter, is the Moorish Heath (*Erica carnea*). About Mallock, in Derbyshire, it can be procured in quantity, and it may be seen in any soil without the aid of peat. If any money serves no right, a good supply may be either Watered or Noble. But for natural food for bees it is not its equal; the plants always bloom early in January, and if there is a mild day in February the workers will be seen luxuriating from flower to flower. Other food plants are *Daphne Mezereum* and the red and white varieties of *Ribes*, flowering Currants. These also bloom with us here in the south of Ireland in February. For seeds let me add *Melilotus officinalis* and *M. nemorosus*. The seeds of this latter have a perfume as of new mown hay, reminding one forcibly of the odour of honey as *natural* gathered in meadows by children after the mowers in days of yore. *Cerinth* *gymnandra* (*Linneywort*), *C. aspera*, *Lillemantia canescens*, *Placelia congesta* and *P. tanacetifolia*, *Cynoglossum scaberrimum*. Then we have Sweet Alyssum and Sweet Scabious, Balm, Hyssop, Sweet Basil, and for a rich feed in autumn, *Sedum* is a respectable, that a beautiful object on a warm morning in September is a bed of this *Sedum* grown on poor rubbly soil, all the colours of the kaleidoscope in bees and butterflies basking on a rich carpet of plush! A good subject for an artist, and if the butterflies could be all guaranteed white, for an instantaneous photograph. *Contingens.*

—In the list of flowers for bees given in your issue of Saturday last (p. 756), there is no mention made of *Impatiens glandulifera* (the Giant Balsam), which we consider is one of the best "bee plants" grown. In your journal for February 10, 1883, it is thus referred to:—"Of its honey-yielding properties, and that our bees are immensely fond of it, there cannot be any doubt whatever, judging by the number of bees which frequent it when in flower." The plant is of handsome appearance, shrubby in habit, attains a height of 4 to 5 feet, and is so hardy and free growing that it will do almost anywhere. Since we have recommended it as the best in our collection of flowers, it has been much in request by our bee-keeping customers, and is found to answer admirably. While upon this subject, we may also say that we have often observed how fond bees are of the Irish Heath—more so of it, apparently, than of other Heaths. Examining a well-bloomed twig of it, we found that the bees, in order to get at the nectary, had perforated the waxes at their base, and by this means reached the treasure. *R. Welch Esq. Sot.*

Eucalyptus amygdalifolia.—At p. 712, in Dr. D. Landsborough's interesting and instructive article upon Australian and New Zealand trees and shrubs on the island of Arran, mention is made of the above species of *Eucalyptus* as flowering for the first time in Britain in the open air. At this place it has flowered for many years; it has also matured seeds, from which I have raised one tree. Since it is from 6 to 6 feet in circumference at 3 feet from the ground, and about 60 feet high, and would have been much higher but is kept down by high west winds from the Atlantic. Perhaps it has never flowered more profusely than it has this summer; the nearest branches to the ground being over 20 feet, the attention was first attracted by the hum of thousands of bees on its flowers. *W. O. Fota Island, Cork.*

Trimming Hedges.—In relation to the question raised by "Diss," p. 757, I should like to mention the well-known fact, that railway hedges are amongst the best and nearest of the kind in the kingdom, and yet these are generally "switched" during the summer, whilst the summer growth is yet tender; and yet it cannot be denied that the White Thorn, of which these hedges are mainly composed, and which forms the chief hedge plant of the kingdom, seems to like this summer pruning. I have had portions of one of my White Thorn hedges, probably some fifty or sixty years planted (for they are 7 feet in height, and thick), and these have for many years been "switched" in the month of June; indeed, it seems doubtful whether the severe hacking which is useful after the summer growth has become hardened is not far more harmful

members of committee for the ensuing year. A brief discussion took place as to the mode of conducting the election, and the Rev. H. D'Ombraïn then read the annual report, which is as follows:—Presenting this report the committee wish to remind their members that the Society has now completed its first decade; and in looking back upon the hopes expressed at its foundation they cannot but feel that those anticipations have been in many respects more than fully realised. The Society has from the very first enjoyed the confidence of the Rose growing community generally, and has managed to effect a considerable increase in the management of local Rose societies, and their methods of exhibition, besides bringing about the almost entire discontinuance of two days' Rose shows. Indeed, its influence in these respects has even extended to other special societies in this country, as well as to some of those recently started on the Continent and in our colonies. It has also, besides leading to the wider cultivation and exhibition of showy Roses, helped much to encourage the growth of those garden varieties which find great favour with many horticulturists at the present time.

"The past year has in no way come short of its predecessors in the success which has attended the Society's operations. Its two exhibitions, the metropolitan show, at South Kensington, and the provincial show, at Birmingham, have, as usual, brought together very fine collections of Roses, as well as a large number of visitors who were interested in the culture of our national flower. The exhibition at Birmingham was particularly interesting, as it was new ground for the Society, and the fixture being well timed in the season, there was an unusually large display of fine flowers. That at South Kensington was one of the most extensive the Society has yet held, but owing to the hot dry weather which prevailed on the exhibition day and for some time previous to it, the individual blooms were not, as a rule, so large as are usual in our country. The medals which have been much appreciated, and are on all hands admitted to be greatly superior in design and execution to those previously issued.

"With regard to finance the committee are unable to report so large a balance as last year. This, however, will be found to be almost entirely due to the large expenditure on the dies for the new medals, and to the additional prizes awarded this year at both the metropolitan and provincial exhibitions. The total receipts have amounted to £590 14s. 7d., and the expenditure to £583 15s. 7d., leaving a balance for the financial year of £56 19s.

"In making arrangements for 1887, the committee hope to hold their metropolitan exhibition as usual at South Kensington, where the superintendent of the Royal Horticultural Society's gardens, Mr. Barron, hopes so to arrange the staging and conservatory that the flowers will be displayed to better advantage, and at the same time be more convenient for both exhibitors and visitors. In order to carry out the original intention of the Society as a national one the committee have entered into arrangements with the Royal Caledonian Horticultural Society for the provincial show to be held in Edinburgh on July 13. The Lord Provost of Edinburgh has kindly consented to take an interest in this exhibition, and every endeavour will be made to render this the first show the Society has held out of England, in all respects a successful one.

"The privileges of members are the same as in former years, subscribers of £1 being entitled to two private view tickets, and also to four transferable tickets, admitting at the same time as the general public. Members subscribing 10s. are entitled to one private view ticket, and also to two transferable tickets. Each one of these tickets will be available at either of the Society's exhibitions. Members who are subscribing for the first time in 1887 will receive a copy of the Society's illustrated catalogue of exhibition and garden Roses.

"It is again the pleasing duty of the committee to express their best thanks to those kind friends who have undertaken in different parts of the country to act as the Society's local secretaries; for it is unquestionably in a great measure through their exertions that the number of members has been so well maintained.

"The Chairman, in moving the adoption of the report and financial statement, congratulated the members on the success which had attended the work of the Society, and considered that they had good cause for satisfaction with the results. He also thought it a good opportunity for suggesting that local secretaries and those interested in the Society should use their influence to maintain it in the high position it now so worthily occupies.

"In the course of the discussion which followed the Rev. H. D'Ombraïn said that, should any difficulty arise as to holding the metropolitan exhibition, which is fixed for July 5, at South Kensington, as in previous years, arrangements could probably be made for its being held at "Olympia," near Addison Road Station, Kensington, which is well adapted

for the purpose. With reference to the provincial exhibition to be held at Edinburgh, July 13, he had no reason for believing it would prove a great success. The Lord Provost had promised his influence, and a considerable sum had been already received by the Council of the Royal Caledonian Horticultural Society towards the special prize fund. Referring to the provincial exhibition for 1888, Mr. D'Ombraïn said that an application had been received from Darlington to hold the show in that town; and he thought as the previous exhibition held at Darlington had been so successful, it would probably be to the advantage of the Society to take the application into consideration.

Rev. Alan Cheales, in seconding the motion for the adoption of the report and balance-sheet, said that with a number-roll of 425 societies in affiliation, they had no cause to fear as to the future of the National Rose Society. On being put to the meeting, the motion was carried unanimously.

As the result of the ballot, which was declared at this stage, the following are the officers for the ensuing year:—President, the Rev. Canon Hole; Vice-Presidents, the Hon. and Rev. J. T. Boscawell, the Rev. J. M. Fuller, Robert Hogg, LL.D., James McIntosh, and the Lord Provost of Edinburgh; Hon. Treasurer, Thomas Burt Haywood; Hon. Secretaries, the Rev. H. Honeywood D'Ombraïn and Edward Mawley; General Committee, H. Appleby, Rev. H. A. Berners, Rev. H. B. Bign, R. Bostman, G. B. Burdett, J. C. Cant, Rev. A. B. Cates, Captain Christy, E. Claxton, J. Cranston, Rev. A. Foster-Melliar, Rev. F. Gall, T. W. Girdlestone, W. J. Grant, T. B. Hall, G. P. Hawtry, J. Shirley Hibberd, C. F. Hore, W. J. Jefferies, E. B. Lindsell, Dr. M. T. Masters, F. R. S., Rev. F. Page-Roberts, G. Paul, F. C. Pawle, J. D. Pawle, Rev. J. H. Pemberton, G. W. Piper, G. Prince, W. Bunssey, J. Sargent, A. Staughton, A. Troughton, R. E. West, E. R. Whitwell, J. Wilkies, Rev. W. Wilks, and W. H. Williams; Hon. Auditors, J. D. Pawle, and F. T. Wollaston.

A discussion arose, in which the Rev. H. D'Ombraïn, Mr. T. B. Hall, Rev. J. H. Pemberton, Mr. G. Paul, Mr. B. Cant, and other members took part, as to the advisability of continuing to offer the challenge trophies at the metropolitan exhibition as at present, or of offering them alternately in London and the provinces. As the result of the discussion, the committee was instructed to consider the question and report to the next annual meeting. Mr. G. Paul suggested that the exhibition at which the trophies were offered should be the principal one of the year—a suggestion which met with general approval.

Mr. B. Cant referred to the question as to the best stocks for Roses, and quoted from a letter in which the Rev. H. D'Ombraïn had had Roses on the Manetti which were at least twenty years old, and the most vigorous state of health.

Votes of thanks were accorded to the Horticultural Club for the use of its rooms, to the officers for their services, and to the Chairman.

The annual dinner was held in the evening, under the presidency of the Hon. and Rev. J. T. Boscawell. The majority of the members, whose names are given above, were present, and a very enjoyable evening was spent, the toasts being few and the speeches brief.

NATIONAL CHRYSANTHEMUM.

A CHRYSANTHEMUM "ALBUM."—As briefly announced last week at p. 754, Mr. C. Harman Payne exhibited at the meeting of the National Chrysanthemum Society's Floral Committee, held in the Royal Aquarium, Westminster, on the 6th inst., an Album which he had compiled, comprising the earliest known drawings of this flower down to the present time, showing its gradual development. We now think it will be of interest to our readers to learn the following facts:—It appears that the earliest drawing, which is dated 1789, illustrates the first large flowering Chinese Chrysanthemum imported into Europe by Miss Beauchamp; the next is dated 1802, and is an illustration of the Changeable White, the first sport fixed in England, and it occurred at the Bishop of London's garden, Fulham Palace. Then follow illustrations of importations from China between 1802 and 1820. Plate No. 53 represents Sanguinea and Expanded Crimson, two of the first English seedings, raised by Mr. Isaac Wheeler, of Oxford, who began this work in 1832; and No. 55, seedlings, raised by Mr. Freestone, of Dowham, Norfolk, who followed Wheeler in 1835. Plate 63 is Chrysanthemum indicum, copied from the specimen in the Herbarium of Linnaeus; and plate 65 one of the same copied from a drawing in the possession of the old East India Company in 1823. Then follow drawings of varieties raised between 1850 and up to the present time. Plate 191 is worthy of special notice as representing six varieties, three incurred and three Japanese, and it is said to be the only coloured picture of the flower that has been produced in America. This

statement is made on the authority of Mr. John Thorpe, formerly of Stratford-on-Avon. The Silver Medal of the Society was unanimously awarded to Mr. Payne for this interesting exhibit. Mr. Payne is also making a collection of the literature of the Chrysanthemum, and has got together much of this character, but has not yet succeeded in bringing it to that state of completeness he hopes to reach in a short time. He would be glad of any reference to old pamphlets on the culture of the Chrysanthemum issued previous to 1840.

PRESENTATION TO MR. WILLIAM HOLMES.

The annual dinner of the Society took place at the old "Four Swans" Tavern, Bishopgate Street, E. C., on Monday evening last, the President, E. Souderton, Esq., in the chair, and some 112 members and friends being present. After the toasts, the prizes awarded at the Royal Aquarium show in November were presented, together with some special medals, among them one to Mr. C. Harman Payne, for his Chrysanthemum Album, on behalf of the subscribers to the same. Mr. E. C. Jukes presented to Mr. C. Gibbon, of Morden Park, a handsome silver cup, in appreciation of the remarkably fine stand of forty-eight blooms of incurred Chrysanthemums shown by him at the last Aquarium exhibition, but unfortunately disqualified owing to an oversight in putting up four blooms of one variety.

Mr. Sanderson proceeded to present to Mr. William Holmes, the Hon. Secretary of the Society, a tastefully illuminated address in a massive gilt frame; and three handsome epigrams, subscribed for by members of the Society. The address sets forth the regard and esteem entertained for Mr. Holmes by the members of the Society; and their sense of the inestimable value of his services to it, and especially in the direction of extending the culture of the Chrysanthemum. The centre epigram (this and the two side pieces being in silver and composed of twin Palms, with their leaves supporting receptacles for flowers and fruit) bears the following inscription:—"Presented to Mr. W. Holmes, by upwards of one hundred members and friends of the National Chrysanthemum Society, December, 1886."

Mr. Holmes in returning thanks, said that his connection with the Society extended over a period of fourteen years, as on Oct. 10, 1872, he was elected a member of the original Stoke Newington Chrysanthemum Society, then meeting at the old "Rochester Castle," and soon after he was placed on its committee. He was not long after advanced to the post of Honorary Secretary, and in course of time, thinking the operations of the Society should cover a wider field, he proposed that the show be held at Hackney. Eventually this was agreed to, and the Society then took upon itself the designation of the Borough of Hackney Chrysanthemum Society. When he became secretary there were just over fifty members; when this Society became the National, there were above ninety members; and the wisdom of giving the Society a national character was shown by the fact that there were now 399, and some twenty-five more for nomination. During the two years the Floral Committee of the Society had been in existence, 257 new varieties of Chrysanthemums had been submitted for consideration, and 44 certificates were awarded. At the November Show at the Royal Aquarium, more than 372 blooms of Chrysanthemums were staged in competition. Mr. Holmes concluded by warmly acknowledging the great services the horticultural Press had rendered to the Society.

SCOTLAND.

SCOTTISH HORTICULTURAL ASSOCIATION.

(Continued from p. 760.)

ON the 7th inst. the above Association held its ordinary monthly meeting in their rooms, 5, St. Andrew Square, Edinburgh, Mr. A. Milne, President, in the chair. Mr. John Thomson, Clovenfords, read an interesting paper on "The Vine," dealing chiefly with seedlings of recent introduction, pointing out the peculiarities of such varieties as Alwick Seedling, Duke of Buccleuch, Waltham Cross, White Lady Downe's, Duchess of Buccleuch, and others, and with the diversity of opinion that existed among cultivators regarding these varieties severally. Mr. Thomson pointed out that it was unfortunate that adverse opinion on such matters was not always supported by conclusive evidence of the bearing of local circumstances on the case in point. Regarding the difficulty in settling on what grounds Alwick Seedling Grape has been so much condemned, he stated his belief that this peculiarity was mainly due to purely local conditions, particularly such as led to over-luxuriance in the Vine; moist localities, and

very rich borders being the principal causes of want of fertility in Vines that were, like the variety in question, hereditarily predisposed that way. Over-luxuriance caused an excessive development of moisture on the stigma, which prevented the action of the pollen on that organ at the proper time. The paper discussed the merits as regards quality of many of the newer sorts, and claimed the highest consideration for the Duke of Buccleuch and the Duchess of Buccleuch. They could not be put forward as market or popular varieties, because of their bad travelling qualities, but wherever the highest excellence in size, texture, and lusciousness were required for home use, the Duke would hold its own against all comers; while the Duchess in point of deliciousness of flavour was incomparable.

In the discussion that followed the reading of the paper, Mr. Mathew Todd, florist and fruiterer, dealt with the value of any particular variety of Grape from the standpoint of the market dealer. To be popular, it must have a good appearance and must keep and carry well—black Grapes being generally speaking preferred to light coloured sorts, flavour being the very last consideration, and having no weight in deciding the choice of customers, if all the other qualities were up to the mark. Mr. Hugh Fraser and others took part in the discussion, and their much interest into the proceedings of the evening.

EDINBURGH BOTANICAL: DECEMBER 9.

H. H. JOHNSTON, ESQ., exhibited and presented to the Society specimens of two Orkney plants collected by him last summer. *Sagina maritima*, Don, in a very contracted form, one-third to 1 inch high and one to three flowered, was collected at the Ness of Ramnago, Sandwick, on the mainland, on July 23. It grew among short, detached, and sterile pasture, within a few feet of the edge of the cliffs, and in a situation exposed to the salt spray of the Atlantic Ocean, and the full force of the westerly gales which are so prevalent in the Orkney Islands. Professor Babington, to whom specimens of the Orkney *Sagina* were sent, wrote that he had apparently the same plant, rather more luxuriant, from Far-out Head. The pasture among which the *Sagina* grew was fully examined by Dr. Johnston, who found that it was composed of the following eleven species of plants, all of which were in a very stunted condition:—*Cochlearia officinalis*, Linn.; *B. alpina*, Wats.; *Cerastium triviale*, Link.; *Sagina maritima*, Don; *Armeria maritima*, Willd.; *Euphrasia officinalis*, Linn.; *Plantago maritima*, Linn.; *b. minor*, Hook. and Arn.; *P. coronopus*, Linn.; *Festuca rubra*, Linn.; *Euryochium prolongum* (Linn.), Sch.; and an undetermined species of fungus, of which only one specimen was observed. The other plant exhibited was *Carex flava*, Good.; *C. hancockiana*, Degl., which is described in *English Botany*, ed. 3, under the name of *C. flava* var. *sterilis*, and is synonymous with *C. flava*, Koch et Auct. plur. (non Smith). The specimens were collected in a marsh near North Dam, in Hoy, on August 9, 1886. The variety *sterilis* is distinguished from *C. flava* by its denser tufted habit, pale yellow-green coloured leaves, uninflected perianth, and by never producing mature fruit, either in the wild state or under cultivation.

Dr. Boswell, who first found this plant in Orkney, at Piggar, Swanbister, Orphir, on the mainland, contributed notes to the Report for 1876 of the Botanical Exchange Club, on specimens collected by him at that station in August, 1875. He then considered *sterilis* to be a hybrid between *C. flava* and *C. flava*, both of which he found growing in the same marsh with it. Now however, he is of opinion that *sterilis* is a sterile form of *C. flava*, though it is just possible that it may be a hybrid between *C. flava* and *C. flava*, but it is certainly very much nearer to the *C. flava*. Since Dr. Boswell's discovery of this interesting plant at Piggar, it has been found at three other stations in Orkney, viz., Navers Dale, Orphir, on the mainland, by Mr. W. Irvine Fortescue, near South Dam, in Hoy, on August 20, 1885, by Mr. Fortescue, in company with Dr. Johnston; and near North Dam, in Hoy, on August 9, 1886 by the Rev. W. R. Ginton, in company with Dr. Johnston.

REPORT FOR NOVEMBER, 1886, OF THE BOTANICAL GARDEN, EDINBURGH.

The past month of November has been very mild and dry generally. Seldom have we had so little frost to record for the time of year and throughout the month has been most favourable for all outdoor gardening work. The thermometer was at or below the freezing point on ten mornings, indicating collectively 17° of frost as against 65° for the corresponding month last year. The lowest readings occurred on the 18th, when the glass registered 30°; 19th, 30°; 21st, 30°; 22d, 26°; 26th, 30°. The highest morning readings were on the 1st, 45°; 2d, 45°; 3d,

50°; 15th, 48°; 24th, 48°. Rain fell on ten days, and the prevailing winds were westerly. During the first week of the month severe storms of wind took place, which cleared off with but few exceptions, any leaves that still remained on deciduous trees. Many autumn flowering plants and annuals have had their flowering season prolonged to an extent quite unprecedented. At the end of the month large numbers were still in blossom. Early spring bulbs, such as Snowdrops, Scillas, Narcissi, and others, are already pushing through the soil, showing that a considerable amount of growth has taken place. Amongst the finest plants in flower out-of-doors during the month were *Primula capitata*, very dark seedling forms; Christmas Roses of different kinds, *Chrysanthemums*, and *Jasminum nudiflorum*.

For the handsome varieties of *Primula capitata* we are indebted to Dr. King, of Calcutta, one of the local secretaries of the Society, who, in December last, sent to the garden a valuable collection of rare Indian Primrose seeds. Many of the species are entirely new to European gardens. The seeds were gathered in high elevations of the Sikkim Himalayas. Nearly all the kinds have germinated and grown well at the garden, a few have already flowered, but we may expect to see them in greater perfection next spring. The most conspicuous shrubs in fruit were the various Hollies, *Cotoneasters*, *Euonymus*, and *Snowberries*. The following plants came into flower on the rock garden during November, viz.:—*Aster Reevesii*, *Eucomis punctata*, *Gynerium argenteum*, *Helleborus olympicus*, *H. o. albus*, and *H. purpurascens* variety, *R. Lindsay*.

REPORT FOR NOVEMBER, 1886, OF THE GLASGOW BOTANICAL GARDEN.

The thermometer has been at or below the freezing point eleven times during the month, the lowest temperature registered being 27°, or 5° of frost, during the night of the 25th. The lowest day readings were 39° on the 7th, and 40° on the 15th and 30th respectively. The highest was 53°, on the 20th. Total frost recorded was only 27°.

Excepting the last few days, the weather has been fine for the month, and closes one of the mildest autumns of which I have any record.

A considerable quantity of green foliage still hangs on several species of *Crataegus*, and many other deciduous trees have retained their leaves much longer than is usual, the young wood being as a consequence imperfectly matured.

In a nursery near here I saw a few fully developed *Dahlia* blooms on the 24th, and numbers of bedding *Pelargoniums* to all appearance very little injured. Various blooms of *Polyanthus*, double *Daisy*, and *Wallflowers* have had a premature appearance. *R. Butler*.

ON THE FLORA OF ICELAND.

NOTWITHSTANDING that the Icelandic flora is very poor, and most of the plants develop not before the month of May or June, to be stopped again in their growth already in September, the vegetation is as luxuriant and rapid (in sheltered localities) as in other more southern countries, but the spring storms—occurring here so very often and accompanied by severe cold—are very disadvantageous to all plants in their first period of development; this is also the cause of the dwarf appearance of all Icelandic species when they are not protected from the winds; vegetation is possible only for a few months, and when the summers are unfavourable it is almost at zero.

The flora of North and South Iceland is about the same in character, which is very remarkable, considering the great difference in mean temperature. Even the mountain flora presents no difference with that of the lowlands.

Compared with former times the vegetation of the island has decreased; it is known that the first settlers were obliged to cut a way through the Birch forests with the axe; the masses of bogwood dug up everywhere in the present time confirm the truth of these assertions; but the cause of this decrease of vegetation is not a change of climate or volcanic eruption, but simply the destruction of the trees by the natives themselves when using them as fuel or for other domestic purposes. A very good example of this destruction is the forest *Halskogur* in the *Þrysohallur*. This was very extensive in the year 1752, but wholly cut down in 1814; in 1874 it was again of a considerable size; one of the largest of the Birch forests, or bushes, as they may be called, is the *Nupstadorskogur*, on the southern side of the *Yatna Jökull*; but the largest of all is the *Hallormssladarskogur*, on the river *Ljardalur*; many birds animate the scene in these bushes, so that it differs greatly from

the desolate and melancholy appearance of the lava fields that cover so large a part of the area of the island. Some of the trees reach 10 or 15 feet in height, but these are exceptions.

Skrubus aucuparia, L., is another plant that reaches in some places to 15 or more feet. At *Akureyri*, under 65° 40' N. latitude, there is a specimen of 25 feet, but it is protected by a wall; at some distance from this place there is also a Birch bush, where the trees are as large as common Hazel-nut plants. Some Birches (*Betula intermedia*, Thom.) in the northern parts reach also 20 feet in height. In the vicinity of *Havamora* there is a small lake with a grassy island in it; on this latter there is found a specimen of the Scotch Fir (*Pinus sylvestris*, L.), the only one in Iceland.

Now we will treat the flora more in detail. The arctic regions of Russia and Norway are relatively rich in species of plants compared with Iceland; this must be ascribed, in the first place, to their warmer summers. It would be difficult to find any other country on the globe of the same area, producing so few species of plants as Iceland. Notwithstanding this there are many plants to be found that would interest the botanist, as *Azalea procumbens*, L.; *Cardamine hastulata*, Sm.; *Rubus saxatilis*, L.; *Erigeron alpinum*, L.; *Saxifraga nivalis*, L.; *S. rivularis*, L.; *S. cernua*, L.; and *S. oppositifolia*, L.; *Silene acaulis*, L.; *Veronica alpina*, L., and *V. fruticulosa*, L., all found on the continent, but on the highest mountain peaks, while in Iceland they are to be seen in lowlands, near the coast.

Shore-plants, as for instance; *Silene maritima*, With.; *Lithyus maritimus*, Bigelow; and *Elymus arenarius*, L., are seen many miles from the coast, in the interior, which is only to be explained by the sea climate and the complete insularity of Iceland.

Of 344 Icelandic species 123 are not found in Greenland, but all plants found on the island are also indigenous to Scandinavia, with the exception of only five species:—*Pleurogyne rotata*, Griseb.; *Epilobium latifolium*, L.; *Plantanthera hyperborea*, L.H.; *Glyceria arctica*, Hook., var. *laxa*, Lange; and *Alchemilla conjuncta*, Bab. The four first-named plants are also found in Greenland, but the fifth must be regarded as naturalised from Europe.

The only species found on the lava plateau in the north (the *Hraun*) is *Silene acaulis*, L.

On a height of 4140 feet above the sea level the following plants were gathered:—*Empetrum nigrum*, L.; *Silene maritima*, With.; *Viscaria alpina*, Don; *Cerastium alpinum*, L.; *Arabis petraea*, Crtz.; *Arabis alpina*, L.; *Saxifraga oppositifolia*, L.; *S. rivularis*, L.; and *S. decipiens*, Ehrh.; *Thymus serpyllum*, L.; *Achillea Millefolium*, L.; *Saxifraga glauca*, L.; *S. herbacea*, L.; *Carex incruva*, L.; *Elymus arenarius*, L.; *Poa alpina*, L.; *P. cernua*, Sm.; *Festuca ovina*, L.; *Juniperus alpina*, L.; *Equisetum variegatum*, Schleich., &c.; so it is almost impossible to fix a snow-line on this island—the plants growing on the mountains and in the lowlands are the same species.

Lindsay has found that out of 426 plants indigenous to Iceland only seventy-two species are not to be seen in the British flora, while *Babington* mentions out of 433 species sixty-two as not British. This proves the near relation between both floras. Very rare Scotch mountain plants, as *Silene acaulis*, L., and *Lychnis alpina*, L., are found in Iceland in the lowlands, and are the commonest of the whole flora.

Cardamine hirsuta, L., and *Capsella Bursa pastoris*, Moench, reach only 1 or 2 inches; *Caltha palustris*, L., and *Silene Armeria*, L., are mostly seen in morasses; *Alchemilla alpina*, L.; *A. vulgaris*, L.; *Rhodiola rosea*, L.; *Saxifraga aizoides*, L.; *Silene acaulis*, L.; *Dryas octopetala*, L.; *Empetrum nigrum*, L.; *Calluna vulgaris*, Sal.; *Vaccinium Myrtillus*, L.; *V. uliginosum*, and *V. vitis-idaea*, L., are all found on the mountains as well as on the shores.

Arctostaphylos Uva ursi, L., and some dwarf Willows cover the mountain plateau in the north, but everywhere the flowers of *Silene acaulis*, L., are seen through the branches of the shrubs just named.

The most striking contrast with the uniform brown colour of the surrounding desert presents the vegetation near the hot springs. Near those of *Laugarnes*, *Poa annua*, L., and *Stellaria media*, Vill., were found with their roots in the hot water, the first in a vigorous state, but the latter dwarfish and of a yellow colour. In the vicinity of the springs there were seen the most common weeds in a very luxuriant

growth. The same vigorous vegetation was observed by Hooker near the hot springs of India.

Only three decidedly arctic species are found on the island, viz., *Gentiana detonsa*, R.; *Pleurogryne rotata*, Gris.; and *Epilobium latifolium*, L.

Remarkable is the fact observed by Dr. Keilhack on an ascent of a glacier in the southern part of Iceland, that many arctic plants, as *Erigeron alpinum*, L.; *Saxifraga decipiens*, Ehrh., &c., were found in a more luxuriant state on the mountains and near the ice of the glaciers than in the lowlands, notwithstanding the higher temperature of the lower regions. In the first case they flowered many weeks earlier than in the latter.

The vegetation on the lava fields depends on the age of this stone, and also on the place where it is situated. When old lava lays in a sheltered situation and near brooks or small rivers then there are many plants that will vegetate on it. Even Willows are sometimes found in such places, but on lava of recent date not a trace of vegetation is to be found.

When the plants commence to flower they follow each other in rapid succession.

The following short remarks about some species may follow here:—

Rosa hibernica, Hook., is found in Iceland, but very rarely in flower.

Dryas octopetala, L.; *Stactea armeria*, L.; and *Silene acaulis*, L., are seen almost everywhere.

Pyrus domestica, L., is found in a few places. Mackenzie has seen some specimens reaching 8 feet in height.

Betula alba, L., and *B. nana*, L., form the "forests" or bushes on the island.

Carices are very plentiful, the soil being for a great deal morass.

Between the moss many species of *Saxifraga* occur. *Callitriche hamulata*, Kitze; *Myosotis alpestris*, K.; *Rumex crispus*, L.; *Salix lapponica*, L., and *Koeleria cristata*, Pers., are also Icelandic species.

Calluna vulgaris, Sal., the common Heath species, is the first plant growing on the lava.

The splendid yellow flowers of *Papaver nudicaule*, L., are mostly seen on the lava or lava-sand.

Dellis perennis, L., was found in two places—in the Shaga-fjord and Eysafjord.

Vicia angustifolia, Roth, also in two places.

V. sativa, L., outside Keikivik (naturalised).

Sanguisorba officinalis, L., was seen in one place.

Spinacea Ulmaria, L., in four places.

Tussilago Farfara, L., was found only once in the Eysafjord.

Glaux maritima, L., and *Polygonum Persicaria*, L., were also seen only once.

Pisum arvense, L., near Eyarbakki, South Iceland.

Poa annua, L., was discovered on Grimsey Island, but only once.

Epilobium angustifolium, L., forms a beautiful red carpet on the sides of brooks and small rivers.

Ranunculus glacialis, L., occurs only on the steep ascents of the mountains, and in the vicinity of deep snow.

R. acris, L., was found in the Eskifjord.

Cochlearia officinalis, L.; *Saxifraga hypnoides*, L.; *Silene maritima*, With.; and species of *Cerastium*, are mostly found on a black sandy soil, and on hills.

The following dates of the opening of the first flower were noted near Keikivik:—

Alchemilla vulgaris, L., April 28, 1873.

Empetrum nigrum, L., May 16, 1874.

Silene maritima, With., June 6, 1873; June 12, 1874; June 8, 1875.

Armeria maritima, W., May 8, 1873; May 6, 1874.

Salvia herbacea, L., May 6, 1873.

Pinguicula vulgaris, L., May 25, 1874; May 18, 1875. *M. Brysmans.*

(To be continued.)

A TRIAL of some importance took place on Wednesday last, in the Court of Queen's Bench, before Mr. Justice Manisty and a special jury—*Waldin & Simpson v. J. Robinson*. The plaintiffs, wholesale seedsmen in Exeter Street, Strand, sued the defendant to recover a debt; this elicited a counter-claim from the defendant for damages alleged to have been caused by the inferior quality of Cauliflower seed supplied by the plaintiffs in 1883. The case was settled on the terms of the sale clause which plaintiffs printed on all their invoices, coupled with the fact, as found by the jury, that the plaintiffs did not, at the time of sale, give a warranty with the seed. Judgment was given for the plaintiffs.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DECEMBER 15, 1886.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				Hygrometrical Direction from Glaisher's Tables 5th Edition.	WIND.	RAINFALL.
	Mean Reading Reduced to 32° Fahr.	Deposited on 48 Hours.	Highest.	Lowest.	Range.	Mean for Day.

- Dec. 9.—Wet and dull till 9 A.M., then fine and bright. Dull afternoon.
- 10.—Slight snow fell in early morning, fine and bright day afterwards.
- 11.—Wet morning. Fine but dull afternoon.
- 12.—Fine and bright generally.
- 13.—At times dull. Showery morning. Fine and overcast afternoon.
- 14.—Wet and overcast all day. Wet night.
- 15.—Showery in the morning; at times bright, but generally dull and overcast afternoon.

LONDON: Atmospheric Pressure. — During the week ending December 11, the reading of the barometer at the level of the sea increased from 29.87 inches at the beginning of the week, to 29.99 inches by the morning of the 5th, decreased to 29.52 inches by 1 P.M. on the 7th, increased to 29.62 inches by the afternoon of the same day, decreased to 28.33 inches by 9 P.M. on the 8th (a point lower than any since 1843, January 13, when the reading here was 28.27 inches), and was 29.43 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.03 inches, being 0.63 inch lower than last week, and 0.65 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 54° on the 6th; the highest on the 5th was 41°. The mean of the seven high day temperatures was 46° 1.

The lowest in the week was 29° on the 5th; the lowest on the 6th was 49°. The mean of the seven low night temperatures was 37° 5.

The greatest range of temperature in one day was 15° on the 11th; the smallest was 2° on the 7th. The mean of the seven daily ranges was 8° 6.

The mean daily temperatures were 36° 3 on the 5th, 51° 5 on the 6th, 41° 7 on the 7th, 42° 6 on the 8th, 42° 2 on the 9th, 38° 3 on the 10th, and 45° on the 11th. These were all above their averages with the exception of the 5th and 10th, which were 6° 1 and 2° 7 below, by 9° 9, 0° 2, 1° 2, 1° 0, and 4° 2 respectively.

The mean temperature of the week was 42° 4, being 5° 2 higher than last week, and 1° 1 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 72° on the 8th. The mean of the seven readings was 63° 4.

Rain.—Rain fell on five days, to the amount of 0.71 inch.

ENGLAND: Temperature.—During the week ending December 11, the highest temperatures were 55° at Truro, 54° 6 at Nottingham, and 54° at Plymouth and Blackheath; the highest at Sunderland was 46°, at Newcastle 48°, and at Preston 49°. The general mean was 51° 8.

The lowest in the week were at Hull 28°, at Nottingham 28° 1, and at Blackheath 29°; the lowest at Liverpool was 35° 4, at Newcastle 35°, and at Plymouth 34°. The general mean was 31° 5.

The greatest ranges of temperature were at Nottingham 26° 5, at Blackheath 25°; and at Wolverhampton 23° 6; the least ranges were at Newcastle 13°, at Sunderland 14°, and at Preston 18°. The general mean was 20° 3.

The mean of the seven high day temperatures was highest at Truro, 51° 9, at Plymouth 50° 8, and at Bristol 48° 9; and lowest at Newcastle, 41° 5, at Sunderland 42° 8, and at Preston 44° 3. The general mean was 46° 5.

The mean of the seven low night temperatures was highest at Truro, 38° 3, at Plymouth 38° 1, and at Blackheath 37° 5; and lowest at Wolverhampton, 32° 5, at Hull, 33°, and at Sunderland 33° 8. The general mean was 35° 8.

The mean of the seven daily ranges was greatest at Truro, 13° 6, at Wolverhampton 12° 9, and at Nottingham 12° 8; and least at Newcastle, 5° 5, at Blackheath 8° 6, and at Preston 8° 7. The general mean was 10° 7.

The mean temperature was highest at Truro, 45° 4, at Plymouth 42° 7; and lowest at Sunderland, 38° 2, at Newcastle, 38° 6, and at Wolverhampton 38° 8. The general mean was 41°.

Rain.—The largest falls were 2.16 inch at Sheffield, 1.83 inch at Liverpool, and 1.60 inch at Preston; the smallest falls were 0.64 inch at Newcastle, 0.71 inch at Blackheath, and 0.88 inch at Nottingham. The general mean fall was 1.30 inch.

SCOTLAND: Temperature.—During the week ending December 11, the highest temperature was 53° 1 at Glasgow; the highest at Aberdeen was 43° 2. The general mean was 50° 8.

The lowest temperature was 28, at Greenock and Perth; the lowest at Glasgow and Paisley was 33°. The general mean was 30° 2.

The mean temperature was highest at Glasgow, 40°; and lowest at Aberdeen, 36° 7. The general mean was 38° 7.

Rain.—The largest fall was 2.32 inches, at Greenock; and smallest at Dundee 0.70 inch. The general mean fall was 1.19 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, December 13, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W. The weather has been in an extremely rough and unsettled condition over the whole kingdom. Heavy falls of rain occurred very generally, while at all our more northern stations showers of hail or sleet were also frequent. Over the southern parts of England some thunder and lightning were experienced. In the metropolis and its neighbourhood the thunderstorm (at 9 A.M. on Wednesday) was accompanied by a severe hailstorm.

The temperature has ranged from 1° to 3° below the mean in Ireland and Scotland, and has been about equal to it over the north of England, but in all the other English districts it has been 2° or 3° above the normal value. The highest of the maxima, which were recorded on different dates in the various parts of the kingdom, ranged from 43° in "Scotland, N.," to 54° in "England, S." The lowest of the minima, which were also registered on irregular dates, varied between 24° and 27° in Ireland, 25° and 29° in Scotland, and 27° and 31° in England. In the Channel Islands the lowest reading was 33°.

The rainfall has been more than the mean in all districts. In most localities the excess has been considerable, but especially so in "Ireland, S."

Bright sunshine has been very little prevalent, the percentages of the possible amount of duration ranging from 32 in "England, N.E.," to 17 in "Ireland, N.," and to only 2 in "Scotland, W."

Depressions observed.—Soon after the commencement of this period an abnormally deep depression approached our western coasts from the Atlantic, and after travelling eastwards to the North of England, moved slowly in a north-easterly direction to Scandinavia, and became much less deep. The gales caused by this disturbance over our Islands and the greater part of France were exceedingly violent, both in the east and the rear of the centre, and prevailed, with scarcely any intermission, from late on the 7th till the evening of the 9th. By the 12th the disturbance had apparently filled up over Scandinavia, but another depression, which subsequently moved eastwards, had been developed over the North Sea, causing moderate

to strong westerly gales on the more southern parts of England and in the Channel. At the end of the period a depression appeared off our south-west coasts and the wind in most parts of our islands shifted to the eastward, and blew freshly or strongly,

Answers to Correspondents.

TO THE TRADE.—Members of the Trade will oblige by sending notes on matters of Trade Interest, Cultural or Commercial. Short notes of daily experience are what are most useful.

AZALEA: F. T. M. We do not see any evidence of foul play. The foliage has been much infested with thrips, and the appearance of the leaves may be due to over-fumigation and bad management.

BOOKS: J. F. O'B. It very much depends for what purpose you require them. Both are good in their way. If you know nothing of the subject already take the Primer first. The other is an extended vocabulary. We believe your question was answered before.

BOUVARDIAS AND LILY OF THE VALLEY: A. B. The Bouvardias, if they have been suitably prepared in the early autumn, will expand their blooms well in the temperature of an intermediate-house—that is, in a temperature of from 45° to 50° Fahr. at night, with a rise of from 15° to 20° Fahr. in the daytime. The Lily of the Valley will not stand the heat indicated, but at the expense of less endurance in the flowers. Lily of the Valley, after sinking the pots containing the germs to the rims in cocoa-fibre or moss, afterwards covering with moss to the depth of 3 inches, may at once be treated to a bottom-heat of 90° to 95° Fahr., never allowing any variation. In two or three weeks the plants will have grown a few inches, and the flowers will have made their appearance. After gradually exposing them to light for a day or two, they may be moved to the bottom-heat, and placed where they get plenty of light. From February onwards a bottom-heat not exceeding 90° may be employed, and still less than that, as the natural blooming period approaches.

CHRYSANTHEMUM SPORT FROM C. FULTON: J. L. The colours are rich, and although the form of the flowers may be a little faulty, we think there is the making of a good flower in it.

CORRECTION: CERTIFICATED LILIA ANCEPS VIRGINICALIS ("Plants Certificated by the Royal Horticultural Society," p. 750): F. A. P. The Certificate for this plant was awarded to F. A. Philbrick, Esq., Q.C., Oldfield, Bickley, and not to Mr. H. Heims, his gardener.

CYPERIDIUM INSIGNE: F. S. It is not common for this plant to produce two flowers on one spike, but it does occasionally do so.

DISEASED PLANTS: S. Daxill. Your Pears are affected by the disease figured in our columns, p. 697, vol. xxiv., 1885. The bulbs, as you suppose, are attacked by the Eucharis mite.

EUCHARIS: T. M. S. Your "double" Eucharis is not double in the ordinary acceptance of the term. The peculiarity arises from the union of two flowers.

EVENT AND VALUE OF FRUIT AND VEGETABLES SOLD IN COVENT GARDEN MARKET: A. Scandall. We cannot answer your enquiry.

FUNGUS UNDER BEECH TREES: J. A. Amphill. Xylaria polymorpha.

HARD WATER FOR PLANTS: T. C. Such hard water as you are obliged to use is bad both for the roots and foliage of plants. Can you not get enough for several days' use put into an open-air cistern, where by allowing it to stand for a day or two the matters held in solution would fall to the bottom? It would then, if drawn off quickly, be more fit for watering plants.

INSECTS: I. M. The insects found on the Savoy Cabbage are the larvae of one of the species of aphid-feeding Ligaster (Syrrhaptes sp.). I. O. W.

LARGEST MANGEL, &c.: C. D. We have no record of matters which are not of horticultural interest. Ask one of the agricultural papers.

NAMES OF FRUITS: Herbert & Co. Apple: Golden Reinette.—Hants: 1, Beurré Bosc; 2, Fasse Colmar; 3 and 4, rotten.—T. Clark. Pear: West of Winkfield. Apple: 6, 31, 29, 31, Blenheim Orange; 10, King of the Pippins; 30, Hollandbury; 17, Dumelow's Seedling; 7, Reinette du Canada.

NAMES OF PLANTS: A. M. Aspecies of Casuarina.—T. K. Spiraea prunifolia.—B. H. Berberis Wallichiana.—W. H. We cannot undertake to name plants from leaves only.

ONIONS: B. The great secret is to have well matured bulbs, and to keep them as dry as possible and in as uniform temperature as possible.

PAPERS READ AT THE POTATO TRICENTENARY: S. R. These are not as yet published, nor do we know who they will be.

CATALOGUES RECEIVED.

Markets.

COVENT GARDEN, December 16.

LARGE quantities of goods have been cleared in our market during the past week, but prices generally have been scarcely maintained. Grapes, especially feeling the depressing influence, James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and items like Apples, Grapes, Kent Cobs, Lemons, Pears, Pine-apples, St. Michael.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: s. d. s. d. and items like Artichokes, Brussels, Carrots, Celery, Cucumbers, Endive, Herbs, Lettuce, Mushrooms, Onions, Parsley, Potatoes, Shallots, Turnips.

POTATOS:—Kent Regents, 8s. to 10s.; Schoolmasters, 70s. Beauty of Hebron, 10s.; Magnum, 6s. to 80s. per ton.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and items like Aralia Sieboldi, Arum Lilies, Azaleas, Begonias, Bouvardias, Chrysanth., Cyclamens, Dacrydium, Epiphyllum, Erica gracilis, Ficus, Heliotropium, Mignonette, Myrtles, Pelargonium, Pyrethrum, Ruscus, Stephanotis, Tuberose, Violets, Magnolia, Pelargonium, Trusses, Primulas, Bunches, Pyrethrum, Ruscus, Stephanotis, Tuberose, Violets, Magnolia.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and items like Arum Lilies, Azaleas, Bouvardias, Camellias, Carnations, Chrysanth., Eucharis, Gardenias, Heliotropium, Jasmine, Lappageria, Magnolia, Mignonette, Pelargonium, Pyrethrum, Ruscus, Stephanotis, Tuberose, Violets, Magnolia.

* These prices will be subject to great alterations towards the end of next week, on account of their decoration for Christmas.

SEEDS.

LONDON, Dec. 15.—Messrs. John Shaw & Sons, Seed Merchants, of 87, Mark Lane, E.C., report to-day's market thinly attended, with but little business doing. Clover seeds of all kinds in the meantime remain exceedingly firm. Italian and perennial Rye-grasses are again slightly dear. Unprecedentedly low rates are now ruling for spring Tares. Hemp seed is also cheaper than ever before known. There is scarcely anything doing in bird seeds; quotations unchanged. Choice New Zealand Cocksfoot is now available in very moderate terms. Feeding Linseed is weaker. Blue Peas move off slowly at last week's prices.

CORN.

MARK LANE, Dec. 15.—The heavy storms of the past week had not as yet to have done much mischief to the growing crops, which continue to be reported healthy and promising. The supply of English Wheat to-day

was limited and the market firm, especially towards the close, when 6d. to 1s. advance was generally obtained. The imports of foreign Wheat in the past week were also light, and the market equally firm to-day for these descriptions, ruling 6d. to 1s. per quarter above Monday List. Flour sustained a rise of fully 1/2 per sack. Mazes were quoted 6d. above the rates of the day se'night. Grinding Barley brought steady value, malting kinds met very little attention. Beans advanced 6d. to 1s. per quarter, and Peas were very firm from scanty supply. Oats unaltered.

Dec. 15.—Business in Wheat and flour was limited, but both articles were firm; some kinds of red Wheat, including Baltic and American winter, were rather against buyers, as was also flour in some instances. Malting Barley met very little enquiry; grinding sorts were steady but quiet. Beans and Peas were firm; Oats, of which the stocks are heavy, were a dull sale; and Malze continued very firm.

Average prices of corn for the week ending Dec. 11:—Wheat, 37s. 1d.; Barley, 27s.; Oats, 16s. 6d. For the corresponding period last year:—Wheat, 35s. 6d.; Barley, 29s. 8d.; Oats, 18s. 2d.

CATTLE.

THE CHRISTMAS MARKET: Dec. 13.—There was a falling off, as compared with last year, in the number of cattle and sheep sent to the Christmas cattle market at Islington, but all the noted breeds were splendidly represented. A reduction in the average weight of cattle was noticed, but this was compensated for by an improvement in point of quality for trade purposes. Business in the cattle department opened very slackly, but improved subsequently; nevertheless, the prices were disappointing to senders, ruling quite 6s. per 8 lb. under, or from 2s. to 2s. per head less than realised on the Christmas market last year. The Scots brought 4s. 8d. to 5s.; Herefords, Kums, and Devons, 4s. 6d. to 4s. 10d.; and Shortorns, 4s. 4d. to 4s. 6d. per 8 lb.

The sheep supplies were 236 less than last year, and, on the whole, were not so good a show, but they included some excellent pens of Down wethers. The trade in this department was slow, but the prices realised compared well with last year, showing an advance of 2d. per 8 lb., or about 1s. 6d. to 1s. per head. The total number of beasts on offer was 6320; there were 7170 sent in last year. The sheep numbered 11,350, against 13,650 in 1885.

FRUIT AND VEGETABLES.

COLUMBIA (East London): Dec. 15.—Good supplies of all kinds of produce. Trade slow, at prices as follows:—Cauliflowers, 11. 6d. to 2s. 6d. per dozen; Beet-roots, 1/4 to 6d. do.; Savoys, 2s. 10s. 3s. per tally; Cabbages, 1s. 6d. to 2s. do.; bunch Grapes, 1s. to 1s. 6d. per dozen; bunch Turnips, 1s. 6d. to 2s. do.; bunch Carrots, 1s. to 2s. do.; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; Celery, 6d. to 1s. per bundle; Onions, 1s. to 1s. 6d. per bushel; Mangels, 1s. to 1s. 6d. per ton; Apples, 3s. 6d. to 7s. per bushel; Pears, 4s. to 10s. do.

STRATFORD: Dec. 15.—There was a good supply of produce, and a fair trade was done at the following prices:—Savoys, 3s. 6d. to 4s. per tally; Cauliflowers, 1s. 6d. to 2s.; Turnips, 2s. to 2s. 6d. per dozen bunches; do. 3s. to 3s. 6d. per ton; Carrots (cut feeding), 2s. to 2s. 6d. do.; Parsnips, 6d. to 1s. per score; Mangels, 13s. 6d. to 17s. 6d. per ton; Swedes, 15s. to 22s. do.; Apples, English, 3s. 6d. to 4s. per bushel; Watercress, 6d. per dozen; Celery, 8d. to 10d. per roll.

POTATOS.

LONDON AND SPITALFIELDS: Dec. 14.—A quiet market, but best samples supported in value. Regents, 70s. to 110s.; Magnum Bonus, 50s. to 95s.; Hebrons, 70s. to 110s.; and Victorias, 60s. to 90s. per ton.

COLUMBIA (East London): Dec. 13.—Quotations:—Cambridge Regents, 60s. to 65s.; Magnum Bonus, 50s.; Essex Regents, 50s. to 55s.; and York and Lincoln Regents, 60s. to 70s. per ton.

STRATFORD: Dec. 15.—Quotations:—Regents, 70s. to 80s.; best Magnum, 60s. to 70s.; and Fenland do., 50s. to 60s. per ton.

Imports.—The imports into London last week consisted of 6019 bags from Hamburg, 2456 Gent, 2 Amsterdam, 330 Boulogne, 8 sacks from Rotterdam.

HAY.

WHITECHAPEL: Dec. 14.—There were moderate supplies, and a dull trade at the following quotations:—Clover, prime, 83s. to 100s.; inferior, 70s. to 81s.; hay, prime, 70s. to 90s.; inferior, 30s. to 65s.; and straw, 28s. to 30s. per load.

Dec. 16.—A moderate supply was on sale. The trade was dull at the following prices:—Prime clover, 90s. to 100s.; inferior, 70s. to 90s.; prime meadow hay, 70s. to 90s.; inferior, 50s. to 70s.; and straw, 28s. to 30s. per load.

CUMBERLAND (REGENT'S PARK): Dec. 14.—A large supply was on offer, and trade, owing to the weather, in favour of buyers. Quotations:—Hay, 70s. to 100s.; second, 70s. to 80s.; 1/2 hay, best, 78s. to 85s.; second, 50s. to 70s.; and straw, 28s. to 38s. per load.

STRATFORD: Dec. 15.—Quotations:—Hay, 70s. to 80s.; Clover, 70s. to 90s.; and straw, 28s. to 32s. per load.

SPECIAL NOTICE.

and 139 and 141, Cannon Street, London, E.C.

Oil Paint no Longer Necessary.
HILL AND SMITH'S BLACK VARNISH,
for Preserving, Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 11. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
From ALFRED LOWE, Esq., *The Ryton, Alderley Lodge.*
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.
Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.
Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH,

THE TROPICAL AGRICULTURIST,

A MONTHLY RECORD OF INFORMATION FOR PLANTERS. Of Tea, Cocoa, Cinchona, Coffee, Indiarubber, Sugar, Palms, Cotton, Cardamom, Cassia, Ginseng, Nutmegs, Fibrous Plants, and other Products suited for Cultivation in the Tropics. Published at Owerre Office, Colombo, Ceylon, on or about the 25th of each Month. Commenced in June, 1881.

The "TROPICAL AGRICULTURIST" has now an assured position in its large circulation in Ceylon, Southern and even Central and Northern India, the East, Singapore, Sumatra, Java, Borneo, Northern Australia, Queensland, Central America, Natal, Mauritius, and the West Indies. From all substantial planters and agriculturists, it has obtained the approval of the publication and an encouraging measure of support. The English, Indian, and Colonial Press have spoken in commendatory terms of the "T." as being the best of Native Gardens from Sir Joseph Hooker, F.R.S., downwards, and so have all Planters. No Planter should be without it.

Rates of Subscription, including Postage, in advance: Single Copies, 2s. or Rt.; Back Copies, 3s., or Rt. 50.

Any one of the Four Volumes completed (1881-2, 1882-3, 1883-4, 1884-5), bound in cloth, lettered, with Comprehensive Index, for £1 10s. or Rt. carriage prepaid.

THE TROPICAL AGRICULTURIST.

As a medium for English, American, and Australian ADVERTISEMENTS of goods suitable for the tropics, India and Ceylon, the "Trop. Agri." stands unrivalled in West Indies (Central America being included in that term), or connected with agriculture, the "Tropical Agriculturist" stands unrivalled in the Tropics, as being the best of Native Gardens as well as European and American Agriculturists. Being a Monthly Periodical the "Tropical Agriculturist" lies on the table and is very often referred to during each month, a fact which Advertisers will know how to appreciate.

Mr. W. T. THIBSTON DYER, F.R.S., C.M.G., Director of Kew Gardens, writing of the "T. A." refers to it as an astonishing repository of everything relating to the Economic Botany of the East.

For the Sale of Plants, Seeds, Machinery, Implements, &c., used in Tropical Agriculture, (see: 1) Agriculture, no better Advertising Medium exists.

Rates for Advertisements:—2s. Six Words or a Line. Twelve Lines and under, per Line... 1s. 6d. (5 annas) About Twelve Lines... 1s. 10d. (7 annas) Quarter Page (once)... 3s. 6d. (25 annas) 5 per Cent. off Half... 1s. 6d. (10 annas) For each additional Whole... 1s. 6d. (10 annas) insertion.

Communications respecting Advertisements and Subscriptions for the "TROPICAL AGRICULTURIST" may be addressed to A. M. and J. FERGUSSON, Colombo. J. HADDON and CO., 3, Bouverie Street, London, E.C. G. STREET and CO., 39, Cornhill, London, E.C. Or Agents in all parts of the World.

"The Garden Newspaper."—Must have had a thorough training as a Gardener, and be of a literary disposition. Applicants will please state fully what training and experience they have had.—S., care of Editor, 37, Southampton Street, Covent Garden, W.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to A. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish Repeated.

To Noblemen and Gentlemen requiring Land Agents,

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter.—Enquiries should be made to 237 and 238, High Holborn, W.C.

RICHARD SMITH AND CO.

beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they are well able to supply a Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Under Gardeners, Bailiffs, &c.

W. M. CUTBUSH AND SON have at the present time on their List Men whose characters will bear strict investigation, and such as from their personal knowledge can recommend reliable and competent Gardeners and Under Gardeners, either of the above can be suited with reliable, first-class men by applying to Wm. Cutbush & Son, Highgate Nurseries, London, N.

Gardeners.

THOMAS KENNEDY AND CO. have on their Register a number of first-class GARDENERS, FORESTERS, &c., wishing engagements, and will be glad to furnish particulars to any one in want of same.—THOMAS KENNEDY AND CO., 108, High Street, Duffries, N.E.

SCOTCH GARDENERS.

—JOHN DOWIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting for engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

MANAGER.—Mr. W. CALE can recommend

a thoroughly experienced man to take sole Management in a Large Establishment, to Grow Fruit, Tomatoes, Hard and Softened Plants, and Cut Flowers, &c., extensively for Market.—to, Burling Street, Covent Garden, W.C.

GARDENER (HEAD); age 32.—Mr. LEACH

Head Gardener, Albany Park, Guildford, can highly recommend a thorough first-class Gardener.—Address as above.

GARDENER (HEAD), in a good establish-

ment.—Age 30; well experienced in all branches. Good character from present and past employers.—A. BARTER, Evelyn Villa, Algar Road, Isleworth.

GARDENER (HEAD), where more are

kept.—A GENTLEMAN wishes to recommend a thorough good Gardener. Eighteen years' good personal character.—A. B., 64, Colman Street, Bank, E.C.

GARDENER (HEAD); age 35; married.—

Wishes to do for a Lady or Gentleman. M.P., Campsea Ash, Wickham Market, Suffolk, is at liberty to engage with any Lady, Nobleman, or Gentleman, wanting a Gardener. Two years in present situation.—Address as above.

kept, or FOREMAN where several.—Age 28; single; highly recommended by late employer. Many years' experience. Glass, Fruit, Flower, Vegetables, leaving through no fault.—Colonel GARDEN, Stargrove, Newbury, Berks.

GARDENER (HEAD WORKING).—Age 32;

married, no family; practical and competent in all branches. Sixteen years' experience. Good character.—T. S., Elmhurst, Bickley, Kent.

GARDENER (HEAD WORKING), where

three or four are kept.—Twelve years' experience; energetic, well up in Vines, Melons, Cucumbers, Stove and Greenhouse Plants, Roses, Fruit, &c. Good references.—R. W. G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER.—Sir HUMPHREY DE

TRAFFORD will be glad to recommend his Gardener, and can give him a nine years' character. Leaving through no fault.—Sir HUMPHREY DE TRAFFORD, Trafford Park, Manchester.

GARDENER (good SINGLE-HANDED or

DOUBLE).—Age 30; married, an English; total abstainer; twelve years' experience in all branches. Can be well recommended.—GARDENER, Boughton Place, Maidstone.

FLORIST or GARDENER, in a good Market Garden Nursery.—Age 20; good references.—A. L., Oak Villa, Lorne Road, Forest Gate, E.

FOREMAN, in the Houses.—Age 24; ten years' experience; held last situation as Foreman over two years; Good reference from a first-class Gardener.—J. LIDDAIRD, Wethersfield, near Braintree.

FOREMAN, or SECOND.—Age 25; has had twelve years' experience in all branches. Good character.—H. W., Braxated Park, Witham, Essex.

To Nurserymen.

FOREMAN PROPAGATOR.—Age 29; fifteen years' experience, the last six years in leading London nurseries. Thoroughly practical in Stove and Greenhouse Cultivation, Forcing and Production of Cut Flowers in quantities, &c. First-class character.—H. B., 34, Edith Grove, Chelsea, London, S.W.

PROPAGATOR and GROWER of Pot

Plants and Cut Flowers.—Age 28; sixteen years' experience.—Please state particulars to H. J. R., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

PROPAGATOR (SECOND).—Age 25;

eleven years' experience in Hard and Soft-wooded Roses, Camellias, &c.—Three years with present employer.—A. NASH, Royal Nursery, Slough, Bucks.

JOURNEYMAN (FIRST), in a good place.—

Age 22; has had nine years' experience in good places. Good character.—A. CANNON, The Gardens, Brookman's Park, Hatfield, Herts.

JOURNEYMAN, in a good establishment.—

Age 21; two years in present situation, four years previous. Can be highly recommended. Leaving through death. Bothy preferred.—J. ATTENBOROUGH, Ansty, Coventry.

JOURNEYMAN.—THE GARDENER, Ted-

worth House, Marlborough, Wilts, can very highly recommend Two Young Men as above, each with five or six years' experience.—Address as above.

IMPROVER, or JOURNEYMAN in Houses.

—Age 17; used to Room Work generally as an assisting Decorator. Good reference.—Apply to G. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, London, W.C.

IMPROVER, in a Gentleman's establishment.

—Age 18; has been in Garden five years.—GARDENER, Eaglehurst, Bathford, Bath.

TO HEAD GARDENERS.—Advertiser can

confidently recommend a young man (age 24) accustomed to Growing Tea Roses, Gardiasis, Ferns, Tomatoes, Cucumbers, &c., in and out of doors, generally.—G. H., 1, Athelstan Road, Harold Wood, Romford.

To Nurserymen and Florists.

HANDY MAN, strong, active, intelligent; age 31, seeks situation. Good Stoker. Understands Potting, Can use the Spade. Willing to make himself useful. First-class references. Please state wages.—Address, LABOUR, 23, Pier Road, Jersey.

MANAGER, or SHOPMAN.—Well ex-

perienced in Seed and Flower Business, and knowledge of Nursery Trade.—A. J., 42, Bell Street, Healey-on-Thames.

MANAGER, or SHOPMAN.—Well up

in all branches, Used to London Trade. Highest reference. Eight years' experience.—J. P., 11, Montpelier Place, Montpelier Street, Brompton, S.W.

TRAVELLER, SHOPMAN, or CLERK.—

Wanted by a young man of experience in the Seed and Nursery Trade, a situation as above. Good references.—J. R., 6, Canning Street, Chester.

years' experience in the Retail Seed and Bulb Trade. Six years with Messrs. James Veitch & Sons, Chelsea. Good references.—S. N. GEORGE, 20, Victoria Road, Putney, S. W.

SHOPMAN (JUNIOR).—Age 20; has good

personal knowledge of the Seed Trade in all departments.—For references apply to DICKSON AND TURNBULL, Brechin, N. B.

HOLLOWAY'S PILLS give marked and

rapid relief. Indigestion gives rise to a large share of the maladies of mankind; it occasions more miseries than the doctor knows names for. It produces fretfulness and irritability of temper, and wasting of the powers of the mind. It digests sprays from many causes, over which HOLLOWAY'S PILLS exert the most perfect control. They act at once on the stomach, liver, bowels, kidneys, and skin, and compel these organs to do their duty. They restore the waning appetite, relieve the nausea and pain, and remove the dyspeptic sick headache, and many nameless torments. No miserable dyspeptic need depend until he has given these truly good Pills a fair, honest, and persevering trial.

W. H. LASCELLES & CO.,

THOMAS GREEN & SON, LIMITED,

Smithfield Iron Works, Leeds, and Surrey Works, Blackfriars Road, London, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their

PATENT WROUGHT-IRON MUNICIPAL OR ANGULAR CHAMBERED AND TUBULAR HOT-WATER BOILERS,

And others with **SHELVES**, and Hollow or Ordinary Cast-iron **GRATE BARS.**

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the **FIRST and HIGHEST PRIZE, a SILVER MEDAL,** at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

— FRONT ELEVATION —

The longitudinal section gives a view of the fire-box, water space, flues, &c.

— LONGITUDINAL SECTION —

The cross section gives a view of the fire-box, water space, and V shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIAL.

MESSES. THOS. GREEN AND SON, LTD., NORTH ST., LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably. I am, Gentlemen, yours truly,

THOS. HEWSON, Borough Engineer.

HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

ADDRESS, 25, Wellington Street, Strand, London, W.C.

THE GARDENERS' ROYAL
BENEVOLENT INSTITUTION.
NOTICE IS HEREBY GIVEN THAT THE ANNUAL
GENERAL MEETING of the Subscribers to this Institution
will be held on FRIDAY, January 5, 1887, at SIMPSON'S,
rot, STRAND, W.C., for the purpose of receiving the
ACCOUNTS, and the REPORT of the COMMITTEE for
the preceding year, and for the ELECTION of OFFICERS for
the ensuing year. Also for the ELECTION of FOUR PEN-
SIONERS on the Funds of the Institution. The Chair will be
taken at 3 o'clock precisely. The Ballot will close at 5 o'clock
precisely.

By Order, EDW. R. CUTLER, Secretary,
30, Parham Street, London, S.W., December 23, 1886.
N.B. The Voting Papers have all been issued; any Sub-
scriber not having received one is requested to notify the same to the Secretary.

GARDENERS' ROYAL BENEVOLENT
INSTITUTION.
HENRY MONTHAN, a CANDIDATE for the
PELTON at the ELECTION on JANUARY NEXT. He
has been in the Trade with Leading Firms for the past forty
years and is now entirely unfitted for work.
The undersigned are therefore solicited from Subscribers prom't
of support at the ensuing Election.

COOPER, F.R.E.S., Calcut Gardens, Reading,** of whom alone the various sorts can be obtained. **PRICE LISTS and PAMPHLETS** on application.

THE FINEST

LATE YELLOW

CHRYSANTHEMUM

IN CULTIVATION

For Cutting Purposes

13

"MRS. JONES,"

WHICH WAS AWARDED A

First-class Certificate

BY THE

NATIONAL CHRYSANTHEMUM SOCIETY,

THIS SEASON.

It is a sport from the well known Japanese variety "ETHEL," and is the exact counterpart of that favourite variety in every way excepting the colour, which is a beautiful rich bright golden-yellow, distinct in colour from every variety in cultivation. I shall have no quantity of flowers until CHRISTMAS, the main batch will be at their best from that time until the END OF JANUARY; showing it to be a specially LATE-flowering variety.

Price, per Dozen, Hundred, and Thousand, upon application.

NEW DESSERT APPLE, "BEAUTY OF BATH."

GEO. COOLING & SONS

Have pleasure in offering a small Stock of this fine early Dessert Apple.

It ripens in July and early part of August, is quite distinct, of medium size, exceedingly handsome in appearance, being beautifully striped with red towards the sun, has a brisk, sweet flavor and is in every respect superior to Juncos or Irish Peach; it is a large and certain cropper, and on that account will be most valuable as a Market variety.

During the past two seasons it has been awarded 1st Prizes in the Dessert Classes at Taunton, Trurobridge, Weston-super-Mare, Keevil, and other West of England Shows, where Apples are always well exhibited.

Strong Maiden Trees, 3s. 6d. each.

Usual Discount to the Trade.

As our Stock is limited we respectfully solicit early orders

THE NURSERIES, BATH.

HEPATICAS, red and blue, 3s. 6d. per dozen. PHLOXES, 1 year, 3s.; 2 years, 5s. per dozen. FRIETHRUMS, 4s. per dozen; 2s. per 100.

PRIMROSES, double white, lilac and sulphur, 3s. 6d. per dozen. PRIMULA SIEBOLDI, 4s. per dozen.

Mixed German IRIS, 2s. 6d. per dozen. Mixed English IRIS, 1s. per dozen; 5s. per 100.

HOLLYHOCK Seedlings, splendid strain, 4s. per dozen; 25s. per 100.

DELPHINIUM Seedlings, all shades, 3s. per dozen. HARDY PERENNIALS in variety, for continuous bloom, 12 kinds, 3s.; 25 kinds, 6s.; 50 kinds, 12s. 6d.; 100 varieties, 30s.; 100 plants in 50 varieties, 28s.; 200 varieties, 60s.

Stove and Greenhouse Plants. Very cheap, clean, and healthy; five houses from 100 to 250 feet long, full of these plants. Very low offers to market for winter and spring stock, 12 varieties, 6s.; 125 varieties, 15s.; 50 varieties, 35s.

Six Acres of Fruit Trees. Best croppers, well rooted, healthy trees. APPLES, PEARS, PLUMS, and CHERRIES, Pyramids, 9s. and 12s. per dozen; Standards, 9s., 12s., and 18s. per dozen; dwarf-raised, 18s., 21s., and 24s. per dozen.

CURRANTS and GOOSEBERRIES, 2s. 6d. to 4s. per dozen 12s. to 20s. per 100.

RASPBERRIES, 1s. to 2s. per dozen; 6s. to 12s. per 100.

RHUBARB, 4s. to 6s. per dozen; CATALOGUES free.

STRAWBERRIES, 1s. of the best varieties, compound plants, 2s. 6d. per 100; 10 2 1/2 inch pots, 10s. 6d. per 100; in 5 inch pots, for forcing, 25s. per 100.

VINES, 10 leading varieties on sale, good Planting Canes, 3s. to 5s. each; Fruiting Canes, 6s. to 7s. 6d. each.

Three Acres of Roses. Well rooted, hardy plants of best sorts; 12 fine H.-P. ROSES, 1s. 6d. for 7s.; 50 for 25s.; 100 for 40s.

MOSES, CLIMBERS, NOISETTES, &c., 6s. per dozen. CATALOGUES free.

Forest Trees. Evergreen and Deciduous Shrubs, Conifers, &c.

Many thousands of these in all sizes and varieties, and in the most healthy and well rooted condition. See Catalogue.

FOREST TREES of sorts, 6s. per dozen; 40s. per 100. EVERGREEN SHRUBS, 6s. to 9s. per dozen; 40s. and 60s. per 100.

DECIDUOUS, all beautiful blooming kinds, 4s. per dozen 25s. per 100.

RHOODODENDRONS, fine named scabring, piuk, crimson, &c., shades, 18s. and 24s. per dozen.

PRIVET OVALIFOLIUM, for hedges, 2s. per 100; 45s. per 1000.

THORN QUICKS, 20s. and 25s. per 1000.

Everything wanted for a Garden in the best quality at low prices. Large buyers liberally treated. See Catalogue.

THE "JOURNAL OF HORTICULTURE,"

COTTAGE GARDENER AND HOME FARMER.

CONDUCTED BY ROBERT HOGG, LL.D., F.L.S.,

Assisted by a staff of the Best Writers on Practical Gardening, and numerous Amateur and Professional Writers eminent in the various Departments of Horticulture and other Rural Pursuits connected with the Household.

It has been established for a period of nearly FORTY YEARS, and has long been regarded as the LEADING JOURNAL OF PRACTICAL HORTICULTURE.

This widely circulating Journal consists of Thirty-two pages of Letterpress, with occasional Supplements, and is richly illustrated with Wood Engravings in the highest style of the Art.

The JOURNAL OF HORTICULTURE contains the Earliest Reports of all the Important Horticultural and other Shows, GARDENING in all its aspects is treated exhaustively by the most practical and successful Cultivators of the day.

HOME FARM.—This Department contains sound and seasonable advice on Profitable Cropping, Stock Management, Manures and their Application, and the most approved Modes of Dairy Farming.

BEEES.—The most advanced Apiarists and the most successful Bee-keepers in Great Britain are contributors to this section of this long established and increasingly popular publication.

A NEW VOLUME COMMENCES THE FIRST WEEK IN JANUARY.

Published Weekly, Price 3d., post-free 3ld.

TERMS OF SUBSCRIPTION:—One Quarter, 3s. 9d.; Half Year, 7s. 6d.; One Year, 15s.

Post-office Orders to be made payable to EDWARD H. MAY,

OFFICE:—171, FLEET STREET, LONDON, E.C.

To be had of all Booksellers and Railway Booksellers.

LADIES and GENTLEMEN waited upon by appointment in any part of the kingdom,

NEAL'S RUNNER BEAN

"NE PLUS ULTRA,"

the best for exhibition or main crop.

MR. NEAL'S stock, harvested in 1886, is again placed in H. DEVERILL'S hands for distribution, and is only to be obtained true in DEVERILL'S Sealed Packets, direct from Banbury, or from those Houses who offer it in DEVERILL'S packets.

Per Packet, 1s., Post-free

This unequalled Runner Bean is the result of twenty years' selection by Mr. G. NEAL, of Bampton. It is worthy of a place in every garden. If the Beans in a Shilling Packet are planted a foot or so apart in the rows, the produce will be more than the yield of a pint of the ordinary kinds; thus a saving in time, labour, ground, and expense is effected. For earliness, productiveness, and quality, it has no equal, and the pods, which are straight, and of magnificent form, grow quickly to a length of 10 to 14 inches, free from strings, and of excellent quality. During the seasons of 1885 and 1886 it was awarded nearly Thirty First Prizes.

PROOFS OF SUPERIORITY IN THE YEAR 1886.

Gardeners' Chronicle, August 23.

"COTTAGERS AND ARTISANS' SHOW, ROYAL HORTICULTURAL SOCIETY'S SHOW, SOUTH KENSINGTON.—RUNNER BEANS.—This was the best filled class, of which there were 15 dishes; a splendid dish of 'Ne Plus Ultra' being first."

Mr. MILLER, Road Aton Gardens.

"'Ne Plus Ultra' Runner Bean is unsurpassed as an exhibition variety, and being so prolific must prove invaluable for market purposes."

Mr. HUGHES, Eydon Hall Gardens.

"I consider 'Ne Plus Ultra' the best in cultivation, a very free setter, pods long and straight."

Mr. MITCHELL, Eskrick Park Garden.

"This year I grew 'Girford Giant,' and 'Ne Plus Ultra' Runners; the latter is decidedly the best."

Mr. LYS, Sydmore Court Gardens.

"'Ne Plus Ultra' is the finest Runner Bean ever sent out, both for cropping and exhibition qualities; this season I grew them 14 inches long, and not a bit old, but quite fit for cooking. Every one should grow it who has a garden."

Mr. HOPE, Middleton Park Gardens.

"If any one has any doubt as to 'Ne Plus Ultra' being a valuable novelty, I would strongly advise a trial of it; grown side by side of other improved Runner Beans here this year, none could come up to it. The wires ran 10 feet high, and were loaded with Beans of a beautiful quality. I never saw anything like it, and in future I intend growing no other."

Mr. WINGROVE, Rousham Park Gardens.

"I have been enabled to gather a bushel of 'Ne Plus Ultra' Beans where I could only gather 1 bushel of the same number of rows of other 'Ne Plus Ultra.' It is highly adapted for kitchen or the exhibition table. Keep your stock pure, and I have no doubt that when the value of this Runner Bean is known it will be the Bean of the future."

Mr. DOHERTY, Wootton Abbey Gardens.

"'Ne Plus Ultra' is an extraordinary cropper, and of excellent quality."

Oxford Chronicle, August 28.

"Witney Show.—Kidney Beans.—'Ne Plus Ultra,' level as a foot-rule, were met with in each division."

Mr. SMITH, The Grange, Bampton.

"I planted 24 Beans of the 'Ne Plus Ultra,' which yield sufficient for the requirements of a family of five from the middle of July, to early October. I also took the First Prize at the Oxford July Show."

For further proofs, as also valuable Prizes offered in 1887, send for SEED CATALOGUE, now ready, gratis, and Post-free.

H. DEVERILL,
ROYAL SEED STORES,
BANBURY.

CHARLES SHARPE & CO.'S SPECIALTIES, 1886-7.

SHARPE'S QUEEN.
A grand Blue Marrow; height 2 feet. Pods large, deep green, and packed with large, deep green, deliciously flavoured Peas. The best Pea ever sent out, and so continuous a cropper! at a constant supply may be maintained by it alone, after the first crop is ready.
2s. per 1 pt. pkt.

SHARPE'S SIR F. A. MILBANK.
A magnificent, large, Blue Wrinkled Marrow. Peas extra large—deep green. Very hardy.
2s. per 1 pt. pkt.

SHARPE'S TRIUMPH.
A fine Dwarf Blue Wrinkled Marrow, fine flavoured and heavy cropper—sixty-nine Pods, with nine to eleven Peas in each, gathered from one plant.
2s. 6d. per pint

SHARPE'S PARAGON.
Hardest and most large Wrinkled Marrow. Successive crops can be had for four months.
First-class Certificate H.H.S., 1884.
1s. 6d. per pint.

SHARPE'S PROLIFIC WHITE MARROW.
An excellent, large-podded, prolific White Wrinkled Marrow.
1s. 6d. per quart

SHARPE'S INVINCIBLE.
Fine, long-podded, Blue Marrow. Peas deep green. A fine Market Garden Pea.
1s. per quart.

SHARPE'S CONQUEROR.
The longest-podded variety known. Pods extend to 15 inches long. Fine for Exhibition.
1s. per pint.

SHARPE'S EPICUREAN.
The most prolific, earliest, deepest in colour, and finest in flavour of any variety grown. Fruit long and very handsome. It is simply perfection.
2s. per packet

SHARPE'S VICTOR.
The earliest, quickest, and most productive kind of forcing or early planting—ready for table in from six to eight weeks.
6d. per pound.

SHARPE'S DUKE OF ALBANY.
Most valuable main crop variety—good to use from July to March.
3s. per stone.

SHARPE'S ST. VINCENT.
Scarlet-Bush; large roundish oval. Skin light orange, very much netted. Flesh of great thickness, rich, melting, and of a most delicious flavour. The plant is a strong robust grower, free-setter, and early.
2s. 6d. per pkt

SHARPE'S SELECTED WINTER.
An improvement upon Osborn's. Dwarf, with firm, pure white heads. Ready for use from the middle of November forward.
1s. per packet.

SHARPE'S EMPEROR.
The finest of the glossy-leaved varieties used for bedding. Leaves metallic in appearance and very deep in colour. The root is deep red, without tinge, and very rich in flavour.
1s. per packet.

SHARPE'S ECLIPSE.
A remarkably prolific variety. Fruit globular, smooth, growing in large clusters at every joint, exquisite flavour, colour bright cherry red.
1s. per packet

SHARPE'S LINCOLN GREEN.
The perfection of garnishing Parsley.
6d. per packet

SHARPE'S PRIZE WHITE SPANISH ONION.
The best type of the Banbury section of Onions.
1s. per packet

SATURDAY, DECEMBER 25, 1886.

CHRISTMAS BOUQUETS.

"THE old order changeth to the new" may well say the visitor to Messrs. Hooper & Co.'s show room under the Piazza in Covent Garden Market. Here are bouquets, &c., of various sizes and patterns, but as distinct in character compared with that prevailed a few years ago as can be—new agents, new styles, new developments, are the prevailing characteristics. In the matter of dried flowers, leaves and grasses, we have undoubtedly become much more aesthetic. Gone to a large extent are the old strong blues, striking crimsons, and vivid greens; they are replaced by softer and more tender hues—old gold, pale mauves, delicate browns, and silvery hues in abundance, have taken their place. In Paris, where the trade in dried and dyed flowers, &c., may be said to have reached its highest development, a little colour is still necessary, but in London, gold and silver, brown and white, with soft tints thrown in, are most appreciated; and there is a change in the subject too—many of the old ones are abandoned, and newer ones have taken their places. Even in this department of horticultural enterprise novelties must be sought for, but no old subject is abandoned until the character and fitness of the new are established beyond doubt; and the development of the trade in these subjects has become so enlarged that Messrs. Hooper & Co. now have two establishments in Paris, one in Germany, and one also in Hungary, and agencies in all parts where it is likely suitable subjects can be obtained.

It has just been remarked that a greater variety of subjects is one of the gains of the past few years. Among them may be mentioned a curious Thistle head from Africa, with a spiny involucre of good size, mounted with a charming delicate sea-weed from the Gulf of Florida, quite unique, and largely used. Then there are several unique Cape grasses, all of a beautiful character, specially collected for Messrs. Hooper & Co., brown in colour, but of various shades, and extremely useful in bouquets. Sprays of the Butcher's Broom (*Ruscus*), bleached in Germany, and of a delightful clear pale silvery hue, are also used in the larger bouquets, and have a very pleasing effect. Then there is an Echinops that comes from abroad, of almost similar character to the blue Thistle of our gardens, that is very useful also. But one of the most novel and at the same time most charming introductions, is what looks like a large and symmetrical silvery Scabious, formed of a seed-pod of an *Asclepias*, which produces a developed seed-head of a similar character to the Dandelion; the points of the hairy-like tubes are drawn together and tied, and when pulled away from the seed-pod assume this Scabious-like character; they are actually reversed, and when mounted are most attractive,

A Sorghum, with its millet-like heads, is also well worthy of notice.

Dried Palm leaves are being largely used for the backgrounds of bouquets: they come from Egypt, the leaves being blanched in the sun, and so perfect is the process that they retain their colour admirably. Various species of the genus *Phoenix* are used for this purpose, and especially *dactylifera* and *rupicola*; the Fan Palms also, especially *Lantana* and *Thrinax*. The fronds from small plants are equally of service, and the *Geonomas* are also employed in the same way. The waste leaflets of *Phoenix*, and especially of *P. rupicola*, are curled, then mounted, and employed with excellent effect. *Uniola paniculata*, a very tall water-grass from the marshes of Florida, is a comparatively new-comer of decided value, and the male flowers of *Zea*, as they issue from the pod, are dried and utilised. *Promus brizæformis* is such a useful agent in combinations that it is used by the ton.

The new "Makart" Fan bouquets are designed for the mantel-shelf or side-table, and they vary in size—some are 3 feet in height, others smaller. As a matter of course they face to a front, and for entrance halls, corridors, and such places they are of the greatest value. Here, in combination, may be seen the grasses and Palms of the tropics, combined with plumes of the Pampas grass. Some are more brightly coloured than others, to suit varying tastes; in some a few peacock feathers give brilliant hues not to be found in amongst dried grasses, but used sparingly; in others the skins and plumage of birds give variety of tint. Here is what may be termed a "love-gift"; it is an ornament standing a little over 2 feet in height; on one side is a bouquet of dried flowers, on the other there is an oval mirror in the centre, with a rustic tray and shell at the base. Above the mirror a white pigeon, bearing a gift—and what a pretty and novel Christmas present it makes! But this is only one of many elegant devices.

Artificial plants may be said to have had their day, and if found anywhere it will be only in dining-rooms, restaurants, and such-like places. In the change from the old order to the new, things purely artificial have given way to those of a natural character. The only exception to this is afforded by the beautiful wreaths, bouquets, crosses, &c., in china, manufactured in Messrs. Hooper & Co.'s Paris establishment. As many as thirty persons are employed in constructing flowers and foliage from the celebrated Limoges clay. It is of a grey colour, and by the deft hands of girls it is kneaded to the consistency of paste, then stamped according to the pattern required, baked, and coloured by artists specially employed on this work, both in London and Paris. The closest fidelity to Nature is observed in the artificial rendering of flowers and foliage. One charming wreath of Tea Roses and blue Forget-me-Not was worthy of all praise.

The old coloured grasses, *Gnaphalium*, &c., representing the commoner type of dried flowers, are still largely employed, in the northern districts especially. They give many a workman's home with grateful colouring at the Christmas season. They sell in abundance in the markets and seed shops.

Gaudy colours will always have their attraction for the masses, and if they can be made to relieve the gloom of humble homes, even if the degree of art they display be of the lowliest character, they should not be despised, for they are assuredly doing good service. *R. D.*

PAISLEY HORTICULTURAL SOCIETY.—The dates of the shows intended to be held by this Society in the forthcoming year are March 31, April 1, and September 1 and 2.

WHEAT IN PREHISTORIC TIMES.

OF late considerable attention has been directed to Wheat—on the one hand owing to the experiments of Messrs. Carter, and on the other by the remarks of Mr. Carruthers at the last meeting of the British Association at Birmingham. Messrs. Carter justly claim to have obtained great advances in the quality of Wheat, whilst Mr. Carruthers has said that "Wheat found in the purely British portion of the ancient village (Winklebary) explored by General Pitt-Rivers is equal to the average of Wheat cultivated in the present day."

Without making any attempt to support or question the views of any writer, the accompanying illustration of actual Wheat grains (fig. 156) will probably be regarded with some interest. The upper grains, A, are from Robenhause, in Switzerland, and belong to the polished stone age of that country. The bottom row, F, represents average Wheat as sold in the market place of Dunstable—a Wheat growing district. It will be seen that the stone age grains are very nearly equal in size to the average grains as now sold at

FIG. 156.—A TO F, PREHISTORIC WHEAT. G, WHEAT-GRAINS OF THE PRESENT DAY.

Dunstable. The second row is from a discovery made near Salisbury in June of the present year. Whilst some natives were digging ballast for a railway about 18 miles south of Salisbury a small quantity of Barley and Oats was found together with some three or four sacksful of charred Wheat in a hole which had probably been dug out as a ride granary. Blackened Wheat of the nature exhibited is often naturally carbonised by the action of the air; but in the Salisbury examples, furnished to me with particulars by Dr. H. P. Blackmore, of Salisbury, the Wheat had really been burnt, as was proved by the burnt condition of the sides of the rude pit or granary. The corn had been stored away unwinnowed, and was evidently a bearded Wheat, as was proved by the condition of a large quantity of broken chawed spikes. The position was one where quantities of Roman coins and Romano-British pottery had been previously found, and Dr. Blackmore considers the corn to date from the close of the first century. The Salisbury Wheat is much smaller in size than the Robenhause sample. In row c are grains from Winklebary, Wilts, fig. 3; these grains are considered by General Pitt-Rivers to be British; they are equal in size to the average Wheat of the present day, and it is only reason-

able to suppose that the British grains are smaller in size now than at the time of threshing. Rows D and E are also from Winklebary Pits 43 and 7; these are considered by General Pitt-Rivers to be Romano-British, and it is curious that they agree in their small size with the Romano-British examples from Salisbury. For the opportunity of illustrating the Winklebary grains I am indebted to Mr. Carruthers. In referring to the small Winklebary grains Mr. Carruthers says, "The two examples from the later Romano-British period are very much smaller" (than the truly British), although they are not unlike the small hard grains still cultivated on thin chalk soils. "I live in the immediate neighbourhood of a 'thin chalk soil,' and I have sometimes seen Wheat there growing quite as small as the Romano-British grains exhibited. In some positions near where I live the ploughing is extremely shallow; it appears to me to be little better than a mere raking of the soil. If deep, the chalk would absorb all the manure, but the ploughing being shallow the manure is kept to the immediate surface of the chalky ground.

Wheat is of very ancient culture in Britain, the oldest reference I know being that of Pytheas, the Greek merchant, in the fourth century before our era, who in his diary has described the abundance of Wheat and its threshing in covered barns in Kent.

In conclusion, I may perhaps be excused for suggesting the existence of a little exaggeration in some of the accounts descriptive of the amount of change wrought by man in the cultivation of Wheat since pre-historic times in the north of Europe. Most people are still far too credulous. As a great deal has been said about Egypt and its productions of late, and especially of the antiquity of man in that country, the works of Paleolithic man having probably been found there, I will conclude by mentioning a remarkable "mare's nest" quite recently discovered by H. Villiers Stuart, and published in his *Vile Gleanings*. In visiting the Lybian desert, Mr. Stuart, of course, met with the abundant fossil wood of that place. "I found," writes Mr. Villiers Stuart, "a fossil stick showing three very distinct cuts made with an axe of some kind, while the wood was still in its natural state."

The examples of Wheat illustrated are now in the Department of Botany, British Museum, South Kensington. *Worthington G. Smith, Dunstable.*

New Garden Plants.

BILLBERGIA CAPPEI = BREAU FEANA,
Hort. Morren.

THIS is a fine plant, distinct from a horticultural point of view, and now flowered at Kew. We bought it under this name last year from the collection of the late lamented Professor Morren. I cannot find any record of the name, but it is so exactly intermediate between two well-known species, *B. vittata* and *B. pallidescens*, *Bot. Mag.*, t. 6342 (B. Baker, Morren), that I strongly suspect it to be a garden hybrid. Can any of your readers state if such is really the case and place on record its history, for it is a type quite worth preserving as a garden plant?

Acaulescent. Leaves about ten in a rosette, lanceolate, rather horny in texture, narrowed gradually to an acute point, thinly white-lipidate on the glossy green face, copiously banded with white on the back, the central ones $1\frac{1}{2}$ –2 feet long, 2–2½ inches broad at the middle, the outer much smaller; marginal prickles minute, distant, erecto-patent, yellowish-green. Peduncle cernuous, 1 foot long; bracts lanceolate, bright crimson, 2–3 inches long, the three to four lower subtending the lower branches of the panicle. Panicle very lax; lower branches forked; proper bracts minute. Ovary cylindrical-trigonus, three-quarters of an inch long, pale green, faintly sulcate; sepals as long as the ovary, very pale green tipped with violet. Petals protruding an inch beyond the calyx, oblancoate-unguiculate, violet. Stamens about as long as the petals; anthers bright yellow, slightly versatile.—P.S. Since writing the above I find that B. Cappei is substantially identical with E. Breautiana André, figured in the *Revue Horticole*, 1885, p. 303, a cross between vittata and pallidescens made by M. Audré's Gardener, M. Breauté. *J. G. Baker.*

ANTHURIUM FUNCTATUM, *N. E. Brown, n. sp.*

This belongs to the same group as *A. Harrisii*, *A. Bakeri*, &c., and is about equal to the former as a decorative plant. It was introduced from Ecuador by Mr. Bull, and presented by him to the Royal Gardens, Kew, in 1879.

Stemless. Cataphyllary or scale-leaves 2-3 inches long, attenuate to an acute apex, soon becoming brown and fibrous. Petioles 6-8 inches long, 2-3 lines thick, somewhat compressed, rounded, or with an acute keel on the back; sometimes the keel is confined to the upper part, deeply and acutely channelled down the face, with acute edges to the channel; geniculus tumid, $\frac{1}{2}$ - $\frac{3}{4}$ of an inch long. Blade of the leaf 14-20 inches long, 2 $\frac{1}{2}$ -4 $\frac{1}{2}$ inches broad, in adult forms usually about 3 inches broad, elongate-oblong, cuneate at the base from about a quarter of the way up, apex rather abruptly acute or subobtusely, with a short mucro; bright dark green above, paler beneath, marked with very numerous blackish dots whence the name); midrib rounded above, acutely

(altius *Ceclandria*), no other species having to my knowledge such long bracts, which are nearly as long as the flower. But for this one might compare them to those of *Dendrobium cumulatum*, though they are smaller. Even the purple of the sepals and petals is similar to that of the just named species. I have at hand a fresh inflorescence on its stem and two dried wild inflorescences, which came over in the finest condition in alcohol. Messrs. Linden thought it was better to send these in a good state than to risk the ruin of the fragile contents of the bottle by pressing them into a box to save trouble to the packers. (I have at my side a number of glorious Orchids gathered by one of the most zealous collectors in a fresh district, and which are in the most abominable state, broken, crushed, pressed into boxes, after having been extracted from the bottles.)

Those inflorescences form capitate masses. The bracts are ligulate acuminate, purple-mauve at the base, green at the upper part. The basilar bract is blunt, and forms a transition to the presumptive scales. The sepals are triangular and keeled. The mentum

12 to 15 inches high, and covered profusely with large double flowers (fig. 157). The shape of the latter differs from that of all classes of *Asters* in cultivation, and resembles very closely that of a large-flowered Japanese *Chrysanthemum*. The petals are long and somewhat twisted or wavy and curled, recurved from the centre of the flower outwards in such a regular manner as to form a loose but still dense semi-globe. Well grown plants produce from twenty-five to thirty perfectly double flowers, measuring from 3 $\frac{1}{2}$ to 5 $\frac{1}{2}$ inches in diameter. The colour is a delicate pink bordered with white. This new section differs just as conspicuously from the other classes of *Asters* known and cultivated up to the present day, as the Japanese *Chrysanthemum* from the ordinary large-flowering varieties. The variety was raised by Messrs. Haage & Schmidt, of Erfurt.

WINTER FLOWERS AT TRING PARK.

IN the gardens of the Right Hon. Lord Rothschild, Mr. E. Hill, the gardener, seems to have attained perfection in the production of seasonable flowers, and more especially those which may be grown for winter flowering. It is always pleasant to make the tour of the gardens at Tring Park, the perfect neatness and order which prevail in it, from the Orchid-houses to the stove-houses, from the flower garden to the woodland drives, afford an excellent example of a thoroughly well-managed garden and its surroundings. At the present time the large span-roofed houses are gay with flowers, and much taste is displayed in their arrangement.

The houses of Carnations contain a large quantity of well-grown and profusely-flowered plants, which fill the air with their delightful perfume. After trying many varieties, Mr. Hill comes to the conclusion that for really efficient work the choice should fall on a few, and these generally the older kinds. In pursuance of this evidently correct idea the main crop now in flower and for succession are *La Belle*, pure white; *Irma*, rosy-carmine; *Lucifer*, brilliant scarlet; *Attila*, scarlet and white flake; *Andalusia*, yellow; *Miss Jolliffe*, bluish; and *Empress of Germany*, large white, with occasional red tip; these produce their flowers naturally in winter, and are much better than many of the new varieties, which are in many cases but summer-flowering garden kinds. A few of Cuelder's *Rose*, white; *Laura*, fringed pink; *C. A. Hooper*, yellow, with crimson edge, and some other kinds, are grown for the sake of variety, and for early summer flower many hundreds of superb plants of *Souvenir de la Malmaison*, which is always successfully managed here.

The zonal *Pelargoniums* also give a rich display, the single varieties, and chiefly of Cannell's *blazes*, being mostly grown. The whole house is a variety of colour, great trusses of every tint of crimson-scarlet, red, and pink being there in countless numbers. For winter flowering white, Cannell's *Eureka* is the only one found to come pure white, and it well shows its good qualities among the coloured varieties, of which *Placidi*, a large rosy-crimson; *Florence Durant*, crimson; *Henri Jacoby*, blood-red; *Dr. Rawson*, dark crimson; *Agnes Emily*, large white, with pink eye; *Glow*, salmon-orange; *Arthur Pearson*, bluish-crimson; *Celia*, large rosy-mauve; *W. B. Miller*, scarlet; *Alfred*, yellowish-scarlet, of *Vesuvius* habit; and *Circulator*, a fine reddish-pink, appear to be the best.

The house of *Cyclamens* contains plants which are individually and collectively as near perfection as possible; for size and colour of the flowers, and vigour and beauty of leaf nothing better could be desired; they are of Mr. Charles Turner's strain, and were sown in September, 1885. The plants are effectively set up with neat table plants of *Grevillea robusta* here and there among them, and a few well-flowered plants of *Bouvardias* at the back.

The houses of *Poinsettias* just expanding their showy scarlet heads are equally well arranged, the whole of the staging being filled with *Adiantum cuneatum*, among which the scarlet *Poinsettias* are arranged, the whole having a very pleasing effect. In other houses are some magnificent *Eucharis* and other flowers, and in the Orchid-houses the *Catambes*, *Sophrontes*, *Odontoglossums*, &c., are effectively in flower; while the two large houses of *Cattleyas*, and the house of *Phalenopsis*—both of which are cultivated to the very highest point of excellence at Tring Park—are heavily cropped with flower-spikes and buds.

FIG. 157.—COMET ASTER.

keeled beneath; primary lateral veins sixteen to twenty on each side of the midrib, slender, straight, all united to the intramarginal vein, which is one-quarter to one-third of an inch from the margin; peduncle 12-18 inches long, terete, green or reddish; spathe spreading or reflexed, 3 $\frac{1}{2}$ -4 $\frac{1}{2}$ inches long, seven lines broad, linear-oblong, cuspidate acuminate, with reflexed or revolute margins, reddish above, green beneath, becoming greyish-green or pale purplish-green with age; spadix a little tapering, 7-9 inches long (probably ranging from 6-8 inches), four lines thick, green when young, changing at the time of flowering to a peculiar brownish olive-green, and finally becoming dark olive-green. A native of Ecuador. *N. E. Brown, Herbarium, Kew.*

DENDROBIUM (PEDILIONUM) ERACTEOSUM, *nov. sp.*

This is a new Papuan introduction of Messrs. Linden. It constitutes a new section of *Pedilionum*

is about three-fifths of the length of the free parts of the lateral sepals, rather blunt, and contracted before the apex. Petals narrower. Lip nearly spatulate, a little convex on the upper sides, much thicker at the base, where the thick part is abruptly limited by an insistent triangle, greenish-yellow, changing to yellow at last on my table, bordered with some reddish tints at the anterior margins. Column green. There are as many as thirty flowers in the capitate mass in the wild specimens. *H. G. Rehb. f.*

CONTINENTAL NOVELTIES.

ASTER COMET.—This represents a new and beautiful section, of the same height and habit as the Dwarf *Paeony Perfection Asters*, forming fine, regular pyramids

densifloris multifloris caputatis; bracteis ligulatis acutis ovaria pedicellata bene superantibus; sepalis triangulari, lateralibus in mentum obtusum nunc apice libero paulo contractum extensis, omnibus supra nervum medium carinatis; tepalis ligulatis acutis, lobello ligulato poudarato demum signo angulato retroraso ante basin incrassatum; columnae apice trifida, lobis media linearis, laciniis lateralibus retusis hinc minime disto disto s. pollinis atrovivideis. *H. G. Rehb. f.*

* *Dendrobium (Pedilionum) tractosum*, n. sp.—Caulis teretibus (ad articulos, subincrassatus, an semper?); racemus

MARKET PLANTS.

CYCLAMENS AT TWICKENHAM.—What has been written of the *Chrysanthemum* may, in a somewhat modified form, be applied to the *Cyclamen*. Their beauty is all the more appreciated because they come to us as the last "sheaf" of a whole year's flower harvest. This flower is well grown by Mr. R. Clarke, Pope's Grove, Twickenham; and apart from the interest attaching to the flowers grown there, the place itself must ever possess attractions for admirers of the great poet, Pope. The ground now covered with glass structures was once the kitchen garden attached to Pope's Villa, and forming an object of peculiar interest is a grotto, where, in all likelihood, the poet received, "far from the madding crowd," his glowing inspirations. Close by is Strawberry Hill, once the residence of the Countess Waldegrave, and where so many brilliant parties took place in the "good old days."

A general idea of the extent of the culture of these beautiful flowers by Mr. Clarke may be gleaned from the fact that nearly 900 feet of glass are devoted to them. They are to be seen in all stages of development—from seedlings showing their first leaves through the soil, to plants one, two, three, four, and five years old. Rather than give a full description of them I would prefer to single out for special notice a few deserving sorts.

We may well begin with one named Albert Victor, which has very dark reddish-crimson coloured flowers—perhaps one of the richest ever produced; leaves prettily marbled, plant of vigorous habit. There was one plant especially of this variety that arrested my attention; it was in a 24-sized pot, and gave the idea of a perfect specimen of culture, and a very Anak amongst its kind, clothed with flowers, which were set off to advantage by the healthy foliage. A seedling from Albert Victor was very noticeable; its flowers of that colour which may be fairly classed as indescribable, of a rich velvety texture. Brilliant, a distinct variety of the persicum type; flowers of an intensely brilliant crimson colour, deepening at the base to dark blood-red, forming a pretty and effective contrast. Giganteum album, as its name implies, of the giganteum section; a plant of compact habit, the flower stem well thrown up above the foliage, and a profusion of pure white blossoms of great substance. It may be mentioned, in passing, that the Twickenham collection is particularly strong in good whites. Rosy Morn, a fine flower, deep rose, flushed faint purple. Sunrise, of a beautiful light purplish hue.

Mr. Clarke is not only a successful *Cyclamen* grower, he "goes in" largely for forcing *Strawberries*. For this purpose, he states, there is none better than the old Sir Charles Napier. As evidence of the appreciation in which this particular variety is held at Twickenham on account of its fetching a good price—an infallible test—it may be mentioned that from 12,000 to 14,000 plants of it are forced annually. It may be of interest to put on record here that "Napier," as it is popularly called amongst the growers and dealers, owes its birthplace to Twickenham, having been raised in the grounds of a Mr. Smith, a noted *Strawberry* grower in the picturesque Surrey village. B.

THE BULB GARDEN.

DOES NARCISSUS VIRIDIFLORUS PRODUCE LEAVES?

At a meeting of the Royal Horticultural Society at South Kensington on December 7 Mr. G. Maw expressed an opinion that *N. viridiflorus* produces no true leaves. Some of the strongest of my bulbs after flowering send up from the crown additional growths of smaller size than the flower-scapes, which I have hitherto taken for leaves, and in spring, when their growth is completed, I shall send some to Mr. Maw for examination. Being unable to work with a microscope I cannot assert that these leaves have any different structure from the flower-scapes. In outline they are similar—quite cylindrical. About this time last year I drew attention to this in a note to the *Gardeners' Chronicle*, remarking that this *N. viridiflorus* was the only *Narcissus* I had seen which was truly *Rush-leaved*. Next to it come *N. serotinus* and *N. elegans*, and then *N. jonquilla*, whilst the typical "Rush-leaved" (*N. juncifolius*) has flatter leaves than any of the section except perhaps the white forms of *N.*

trianthus from Oporto. *C. Wolly Dot*, *Ventnor*, Dec. 11.

The question raised by the Rev. C. Wolly Dod is one of some interest. In their leaf-producing aspect autumn-flowering bulbous plants are separable into two distinct sections, those that produce leaves contemporaneously with the flowers, and those, as in the autumnal *Colchicums*, and ten or eleven species of autumn-flowering *Crocus*, in which the leaves are dormant at the flowering-time, and are not produced till the ensuing spring. I take exception to the term "Rush-leaved" as applied to a group of *Narcissi*, because it brings together a number of species which have obviously little natural affinity, and not one of the species in the so-called group have cylindrical leaves, or leaf-like organs, excepting *Narcissus viridiflorus* and *N. serotinus*, and these I contend are not true leaves. If *Narcissus viridiflorus* produces leaves, to which of the above sections does it belong? Are the leaves contemporaneous, or do they form a distinct and subsequent growth in the spring? I have seen many hundreds of *N. viridiflorus* and of *N. serotinus* in the wild state, and have also flowered them in cultivation, but have never observed a leaf-like organ produced from the same points of growth as the scape, nor have I observed after three years' cultivation of *Narcissus viridiflorus* a second growth, commencing after the autumnal growth. My pots of *N. viridiflorus* are full of *Rush-like* growths and flowering-scapes, but they all appeared together, or in rapid succession, and in no case can I detect that a "leaf" and scape are produced from the same axis of growth; and I contend, therefore, that the leaf-like growths are merely small scapes that are not strong enough to produce flowers. *George Maw, F.L.S., Benthall, Kenley, Surrey.*

NARCISSUS PANIZIANUS IN PORTUGAL.

I have just been favoured by Mr. A. W. Tait with fresh specimens of this species flowered in his garden at Oporto from roots collected last February in the province of Algarve, South Portugal. Mr. Tait's specimens exactly match those shown in Panizzi's photograph of the species from San Remo, and I am not aware that it has been previously recorded from Portugal. It is notably a smaller species than the nearly allied *N. papyraceus*, from the Riviera, Gibraltar, and Northern Morocco. I believe some of the *Narcissus* cultivated under the name of Paper White to be *Narcissus Panizianus*, while others belong to *N. papyraceus*; *N. Panizianus* is not nearly so large and ornamental as the beautiful white *Narcissus papyraceus*, Gawl. = *N. niveus*, Lois, which grows so abundantly on the Rock of Gibraltar. Good figures of both species are to be found in Moggridge's *Flora of Mentone and the Riviera*. *George Maw, F.L.S.*

ON THE FLORA OF ICELAND.

(Continued from p. 704.)

PLANTS useful to the natives in one way or the other are:—

Angelica archangelica, L., is used as food; the root is daily used as such in times of scarcity, or when other food is difficult to be had, especially in spring; in autumn the natives gather the roots, and preserve them in sand, or they are kept under the earth at a sufficient depth to be out of reach of the frost. They are eaten with butter, as all other food, and also the roots of *Silene acaulis*, L., and *Statice Armeria*, L. Sometimes they are dug up in spring and eaten either raw or boiled in milk.

Lichen islandicus, L., the Icelandic moss, is collected in autumn for winter use; it is also boiled with milk, and is then a very nutritious food. This moss is also used to dye woolen clothes by the people of the Borgarfjord; this is done in the following manner:—They put some of the moss in the cloth intended to be dyed, to which it readily attaches itself; the piece of clothing is then wound on a wooden cylinder, and the whole boiled in an iron pot for six hours; afterwards it is taken out of the water, unwound, and dried; the colour thus acquired is a dark but excellent yellow.

Dryas octopetala, L., and the leaves of this plant are used as tea.

Eriophorum poly-stachyum, L.; the pappus of this species is used for wicks.

Hoteus lanatus, L., is used as a perfume for clothes and rooms; it is burned for this purpose.

Of the different species of *Rumex*, the leaves are eaten in the same way as on the continent.

Arenaria peploides, L., is first put in sour milk; then the latter is poured off and fresh water added; this beverage is then drunk by the natives with some olive oil.

Of *Potentilla Anserina*, L., the root is often eaten, especially in the southern part of the country.

Thymus Serpyllum, L., is used to give the sour milk an agreeable flavour.

Of *Achillea Millefolium*, L., a salve is made with butter for wounds.

Zistera marina, L., is eaten by the cattle; it is also used for filling beds.

Cyberis herbarica; of this plant and of some species of Willow, the hairs of the fruits are used for covering wounds; of the wood ink is made, by putting it in a decoction of the leaves.

The different species of *Equisetum* are also used as food for cattle and horses, as is the case in Siberia.

Lichens represented by but few species; especially those growing on trees are rare. This is explained by the latter being found in very few specimens on the island; even those growing on rocks are not at all plentiful because the lava does not favour the vegetation of these plants.

Of mosses, some rare or new species are found in Iceland; many species of the genus *Jungermannia* are indigenous to the island, yet the moss flora of Greenland, Spitzbergen, and Lapland is relatively rich in species compared with that of Iceland. Of 279 Icelandic species, 215 are also found in the countries just named.

The coasts of the island are exposed to a very heavy swell, hence of Algae there are only a few of the coarse species to be found; the others cannot grow on the rocky soil under such circumstances.

Of Fungi there occur very few species, and these are of no importance to the natives.

The cultivation of corn (Oats, Barley, and Wheat) has never led to any result; yet the culture was carried on in former times on a large scale because nothing was imported. Of the Barley rice seeds can be gathered when the summer is very favourable, but culture on a large scale is too uncertain.

Of Potatoes the first were cultivated in 1758, and notwithstanding the culture is not very profitable, it is carried on to a larger scale than before.

The grass is the principal plant for the Icelandic agriculture. Of *Elymus arenarius*, L., the seeds are used in the same way as those of the Wheat on the continent. The plant is named Melur.

The grass vegetation is better in the northern than in the southern parts of the island; this may be regarded as very remarkable, taking the great difference in climate into consideration; but the snow shelters it from the frost to a greater degree than is the case in the north. The harvest begins in July, when the grass has reached its greatest size, and lasts till the end of September. *Elymus arenarius*, L., is cut in August.

The growth is very rapid when the snow melts, and very often the young plants appear out of the snow itself when there is sufficient sunshine in spring. In the latter season it is, in the first place, the east wind that prevents growth by its severe cold, the quantity of salt which it carries from the Atlantic Ocean to the island, and which is often deposited as crystals on the window panes of the houses.

The whole area of meadow land where hay is harvested is about 100 square miles; other grass-land, of less good quality, comprises about 800 square miles. The soil is not ploughed or sown, but everything is left to be done by Nature itself, there being no materials for that purpose on the island. No doubt many of the lands now lying waste could be changed into excellent meadows were the necessary means at hand.

Many of the houses at Reykjavik have small gardens, where Cabbages, Turnips, and Potatoes, sometimes also Carrots, are cultivated; the Turnips are of common size, and also the Potatoes; Radishes grow very good, and are to be had in July and August; Mustard and Cress do very well, and are used as vegetables; Flax and Hemp were sown, but with no result.

All possible means have been tried to cultivate trees on the island, but the attempts have universally failed even with the most hardy species.

The following plants are cultivated in a few places:—*Atriplex horneana*, L.; *Origanum Majorana*, L.; *Lactuca sativa*, *Petroselinum sativum*, Hoffm.; *Apium graveolens*, L.; *Pisum sativum*, L.; *Cher-*

anthus Cheiri, L.; Lupinus luteus, L.; Lavatera trimestris, L.; Ribes nigrum, L.; Nigella damascena, L.

The whole flora (Phanerogamæ and Cryptogamæ vasculares) consists, according to Strömfelt, of 371 species, when all doubtful ones are omitted; a small number for such an area as that of Iceland.

Many tropical fruits, as those of *Mimosa scandens*, L.; *Piscidia Erythrina*, L.; *Cocos nucifera*, L.; *Cucurbita Lageneria*, L.; *Cassia Fistula*, L.; and *Anacardium occidentale*, L., are often found washed on the shores by the warm north-east current originating from Tropical America; they are also seen on the shores of Scotland, the Færöes, and Norway, but in the latter country never south of 62° 20' N. lat.

The fossil flora of the miocene period consists, according to Heer, of thirty-seven species; the principal are:—*Araucarites Sternbergi*, Gopp; *Pinus thalensis Steers*, P. Martini, Heer; *P. microseperma*, Heer; *P. æmula*, Heer; *P. Stenstrupiana*, Heer; *P. Ingol-fiana*, Steenstr.; *Betula macrophylla*, Gp.; *B. prisca*, Ltt.; *B. Forchhammeri*, Heer; *Alnus Kefersteini*, Gp.; *Salix macrophylla*, Heer; *Corylus grossedentata*, Heer; *Quercus Olafseni*, Gp.; *Platanus aceroides*, Gp.; *Acer otopteroid*, Gp.; *Vitis islandica*, Heer; *Liriodendron proceroides*, Ung.

The character of the whole fossil flora is decidedly North American, while that of the present flora is European; but the miocene flora of Europe was also that of North America. Of thirty-one fossil species found in Iceland, fifteen are also discovered in Europe, and of these thirteen were trees very common on the island. Thus the European flora reached with thirteen species up to Iceland; tropical flora are not found. The genera *Liriodendron*, *Juglans*, *Vitis*, and *Araucarites* are the most southern types.

The fossil flora of Iceland must have required for its existence a mean annual temperature of about 52°, while the present is only 32°; yet some of the species would also vegetate by a mean 7° higher than the mean of Reikiavik.

The decidedly poor flora of Iceland proves that a real sea climate under such a high latitude is very disadvantageous to vegetation in general, while it is the best for southern latitudes. The difference between the Siberian and the Icelandic vegetation shows that when comparing these extremes of climate the continental has the advantage. *M. Euzsmann*.

Orchid Notes and Cleanings.

DENDROBIUM MACFARLANEI, *Rehbl. j. Gard. Chron.*, October 21, 1882, p. 520.

MR. J. O'BRIEN has kindly forwarded me a spray of flowers and a sketch of the stem of this very rare plant which had previously only been known to me from some dried flowers gathered by Mr. Macfarlane, and kindly sent me by Mr. Harry Veitch. I learn from Mr. J. O'Brien that it came from Mr. C. Heerford, of Chalfont Park Gardens, Slough. The bulb is stated by Mr. J. O'Brien to be exactly that of *Dendrobium Farmeri*. A fusiform, furrowed bulb exceeds the length of a middle-sized span. One leaf of oblong outline is sketched, one or more having fallen away before. There are vestiges of four racemose inflorescences. The flowers are quite excellent; they surpass those of *Dendrobium Phaleopsis*, and are as large as those of *Dendrobium formosum* Berkeleyi, though the inequality of the sepals and petals changes considerably the impression. Sepals triangular, with a blunt rectangular mentum, snow-white, with some little purple margin at the base; petals much longer, rhomboid, acuminate, snow-white, much longer. Lip nearly or quite as long as petals, trifid; side lacinie basilar, oblong, mid-lacinia cuneate oblong acute. A ligulate callus, broader at the base, furrowed in the middle, runs from the very base of the lip to the base of the mid-lacinia. The lip is white, with a purple area around the purple callus, and a big purple spot at the end of each side-lacinia. Column white, purple on both sides of ovary.

This *Dendroba*, in its chaste and glowing beauty, may one day be an object of the most ardent interest of those who understand the perhaps not very easy art of keeping *Dendroba* for a longer time. I believe the great question is to keep them at rest for a long while. *H. G. Rehbl. f.*

A NEW "BLUE" CATTLEYA.

Dr. John Duke, The Glen, Lewisham, has been so very kind as to send me a most remarkable flower of *Cattleya Loddigesii* which is nearly white, though not so white as that of Mr. Tautz. Sepals and petals bordered with fine rose and the lip too. The last mentioned part has the disc with a light wash of sulphur. Whether this is constant we must wait to know—I believe it.

Rolled around the stalked ovary appeared a piece of white paper with blue (genuine blue, lightest Prussian-blue) lines and two carmine borders. It is written on it (not by Dr. Duke):—"Sir, we are of the opinion that this is a blue colour." I should have thought the meaning was, that the lines were blue, and that this I should have had no objection; yet Dr. Duke tells me the flower is alluded to. As to me, I do not think the borders of the flowers are blue. But it is difficult to dispute about colours. Perhaps blue has another meaning in old England than with us. An excellent English lady showed me the other day a "blue" cat, which to my German eyes looked remarkably grey. *H. G. Rehbl. f.*

BOLLEA PULVINARIS.

This fine species has triangular flowers, nearly 4 inches across; segments ovate acute, lilac; lip convex, with very prominent yellow ridges. A moderately high temperature is required for its culture, and the plant should be grown in a basket with coarse peat and sphagnum. *Lindonia*, t. 61.

MILTONIA SPECTABILIS, var. LINEATA.

is an improvement on the type, the lip being of a delicate hue with nerves of a beautiful carmine. The Miltonias, says M. Linden, should be grown under full exposure to the sun when their pseudobulbs and leaves become yellowish. If kept in the shade the colour becomes green, but at the expense of the flowers. *Lindonia*, t. 62.

CYMBIDIUM GIGANTEUM.

A very fine variety of this is now in flower with Mr. F. W. Moore, at the Royal Botanic Gardens, Glasnevin, Dublin. The flowers, which are over 3 inches across, are borne fourteen or fifteen on a spike, and are very richly coloured, the broad labelum being very brightly blotched with reddish-chestnut on a pale yellow ground. *Cypripedium insigne* var. maculata, a very rare and beautiful variety, is also in bloom at Glasnevin. Its flowers are light in colour, and of the Maulai shape, a trace of that variety also appearing in a purple dot or two on the top sepal, which in other respects resembles the top sepal of *C. i. albo marginata*, but is much larger and flatter.

The Flower Garden.

WINTER-WORK.

SNOW should not be allowed to accumulate on the trees and shrubs, but steps taken to relieve them—if possible—from it as fast as it falls. Long poles should be used, and the snow-laden branches should be moved gently upwards and allowed to fall down, when the bulk will drop off. One man should go first with a long pole to ease the higher branches, while another should follow with a shorter one. The necessary quantity of flower stakes should be got in readiness for next year. The old stock should be gone over on wet days, and the decayed points should be resharpener. Where there is abundance of Hazel copse, there an ample stock of flower sticks can be obtained for the cutting. These should be secured when snow prevents other work from being carried on. They should be all trimmed, sized, and tied in bundles ready for use. A good assortment of wooden labels should also be made for use in due season, as also pegs for Verbeas, Petunias, &c.

HEDGE TRIMMINGS AND CHARRING SOIL.

The clipping of hedges may now be undertaken, as also the trimming of shrubs. The straggling shoots should only be shortened back. Avoid a stiff formal shape. All trimmings and dead wood should be made into faggots as they are cut; these, if kept in reserve, will serve to char the accumulated rubbish from the garden, or to burn the clay soils of flower-

beds. Remove two spades deep from the centre of such beds as it is deemed necessary to char, to a diameter of about 6 feet; then rear the faggots on end pyramid fashion, set fire to the pile, and keep building the soil removed around the mass, preventing it bursting into flame if possible. The idea is to keep it smouldering. As the red fire appears at the outer edge, keep adding more faggots and covering up with more soil until the whole of the soil in the bed will be one mass of charred material. This will have completely changed the character of the soil, and the most delicate rooting subjects will prosper, where formerly they could make no way at all. It also gets rid of all weeds, vermin, &c., and a fresh start is thus obtained. *William M. Patten, Luton, Herts.*

FRUITS UNDER GLASS.

CUTTING AND FOLLING GRAPES.

LATE Grapes should be cut next week with a good length of wood attached for inserting in bottles nearly filled with water, and having a few pieces of charcoal in each to keep the water sweet. The bottles should be allowed a sufficient angle on the shelves in the Grape-room to prevent the weight of the individual bunches from overbalancing them, and the space in the bottle around the shoot should be filled with cotton-wool to prevent evaporation. The bottles should be re-filled with water once or twice during the next four or five months, so that the end of the wood attached to the bunch of Grapes shall be in contact with the water.

PRUNING THE VINES.

I never observe any hard-and-fast line in carrying out this operation, but simply prune back to a good plump bud irrespective of its being the first or fourth one from the main stem; if the latter bud is selected the two immediately preceding it are cut clean away, leaving the bud close to the rod to make bearing wood for another year, the long spurs being cut hard back at pruning time next year, as should be done where any such are found on the Vines this year if found advisable. If the wounds are likely to bleed dress with Thomson's styptic. After thoroughly cleansing the house inside and out proceed to remove with the hand the loose bark on the Vines, and then wash them with a solution consisting of 4 oz. of soft-soap dissolved in a gallon of warm water and two hand-fuls of sulphur, well mixed, rubbing it well into the crevices round the spurs, &c., with a stiff brush, taking care, however, not to injure the buds in doing so.

THE BORDERS.

These should next have attention. The loose surface soil to the depth of a few inches—indeed, down to the roots—should be removed and replaced with a compost consisting of fibry loam, old mortar rubble, wood-ashes, and horse-droppings, at the rate of five cartloads of loam, one load of mortar rubble, and the same quantity of wood ashes and horse-droppings; and three or four barrowfuls of fresh soot, and three or four hundredweight of Thomson's Vine and plant manure, well mixed; following this with a surface-dressing of horse-droppings, and a good soaking of tepid water, as well as a liberal circulation of fresh air, until the time for starting the Vines in the respective houses arrives.

EARLY VINES.

Pot Vines and others early started should have all superfluous shoots rubbed off as soon as it can be seen which are best to be left on each Vine; and all the bunches showing on the individual laterals but one should be removed as they appear, leaving, as a matter of course, the best; and these, after the berries are set, should be reduced in number to, from seven to nine, according to the length and strength of each permanent Vine, and five bunches will be enough for each pot Vine to carry. As soon as the buds show signs of bursting, the night temperature should be raised to 55°; and 5° higher as soon as the bunches appear, and 5° more when they come into flower and until the berries are set, with a corresponding increase in the day temperature. The atmosphere in the house up to the time of the Grapes coming into flower should be moist rather than otherwise, and the reverse of this when the bunches are in flower, so as to secure a good set; and with this object in view, a camel-hair brush or a rabbit's tail tied on to a stick, should be passed over the bunches about mid-day until the berries are set, when they should be thinned, and a growing temperature be maintained. *H. W. Hensley, Longford Castle.*

Appointments for the Ensuing Week.

SALES.

WEDNESDAY, DEC. 29.	{ Sale of Hardy Plants and Bulbs, at Stevens' Rooms.
THURSDAY, DEC. 30.	{ Sale of Lilies imported from Japan, at Stevens' Rooms.
FRIDAY, DEC. 31.	{ Sale of Imported Orchids, at Pro- theroe & Morris' Rooms.
SATURDAY, JAN. 1.	{ Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

ANY one who turns over the pages of the gardening journals for the present year, or who indulges in a little retrospection, will see that the year now drawing to a close has been a particularly busy one. Nor will the retrospect prove anything but satisfactory. In spite of the dismal Jeremiahs of the LAUREATE, there has been real progress. Evolution, no doubt, has been accompanied by reversion; it must be so; but on the whole a real march forward has been made. We have not yet become stagnant in the cycle of Cathay, and we, as horticulturists—happier than the LAUREATE—can still look forward with confident hope to the future. We have had our cynical growls over rates and taxation, extraordinary tithes, allotments, depression of trade, and the miserable returns obtained by the growers and manufacturers of garden produce; but, then, we always have such little elements of bitterness in our cups, and we cannot think that, on the whole, the draught has been more unpleasant than usual. At any rate there has been no relaxation of work, and work of itself is a boon and is sure to tell in the long run. It is not for us to speak of the work of individuals, but collectively the work of the year has been great, and we cannot doubt its ultimate good result.

Alluding as we do in particular to public work, we have first in order to note the success of the Primula Conference. Specialisation is the order of the day, but it involves no new principles, but only an expansion of the old, and we may venture to say that the special action in this case has very materially aided the cause of Horticulture, and shown that the *cultus* of florists' flowers is by no means necessarily the narrow and restricted affair it is often made to be. Another proof of the same kind was afforded by the Potato Tercentenary, which was the last celebration of the kind for the year, and which, though badly managed and poorly attended, elicited a large amount of information of a very varied character. Between these two celebrations, if we may so call them, there was a host of others. Roses, Carnations, Dahlias, Chrysanthemums, Apples, Pears, Gooseberries, and Grapes, each had its gala day in the metropolis and endless commemorations elsewhere.

The most important of the whole was the great Provincial Exhibition at Liverpool—an admirable show, which excited keen interest among horticulturists, but which we are sorry and astonished to add was met with utter indifference by the Liverpool public. We cannot stay now to discuss how or why this was so; most of the conditions were favourable, not even excepting the weather; the political weather at the time was, however, stormy. Let us attribute the failure to that cause.

The great interest of the year, however, culminates in the magnificent Indo-Colonial Exhibition. It is impossible to over-estimate the importance of this to the country at large, and so far as our special subject was concerned, no finer display of the possibilities of plant-culture, forest-conservancy, and of the resources of the vegetable kingdom generally, has ever been got together. All this was palpable and tangible, and the lessons it conveyed must sink deeply into our minds. If

in some respects the display was discouraging as regards the British farmer and gardener, the boundless possibilities it opened in other directions ought to supply ample compensation.

Less strikingly apparent, but in their way equally important, are the slow and sure advances of science. Practical experience must ever be the most important factor in a practical art, but if that experience is to be utilised and turned to good account by improving old and opening up new methods, it must be by the aid of science. Accumulated experience is only simple addition—add to it the teachings of science, and it becomes multiplication; and more than this, science—that is, increased knowledge—opens up prospects which mere experience never could attain to or utilise. The steady increase of our knowledge of root-action, of the mode of life of Bacteria, on which the fertility of our soils depends; of the co-operation of fungi and other plants, may be cited as among the many cases where increased knowledge must inevitably tend to amelioration of practice, and greater economy of production. From this point of view the experiments made at Chiswick on the mode of growth of Potatoes under various circumstances, the experiments carried out with so much spirit by Messrs. SUTTON at Reading in the case of Potatoes, and by Messrs. CARTER in the case of Wheat, are encouraging for the future. When practical men thus see the desirability of adopting scientific methods in the conduct of their business the outlook is indeed hopeful, and as such may be commended to the attention of the cynical LAUREATE. Though less distinctly scientific, the experiments on Tobacco culture made by Messrs. CARTER and others are deserving of all commendation; for, even if they should ultimately prove unsatisfactory, they will at least emphasise the necessity of getting out of narrow routine, and prove useful by devising new methods to meet the exigencies of the times.

Conscious of the necessity for an enlarged education of our young gardeners, in order to enable them to compete on equal terms with their much better equipped brethren of the Continent, we offered some prizes, which were awarded at the Liverpool show by Sir TREVOR LAWRENCE, the President of the Royal Horticultural Society, and which, we are glad to say, elicited much attention on the part of young gardeners, and brought out some excellent papers.

Among new books relating to our subject, the *Lectures on Physiology* of Dr. VINES must necessarily hold a foremost place, though exclusively scientific. Mr. MAW'S *Monograph of Crocuses* is a first-rate illustration of what a monograph should be, and shows how manifold are the studies required in the investigation of so common a thing as a Crocus. Messrs. CASSELL'S *Popular Gardening* is noteworthy for containing not only the latest *resumé* of practical matter, but a general sketch of modern theoretical horticulture, such as is not to be found elsewhere. Mr. GILL'S *Dictionary of Gardening*, edited by Mr. NICHOLSON, may also be mentioned as within its limits by far the best and most reliable dictionary of garden plants yet published. Dr. MASTERS' *Vegetable Teratology* has been re-published in Germany, with large additions by the author and the editor, Herr DAMMER, so as to render its information as complete as possible. A similar remark may be made with reference to Dr. SORAUER'S *Treatise on Plant Diseases*.

At New Mr. MORRIS has been appointed Assistant Director, and by his zeal and energy the work done by this magnificent establishment may confidently be expected to be even more extended than it is now. Mr. NICHOLSON and Mr. WATSON jointly fill the post vacated by Mr. JOHN SMITH, whose retirement will be regretted by many who experienced his kindness.

The condition of the Royal Horticultural Society excites the gravest apprehensions among its adherents. The ordinary work of the year has indeed been carried on vigorously and well, but there is a thick cloud overhanging its affairs which we may hope the Council will soon be able to dispel, or at least let us know the worst.

The Gardeners' Benevolent is, on the other hand, prosperous, and effecting a great deal of good. It is impossible to mention this Institution without an allusion to the Secretary, Mr. CUTLER, who has made it what it is, and who may be trusted to develop its usefulness still further if backed up, as he should be, by the efforts of the gardening community.

The Obituary list of the year is not so long as in some years. The historian of British gardening, and so long connected with the *Journal of Horticulture* as one of its editors, has concluded a long life of honourable activity and marked usefulness. ZADOK STEVENS will be mourned as an excellent example of a first-class practical gardener, and CHARLES GREEN will long be remembered for his almost unique knowledge of plants and their culture. Horticulture generally has not of late years sustained so severe a loss as that occasioned by the death of the learned, the energetic, and genial EDWARD MORREN. Day after day as journalists we experience the magnitude of our loss and note the void made by the death of a man who, though so eminent and so useful, must have been personally unknown to the great majority of our readers. To our Belgian friends the loss must of course be more severe than to ourselves. We can only hope that in that prosperous little kingdom some one may be found in a measure to supply his place.

Of the New Plants of the year we hope to be able to speak on another occasion. This sketch—fragmentary and superficial as it is—may serve to show that horticulturists have reason to be well satisfied on the whole with the progress made in 1886, and with the promise of future development in 1887.

—OUR ALMANAC.—With this number we present our readers with a supplement in the form of a coloured almanac for the coming year, and which embodies as usual a large amount of information useful to the gardening fraternity. The daily mean temperature is that deduced from the records kept at Chiswick for so many years, and corrected by Mr. GLAISHER. It cannot, of course, be accepted as a certain indication of the temperature, but, at any rate, it shows the average results for about half a century. The body of the almanac contains a complete list of the most important metropolitan meetings and exhibitions as announced up to the present time. If the arrangements of many provincial and local societies are not included, it is because their schedules are not issued till late in the year. The meetings of the greatest importance to the horticultural public, such as those of the Royal Horticultural Society and the Royal Botanic Society, are all inserted, as well as those of the Linnean Society, the Chrysanthemum, Carnation, and Auricula Societies. As to the design, while we are afraid that the artist would not find favour with the florists, he at least deserves some credit for his arrangement of the flowers, which, in the matter of lightness and individuality and gradation of shadow sets a lesson to the bouquetists of Covent Garden. The design may furnish a hint to those of our readers who have to decorate corridors and similar large spaces, for which the large bowl, filled as in our design and raised on an elegant tripod, is well suited.

—POLYGONUM SACHALINENSE.—Docks and their allies, as a class, are not looked on with much favour in the garden, nevertheless there are some among them which, on account of their bold habit, brilliant flowers, or other qualities, are worthy inmates even of the most select garden. Among them is the subject of our illustration (fig. 158), first described by F. SCHMIDT, in his *Primitia Floræ Amurensis*, 1853, p. 233, and in our columns in 1870, p. 1599,

FIG. 158.—POLYGONUM SACHALINENSE: HARDY PERENNIAL, SHOWING THE SEED-VESSELS (SEE P. 812)

when first introduced into English gardens by Mr. W. BULL. In a wild state in the island of Sachalin, north of Japan, the plant exceeds the height of a man, and in this country it attains nearly as large proportions. It forms a ball-tuft of stout reddish slightly arching stems, with broad, ovate, acute leaves, 12—18 inches long, and a multitude of small greenish-white flowers, which are succeeded by the obovate winged seed cases, shown in our illustration. On its first introduction we commended it as suitable for shrubberies and waste places, but its massive statelyness of habit has since won it a place on the lawn as a specimen plant, than which few are more effective. It is, however, objectionable in such a situation, from its propensity to throw up suckers at a distance from the parent plant. It is perfectly hardy and the seeds might be useful in covers where game is preserved. There is a coloured figure and description of the plant by Sir JOSEPH HOOKER, in the *Botanical Magazine*, t. 6540

—“VEITCH'S MANUAL OF ORCHIDACEOUS PLANTS.”—This work, the early publication of which is announced, is uniform with the *Manual of Coniferae*, royal 8vo, and will be illustrated with maps and numerous engravings. The work contains descriptions of all the most important species and varieties cultivated under glass in Great Britain, with information concerning their origin, botanical history, date of introduction, together with cultural notes, &c. It is compiled to supply amateurs and cultivators of exotic Orchids with a fuller account of the principal genera, species, and varieties cultivated under glass than is contained in the manuals hitherto in use. The rapid extension of Orchid culture during the last quarter of a century, resulting from the increased taste for, and appreciation of, this beautiful and interesting order of plants, has, in Messrs. VEITCH'S opinion, created a demand which they are now attempting to supply. So numerous are the species and varieties of Orchids at present in cultivation, and to which additions are constantly being made by new discoveries and by artificial hybridisation, that the labour attending the compilation of a manual sufficiently comprehensive to meet the wants of cultivators must necessarily demand much time. Messrs. VEITCH have, therefore, decided upon issuing the work in parts, each part containing a monograph of the cultivated species and varieties of one of the most important genera, or of a group of genera. Part I., *Odontoglossum*, is now ready, and will be followed by Part II., *Cattleya* and *Lælia*; Part III., *Dendrobium*; Part IV., *Cypripedium*, &c.

—“THE GARDENERS' MAGAZINE.”—The Christmas number of our contemporary is looked for with eagerness, for, intermingling with the business-like records and solid information which are provided weekly, there is sure to be some fun and some paths provided for this special occasion. Grave and gay, poetical and prosaic, but never prosy, and with lots of pictures, those will indeed be difficult to please who do not find something to their taste in the Christmas number of the *Magazine*. “A Cool Market in the Snowy North” has a wonderful resemblance to Covent Garden.

—“SUTTON'S POCKET GARDEN CALENDAR FOR 1887” will be found a useful reminder to amateurs and others, who will not be distressed with the weight of the book, while they will have something of value in their pockets if this be included among their contents.

—“THE BOTANICAL MAGAZINE.”—The December number of this centenary publication contains figures of:—

Alpinia nutica, t. 6908.—A noble species, with lanceolate leaves, sheathing stalks, and spike-like cymes of flowers, the segments of which are of an ivory colour tipped with pink, the large lip being trowel-shaped, orange, with radiating red lines. It is a native of Borneo, and flowered at Kew.

Aristolochia elegans, t. 6909, and *Carpenteria californica*, t. 6911, have already been figured in our columns.

Geranium tuberosum, t. 6910.—This is the Afghan form of the species, and is here distinguished under the varietal name Charlesi. It has a singular necklace shaped rhizome, the joint of which are superposed one upon the other like beads in a necklace. The leaves are palmate, deeply divided into numerous narrow segments, and the flowers are borne in cymes, each of

the diameter of a sixpence, rosy-pink, with darker coloured veins.

Aster Stracheyi, t. 6912, has the habit, stolons and foliage of *Hieracium Piosella*, with erect flower-stalks terminated by a head of lilac-rayed flowers resembling those of *Erigeron mucronatum*, but with the florets rather less narrow. It is a native of the Western Himalayas, and flowered at Kew in 1885.

—“BRITISH ORCHIDS.”—Mr. A. D. WEBSTER has published a handy little volume on the structure and life-history of British Orchids, with special reference to their culture. It will be our duty to lay before our readers an account of the little volume, for the preparation of which Mr. WEBSTER has, as we know, had special facilities; but we must, in view of the extensive literature pertaining to the subject since DARWIN first popularised it, express our surprise at Mr. WEBSTER'S statement that “There are few plants that have received less attention and about which greater ignorance prevails than our native Orchids.” We should have said that of all our wild plants there are none that have received more attention of late years.

—MESSRS. CARTER'S SEED CATALOGUE AND VADE MECUM.—This useful guide in matters pertaining to gardening, especially to the amateur, is now before us. It is profusely illustrated with woodcuts and coloured plates representing the newest and most popular varieties of roots, vegetables, and flowers—amongst the figures of vegetables there being a life-sized one of a growing plant of Pea Carter's Anticipation, a variety whose quality, may be judged from the testimonials adduced. The colours of the florists' flowers are of the brightest, and the forms of the flowers and roots are of the usual distressing regularity of outline. The sketch of the Model Cucumber seems to be “out of focus,” as the ground is piled with examples that are of Titanic proportions.

—“THE BUILDING NEWS.”—This journal is almost too generous. When so much is given for a small sum doubts as to quality arise. To allay these at once, we advise all concerned to buy a copy, and judge for themselves. Having done so, if they do not say they have got value for their money in all ways we shall not set much store on their opinion. Moreton Hall, Cheshire, and some of the other illustrations, in widely different styles of architecture, should be valuable as suggestions to the landscape gardener, who, too often, does not sufficiently harmonise the outlines of his flower-beds with those of the buildings near which they are placed.

—ROSE HER MAJESTY.—Mr. BENNETT asks us to insert the following note:—“I am compelled once more to refute a misstatement of ‘Wild Rose’ in the *Gardeners' Chronicle* of December 11. He states that I ‘announced ‘Her Majesty’ as a cross between two H.P.'s, I believe, although I never happened to see his announcements.’ I desire to give the most emphatic contradiction to this statement. In point of fact I have never announced this Rose, having disposed of the whole property privately to an American florist, *H. Bennett, Shepperton*.”

—MISTLETO.—The cider orchards of Normandy contribute largely to the supply of this essential in our festivities at this season; in fact, it is from that part of France that by far the largest quantity is received in London daily, coming in crates of about 27 cubic feet capacity. These crates are numbered by thousands per diem.

—CHISWICK HORTICULTURAL SOCIETY.—At a meeting of the committee, held on December 16, it was decided to hold the summer show on Thursday, July 14, 1887; and the autumn show on Thursday, November 17.

—FRENCH BEANS.—These can now be bought from retail shops for 4s. per pound, and the question naturally arises—where do they come from? It is from Madeira and the south of France, but chiefly from the former island, whence they arrive at Covent Garden Market in large quantities, packed in cases consisting of four boxes bound together; each box is about 3 feet by 4 inches, and the entire case contains about 14 lb. weight. The supply from the south of France is much smaller, and the packages hold only

about 1 lb. each. These Beans are quite fresh, very clean, and being sold at 4d. per pound, must run the forced English Beans out of the market.

—Ghent “Chambre Syndicale.”—At a meeting held on Monday, the 13th inst., the following awards were made:—

First-class Certificates.—To M. Ad. D'Haene, for *Calanthe Veitchii rosea-alba*; to M. Louis Van Houtte, for *Cypripedium Leeanum* and for *Cypripedium Leeanum superbum*; to M. Jules Hye, for *Cypripedium caudatum roseum splendens*, *Cypripedium polium*, and for *Cypripedium Lawrenceanum var. extra*; to Messrs. Boelens Bros., for *Odontoglossum Alexandre var. alba*; to M. Louis Desmet-Duvivier, for *Dracena fragrans aurea lineata*.

Cultural Certificates.—To Madame V. Van Acker-Maenhout, for *Tillandsia tessellata*; to M. Bernard Spaë, for *Cycas circinalis*; and to M. Jules Hye, for *Restrepia antennifer*.

Commendations for Culture.—To M. Jules Hye, for *Cypripedium tomm* and for *Cypripedium syltense*; to M. Spaë-Vandermeulen, for *Cycas siamensis*.

—MIDWINTER CHRYSANTHEMUMS.—The National Chrysanthemum Society, with the object of encouraging the cultivation of this flower in mid-winter, when greenhouse flowers proper are but few, are offering good money prizes to be competed for at the Aquarium, Westminster, on Wednesday and Thursday, January 12 and 13 next. There are various prizes for cut blooms of any varieties, for collections of cut blooms of special kinds, and for bouquets, but none for Chrysanthemum plants.

—NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.—The last monthly meeting of the year of this Association was held on Friday evening, the 17th inst., in the Christian Institute, Aberdeen. There was a full attendance of members, and the President, Mr. A. ROBINSON, occupied the chair. Papers on “Rare Vegetables,” were read by Mr. J. WILSON, Charleston Gardens, and Mr. R. GRIGOR, Sunnybank, both of whom treated the subject in a very intelligent and entertaining manner. A paper on “Potatos,” by Mr. R. FARQUHAR, Fyvie Castle, was read by the Secretary. Votes of thanks were accorded to several exhibitors for specimens of Chrysanthemums, plants and vegetables, that were brought under the notice of the Association, and to the Chairman.

—BAUHINIA TOMENTOSA VAR. GLABRA.—There is a figure of this variety in the *Botanical Magazine*, t. 5569, taken from a plant that flowered at Kew in 1866 from seeds sent from Bembé in Benguela six years previously. Taking the species in its widest sense, it occurs wild in Ceylon, India, and several parts of Africa, such as Natal, Senegal, and Dammar Laod. With such an extensive distribution, it is not surprising to find some variation in the plant. The form under notice differs from the type in being finely pubescent, while the latter is distinctly villous. The flowers in both cases are yellow, with a dark brown or almost black blotch on the base of the upper petal, and are produced two or three together, terminating the branches. In Ceylon it is said to attain a height of 6—12 feet, but under cultivation and restricted for root-room in a pot it flowers when 3 or 4 feet high, and has a close branching and bushy habit. The recent fog was by no means favourable to the longevity of the flowers, which are somewhat campanulate, and never spread out so flat as those of *B. natalensis*. Nor are they so freely produced as those of *B. natalensis*, nor very dwarf bush, from Natal, with almost pure white flowers, and now fruiting freely in the Palm-house. Both species are readily amenable to pot culture, requiring no special treatment beyond a stove temperature and good rich, fibrous loam, with sufficient sand to keep the soil sweet and open, with plentiful supplies of water during the growing season.

—GARDENING APPOINTMENTS.—Mr. W. BRITAIN, late of the Royal Horticultural Society's Gardens, South Kensington, has been appointed Head Gardener to Lady POLLOCK, Hatton Park, Feltham, Middlesex.—Mr. EDWARD COCKBILL, late Foreman at Rolleston Hall Gardens, Burton-on-Trent, has been appointed Head Gardener to CHARLES HILL, Esq., Clevedon Hall, Somerset. The following appointments were effected by Mr. JOHN DOVING, Edinburgh:—Mr. PATRICK BERINGHAM, as Head Gardener to the Rev. A. MASSON, the Manse, Kirkliston, N.B.—Mr. ALEXANDER MACLEAN, as Head Gardener to Col. HANBURY BARCLAY, Cross Oak, Great Berkhamstead.—Mr. GEORGE WRIGHT, as Head Gardener to W. D. CREVEDON, Esq., Helme Lodge, Kendal.—Mr. ANDREW FOGG, as Head Gardener to H. T. STAINTON, Esq., Munsfield, Lewisham, London, S.E.—Mr. WM. SCOTT, as

Head Gardener to Hon. H.V. BOURKE, Hayes House, Beau Park, co. Meath.—MR. ANDREW SMITH, as Head Gardener to GEORGE UKE, Esq., Whatlands House, Bonnybridge.

Florists' Flowers.

GREENHOUSES: THE AZALEA.

The principal collection of plants intended to flower in May and June require but little attention at present. They should be placed in a cool-house, well ventilated, and arranged so that they are not too much crowded. Some persons keep their plants too dry at the roots during the winter, evidently with the best intentions, the main object being to rest them. This over-dryness at the roots is an evil which tells upon the health of the plants for a long time after the winter is past. The sandy peat in which the plants have been potted is generally so thoroughly permeated with roots, that it is difficult to get water through the mass, when once they have become dusty dry. The plants ought to be moderately dry before being supplied with water, and when it is applied enough should be given to thoroughly saturate the soil. In an over-dry warm greenhouse thrips and red-spider will not only exist during winter, but will increase and do mischief. Tobacco-smoke will destroy the thrips, but does not touch the red-spider: it cannot however stand Tobacco in solution. Soft soap dissolved at the rate of two ounces to the gallon of water and half a pint of Tobacco liquor added to two gallons of this soft-soapy water, will destroy both spider and thrips. The dead and decaying leaves should be removed with as little delay as possible. The early flowering varieties should be placed in a gentle heat early in the year. The double white varieties are excellent for early flowering. The leaves may be syringed daily underneath after the plants are placed in heat.

CAMELLIAS.

Every autumn and winter we hear complaints of the flower-buds dropping off, and the cause of this is often a puzzle to the owner of the plant. No one takes blame to himself for this. As a matter of fact, however, it is the cultural details that are to blame. Leave the plants out-of-doors planted out in the open ground with no care whatever, and the buds do not drop off. Sharp frosts have but little effect upon them, or planted out in a prepared border of a conservatory, and well watered, with sufficient ventilation, they do not drop either, unless exposed to bad draughts of air; and I must admit that I saw the buds scattered thickly underneath some well-managed plants in a conservatory border a few days ago, but they were exposed to a dense fog in London—one of the worst ever experienced. Over-dryness at the roots of the plants, or a very dry atmosphere caused by flues or hot-water pipes, will cause the buds to drop. Any sudden changes will cause it, such as bringing the plants inside after being out late in the autumn; the change from the leaves being nightly saturated with heavy dews, to the relatively dry atmosphere of greenhouse or conservatory, is an illustration of this. The change should be gradual. Let the leaves be kept quite clean during winter by sponging when time can be spared; the plants also like a fair supply of water at the roots. *J. Douglas.*

CHRYSANTHEMUMS AT THE BIRMINGHAM BOTANICAL GARDENS.

This year Chrysanthemums have been grown extensively and well at these gardens, and although the season is getting advanced as far as the Midlands are concerned, there is still a very pretty show of these beautiful flowers remaining.

Five weeks ago such grand old varieties as Elaine, James Salter, and the new Lady Selborne, stood out conspicuously, and were followed at no great distance as to date by that most reliable of all the Japanese exhibition varieties, Madame C. Audigier, and more conspicuous, but by no means so massive, was Soleil Levant in all its beauty—a variety which has done exceedingly well this season at the Gardens. Very beautiful, and perhaps even more admired by the majority of the visitors, have been the smaller flowered varieties, such as La Charmeuse, Tendresse,

Tokio, and Etoile du Midi—this latter one of the brightest and, as grown here, of first-rate lasting properties, a great consideration where only a limited quantity can be cultivated.

Cullingfordi is exceedingly brilliant and good; and standing out in good form is that grand old white in the Anemone section, Fleur de Marie, the chaste beauty of which, as seen in the dull winter days, when most of its companions are "faded and gone," is almost sufficient to make an enthusiastic lover of the Chrysanthemum exclaim, "If limited to one I would grow thee!"

The able Curator of these gardens is to be highly complimented on the condition of his plants, and having now at command a capital range of glass in which to arrange them, and occupying as he does the position of President of the Birmingham Chrysanthemum Society, visitors may rely upon an annual repetition of the treat they have been provided with at the Botanical Gardens. *J. H. H., December 17.*

BIRTH OF AN OVULARIAN ZOOSPORE.

BRIGHT little mystery! I shall never forget you. Many and many a time have I resolved to tell the

FIG. 150.—LIBERATION OF OVULARIAN ZOOSPORE.

world the story of your birth. You were the most marvellous thing in vegetable life that ever objective conveyed to my brain. In 1881 I discovered a new Ovularia blackening the leaves of Lilac in the same way as the P. infestans blackens the leaves of the Potato. Its parasitic mycelium ramifies in the tissues, and sends up conidiophores through the stomata of the under surface of the leaf, carrying single conidia at the tip of a much larger size than those of P. infestans.

As was natural, I gave close attention to many phases in the character of the new parasite. But with only one of these am I at present concerned. It is known that various parasitic conidia perpetuate the life-circle in various ways. The contents, which are at first granular plasma, either remain granular plasma, which germinates into tubes of mycelium issuing from the ostium, and sometimes through the walls of the conidium in all directions; or they sometimes escape by the ostium in the same granular form which they had when inside, and then increase into larger sporidia, from which issue webs of mycelium; or the contents of the conidium sometimes more or less completely develop into zoospores. These methods have been described as different modes of germination; but in reality when they are considered, it is seen that they are only varying details of one principle—the contents of the conidium in each case are simply going on to the

next stage, the production of resting-spores and other forms of the non-parasitic mycelium.

It was Sunday morning, November 6. "The works of the Lord are great, sought out of all them that have pleasure therein." The leaves of the Lilac were still green, except where the parasite had germinated, and they were covered with dew. I knew that the night must have given rise to great numbers of conidia; and going out for a leaf, I scraped off the material from the under side at the border of a black spot, and placed it in a film of water upon a slide, and placed it under a quarter-inch. The very first point I focussed upon enclosed a conidium nearly full of magnificent zoospores. They were moving about in all directions like tigers in a cage. I did my best to count them, and thought there were sixteen. Round and round the walls they went. They pressed upon each other and thus assumed irregular shapes. But they had also amoeboid faculty, and sometimes threw out arms, and drew them in again. It was clear that they had tendencies within their walls. A bright nucleus glowed in each of them, and the currents of protoplasm were in eager activity. Round they go, pressing upon each other, in the manifest desire to escape into a wider world. But how shall they escape? Will the walls of their house burst and launch them into the flood? There seems no reason that they should, for there is a good deal of unoccupied space. And now they approach the ostium. But is there any open door? If there is, it is far too small to permit of the exit of any one of the family. An impatient rover approaches the door; but how will he get out? Will the door open wider? He is much too big for the round pore of an opening. Will the crowd behind push him out? But they have mostly retired from contact with him. But has he not amoeboid instincts? And will he not bring them into play? Look at that (fig. 150, 1). He has thrust an amoeboid arm into the ostium. What of that? His round circumference is behind, and cannot get through so small an aperture. He can be only feeling if there is a door of escape. No! He is wiser than Solomon. Observe that stream of protoplasm rushing up the arm; see the little ball accumulating on the apex of the papilla; and now he has assumed the form of dumb-bells (fig. 150, 2). One-half is already outside, with a filament reaching back to the other half inside; and still the stream rolls forward and the granular current carries the joyous life outward and outward. The rate increases; and now nothing is left inside but an arm like that which pioneered the little adventurer (fig. 150, 3). A jerk, and the arm is withdrawn through the door and falls into the globular mass, which now with waving cilia bids adieu to his brothers left behind, and plunges many a millimetre wide through the bright blue waves, and away beyond the entranced field of vision (fig. 150, 4, 5). *A. Stephen Wilson.*

PLANTS AND THEIR CULTURE.

THE CONSERVATORY.

THE most difficult season to keep up a gay appearance is now past, and from this date, if a good assortment of forcing plants has been selected and started in regular succession, the clearing out of the early winter flowering plants gives the opportunity of thoroughly cleaning glass, stages, and regulating any creepers that may require it. Camellias that are now coming in will be most acceptable. See that the plants are not near the hot-water pipes, as they soon get dry, and always then cast their buds. Foliage plants suitable for the cool house during the winter season are not very plentiful, but there are several very useful, and that produce a graceful effect when mixed with flowering subjects:—*Aspidistra lurida variegata*, *Aralia Sieboldii variegata*, *Ophiopogon Jaburan variegatum* (this is a most useful foliage plant at all times), *Grevillea robusta*, *Coprosma Baueriana*, *Lomatia ferruginea*, *Melianthus major*, *Draena*; of the more hardy kinds, such as *D. australis*, *congesta*, *indivisa*, *lineata*, and *rubra*; *Abutilon Darwinii tessellatum*, *A. Sellowianum marmoratum*; these, with a few *Yuccas* and *Dasylirions*, comprise those usually found. The plants of *Tropaeolum Bull of Fire*, which were put in their flowering-pots in September, will now be nicely in bloom, and may be brought into this house, and trained in a suitable place. Be careful not to allow more moisture about the house than is really required, as it causes the flowers to damp. *A. Evans, Lythe Hill, Haslemere.*

MESSRS. SUTTON'S POTATO EXPERIMENTS.

We are indebted to Messrs. SUTTON for the following tables, which supply the complement to their former records (see ante, p. 656, and 1885, vol. xxiv., p. 530) —

Specific Weight of Messrs. Sutton's Potato Cresses weighed in Distilled Water at Standard Temperature.

Cross.	Numbers.	Weights.		Specific Gravity.
		In air. Grains.	In water Grains.

TRADE NOTICES.

HOOPEK & CO.

AN announcement has been received that this old and respected firm is to be converted into a limited liability company under the management of Mr. C. A. Hooper. The capital required is £100,000, in £10 shares. The firm has business houses in London, New York, and Paris. It is proposed that the firm shall be amalgamated with that of E. G. Henderson & Co., Maida Vale, and also with a wholesale seed house in the City.

THE COMPAGNIE CONTINENTALE DE GHENT. We understand that the business of this Company will be transferred shortly to Brussels, where MM. Linden will create a vast establishment for the introduction of new plants, especially Orchids, under the name of Messrs. Linden & Co. The nursery at Ghent will be discontinued, the site being required for building purposes.

MIDDLETON PARK FAVOURITE BEET.

Mr. H. Deverill, Royal Seed Stores, Banbury, states that he has had placed in his hands by Mr. Hoop the stock of the Middleton Park Favourite Beet, which he is now distributing to the trade.

HOME CORRESPONDENCE.

Active Plant Growth Throughout the Winter.—It has been well said that vegetation, as regards deciduous trees, does not rest in the form of becoming really inactive during the winter months. As regards certain kinds of trees or shrubs, it is too much to say the constant activity they display during the winter season nearly equals that of summer? That this is so in the matter of fruit-bud development I am able to prove. Take, for instance, the Aucuba. In regard to them the flowers are fertilised in the spring—and that somewhat early—following which the embryo fruits do not seem to advance in size by one-half during the whole of summer. As the sun's power declines, and during the month of October, the berries commence to swell, and thence onward throughout the winter months they continue to enlarge until the spring arrives, when they have grown to their full size, at which period the process of stoning commences, followed, as the sun gains power, by ripening into their characteristic glowing colour. Again, are not similar facts observable in connection with the Arbutus, which flowers at the most unfavourable time of the year, the individual blooms of which are so formed, however, as to afford the greatest possible protection from frost and moisture. I add one more instance—that of Hedera, which bloom so sweetly in the waning warmth of summer. Nature permits insects that are partial to saccharine food to come forth once more and sip the nectar thus offered. Ivy berries, in like manner, swell unchecked throughout our night of winter. We may infer from these facts that one reason why evergreen plants exist in cold climates, is that the season of fructification being too long to permit of leaf-nakedness—though I am not long-sighted enough to attribute to evolution—that this influence may have given us evergreens or plants that do not dispense with their foliage entirely. William Farley.

Pandanus variegatus.—It may be worth while giving this plant—which is a fine example now growing in the Botanic Gardens at Jamaica was recently figured in the *Gardeners' Chronicle*—its full name, there being no species of Pandanus named variegatus, and at least two well known garden kinds having silvery variegated leaves. Mr. Morris, who is of course well acquainted with the Jamaica specimen, informs me that it is *P. javanicus* var. *variegatus* (*P. candelabrum* variegatus of some), or rather, that it was that plant, for it seems the leaves on this old plant are all green, like the type, although suckers from the base of the stems have leaves more or less striped. We have at Kew both the green and the variegated forms of this species, but they are both comparatively small plants. It is curious how many plants have variegated leaves in the early stage and den, which has the leaves prettily variegated with yellow when in a small state, becomes green-leaved when large; the variegated *Rhipis* soon loses its attractive streaks of white when it gets beyond a foot or so in height; *Aralia Sieboldii*, *Cricium asiaticum*, *Musa zebrina*, *Curculigo recurvata*, and *Aspidistra luidia*, are in some forms variegated when young, but become almost or entirely green when mature; and there are other well known instances of the same kind. Pandanus *Veitchii* is handsomely variegated with us, can any one say if the leaves are green in old plants? *W. Watson, Kew.*

Adiantum Farleyense.—I quite agree with Mr. A. Hemsley when he states that Adiantum Farleyense can be increased by other means than spores, and that portions of rhizoms will produce young plants. Mr. Hemsley thinks it "remarkable that a seedling should spring up where no fertile fronds were known to exist," and throws out a suggestion that "if it was almost any other Fern, means would be found by which spores might be transmitted." Why should spores not be transmitted from an Adiantum Farleyense as well as any other, although of a very rare occurrence in the one case? I have no doubt what-

ever that the plant found here was a seedling, it being absolutely impossible for any other than a spore to get into the pot in question. In other pots beside the one A. Farleyense was found in there were other seedling Ferns, such as A. cuneatum, *Pteris*, &c., and no one will question that they were other than spores at first. I would count it somewhat remarkable if a part of rhizome would get into the pot that the A. Farleyense seedling was found in—the one was 5 or 6 feet from the other; while the A. Farleyense had been reported, the other had neither been reported nor top-dressed, so the rhizome could not get into the pot that way, as Mr. Hemsley points out it may have done; neither could it be a small portion broken off with an old frond, as the position of the pots would prevent such an occurrence from taking place. *T. B. E.* [Very small pieces of a rhizome of a Fern can be carried from one place to another by various unsuspected agencies, and we know that young plants springing from such pieces have all the appearance of having grown from a spore. Ed.]

Calvary Clover.—In answer to "Quilon," p. 762, you say of the Calvary Clover, "It is interesting to find this plant should succeed in the open field of Cheltenham." I may supplement your remark by saying, that here, at Wicomicore, it succeeds with out any trouble whatever and ripens its seeds perfectly. This year I have had in the open garden this summer six plants, from which I have gathered 280 seeds, all ripe, and from which I have now young plants. In our moist climate we have only to leave the seeds hanging on the plants, and about October the cotyledons begin to force their way through the prickly pod. When the two seed-leaves are well through, I take off the pod, place it in an ordinary pot, and raise the plants without the least difficulty. I shall be glad to know what you consider its true botanical name: I believe it is *Medicago hystrix*, but I have seen other names given to it. *A. R.* [*Medicago echinus*, see fig. 244, 1873, p. 1145. Ed.]

Rose Stocks.—Mr. B. R. Cant, in speaking on this subject at the recent meeting of the National Rose Society, said that he wished experiments were made with Roses on the three stocks—Manetti, seedling Brier, and Brier cuttings, and added that he would be happy to supply any rosarian who would undertake the trial with a number of Brier cutting plants, and I believe Mr. George Prince would do the same with Brier seedlings, while Manetti plants are to be had anywhere. It is to be hoped that this offer may be accepted, and the experiment made. *W. D. Rose.*

Celery White Plume.—This new kind, when first introduced, was not spoken very highly of, but has since gained favour. It is very useful for early work, as it requires less blanching, and also less room, being dwarf. It is very good for stewing purposes, being very white and clear. The beautiful white foliage is very pretty mixed with cut flowers, and not easily recognised at first. It has a long life in pots into consideration it may be called a useful variety. It will not bear frost, the delicate parts changing to brown on the first pinch. *W. D., Wierton, Maidstone.*

Berberidopsis corallina.—In a recent issue of a contemporary it is remarked that this beautiful shrub is slow to propagate. Such is not the case if the right method be taken with it. It is undoubtedly slow when done out-of-doors, as in the case alluded to; indeed, in the colder parts of the country it will not do at all in that position, and the writer referred to has to thank his exceptional position and climate for the small measure of success he records. If good, sturdy, short-jointed cuttings, or even strong single eyes with the leaf attached, are put into a bed or pot spring, the plants will be ready to pot off in five or six weeks afterwards. Establish and grow them on under glass till July, when they may be placed out-of-doors, and by autumn will be fine plants, having more vigour and bulk than those raised out-of-doors would have in three or four years. *H. S.*

Celery Fungus (*Puccinia bullata*).—R. Irwin Lynch, the Botanic Gardens, Cambridge, would be greatly obliged to any friend who would do so good as to forward him a bundle of leaves infested with this fungus (see *Gardeners' Chronicle*, December 11). He would be glad to return stamps for postage.

Transplanting Machines.—Your correspondent, "C. S. F.," under the head "Removal," says, "Many machines have been invented for this purpose, notably McGlashan's and Barron's, and while each has its several advantages, none has come into general use, &c." As an undoubted contradiction of this statement I hand you one of our catalogues, which I beg you will forward to him, which proves

that our machines have been let out on hire for over thirty years; independently of what had been accomplished at Elvaston Castle, ever since February, 1831. The high testimonials of success therein contained, which have been selected from a very large number, prove the general use of our machines over England, Scotland, Wales, and Ireland. Besides having supplied machines to order of different sizes, we keep six sizes for hire, capable of removing trees from 12 tons to half a ton, which this autumn been employed on seven estates in five different counties. *William Barron, Birmmgham.*

Reports of Societies.

LINNEAN: December 16,

H.R.H. the PRINCE OF WALES was elected an Honorary Member.

PREHISTORIC GRAIN.

Mr. W. Carruthers exhibited a spike of Maize from an ancient Peruvian grave, and samples of Wheat from ancient British and Romano-British burial-grounds near Salisbury.

Sisal Hemp.

Mr. D. Morris exhibited the fresh cut leaves and the fibres of two species of Agave, viz., *A. ixtli*, and *A. Salmtyckii*. The former has been traced as one of the plants yielding the Sisal Hemp of commerce. The fibre prepared from these two plants was shown, and the merits of each dwelt upon at some length. The fibre of *A. Salmtyckii* is peculiar in possessing a curly nature so as to render it unfit for commercial purposes; and hence attempts to utilise the fibre of this plant, which is very common in the West Indies, have hitherto proved fruitless. On the contrary, however, the fibre extracted from the allied narrower-leaved species, *A. ixtli*, consists of glossy strong threads, which are admirably adapted for rope making, and consequently are a valuable produce. In proof of this, the export of Sisal Hemp from Yucatan, is stated to reach the sum of £500,000 annually.

APOSPORY.

A paper was read on "Apospory, and Allied Phenomena," by Professor F. O. Bower. The paper describes the phenomena in detail, and shows how, in the *Polystichum* at least, four different modes of origin of the oophores may be distinguished, two being in connection with the sorus, while two are at points apart from the sorus, and may even occur on fronds which bear no sorus at all. The latter part of the paper is occupied by comparing these phenomena with others already known in the higher and lower plants. The general conclusion drawn from this comparison and from the facts themselves is that the whole phenomenon of apospory is to be regarded rather as a sport or bud-variation than as a reversion bearing deep morphological conclusions with it.

Mr. C. T. Drayery gave a communication on a new instance of Apospory in *Polystichum angulare* var. *pauciflorum*, Westl. From his observations he infers that the information of this prothallus is preceded by a very different series of phenomena from those already recorded. In the one case the prothallus are simple extensions of the cellular substance of the tips of the pinnales, commencing at points quite beyond the venation, and produce no root hairs unless brought into contact with the soil. In the other case, however, the prothallus is a direct outgrowth of the tip of a venet, protruded through the upper surface of the pinnales, and at once produces root-hairs in abundance long before it assumes any other characteristic of a prothallus, and finally the resulting prothallus is much thicker in substance.

FOSSIL GRASSES.

We can imagine some readers shrugging their shoulders at such a thing, as one too speculative and transcendental to come within the domain of practical thought. That it is not so, however, is shown by Mr. J. STARKIE GARDNER'S paper on the subject, recently reprinted from the *Proceedings of the Geologists' Association*. Mr. GARDNER begins by pointing out the vastness of the practical interests concerning grasses, and estimates that the products of grasses, cereal grains, sugar, fibre, &c., amount up to about £100,000,000 annually. That will do for Mr. GARDNER. Then Mr. GARDNER goes off into facts and inferences of a different character, which Mr. GARDNER would not appreciate, but which, nevertheless, measured even by GRAGERIND'S standard, enormously outweigh the economic importance of grasses

as computed in merchant's ledgers. What sort of a globe could it have been when there were no grasses?—a question of no practical importance it will be said; but put the question in another form, and ask how the earth became what it is, how it became habitable by insects, by animals, by man himself?—and then the answer comes with no uncertain sound. It is the grasses that have mainly contributed to make the earth habitable, and without them it would be so no longer. How this is so, is clearly shown in Mr. GARDNER'S pamphlet, where he shows the probability that there were no social grasses before Late Tertiary times (geologically a very recent period). Millet and Rice had their prototypes in the Tertiary deposits of Ormingen. Through the long ages of the Red Sandstone, the Lias, the Oolites, the Wealden, up to the Tertiary times there were no great mammals fitted for grass-eating, and there was no grass for them to eat, or at least there is no evidence of the existence of anything like pastures. Butterflies, beetles, bees, grasshoppers, could not have existed. "The introduction," says Mr. GARDNER, "of the grasses in vast numbers, and of habit different to that of pre-existing vegetation, exerted an influence on terrestrial life that is without parallel, the immediate effects of which were:—The development of meadows, a prairie vegetation as distinct from that of the marsh, scrub, and forest; the introduction of vast herds of grazing mammals as distinct from the herbivorous mammals previously existing, and of the larger kinds of carivora which prey upon them; the introduction of meadow insects, distinct from aquatic and woodland forms, including butterflies, bees, grasshoppers, &c.; and lastly, the introduction of a food supply, both animal and vegetable, in the absence of which, it is doubtful whether man himself would have been enabled to reach his present stage of development."

Law Notes.

WARWICK COUNTY COURT.

The December sitting of this Court was held on the 14th inst., at the Shire Hall, before Sir R. Harrington, Bart., Judge.

AN UNSATISFACTORY SALE OF SAND AND PEAT.

Kesterton v. Greenfield.—Plaintiff was John Kesterton, sand merchant, Devonshire Street, Cheltenham, and the defendant Robert Greenfield, of The Priory Gardens, Warwick.—Claim 18s. for peat and silversand supplied to defendant in August last.—The defence was that the goods were inferior to sample, and that the sand was nearly two bushels short in measure. Plaintiff had had due notice of their rejection. Upon the sand being measured it was found to be nearly two bushels short, while the peat was simply worthless. Mr. Boddington informed the judge that his client held a responsible position at The Priory, and to have paid the plaintiff the sum demanded for such stuff as he sent to him would have been to subject his employer to gross imposition. Therefore he defended the action purely on principle. Mr. Boddington quoted the case of *Grimmily v. Wells*, tried in the Court of Common Pleas, in which it was decided that the buyer is under no obligation either to return or offer to return goods to the seller, or to place them in neutral custody, when upon inspection the bulk proves to be inferior to sample. It was sufficient for the buyer to give clear notice to the seller that he rejected the goods, and that they were at the seller's risk, and in that rested with the seller to remove them.—His Honor, without calling upon the defendant's witnesses, decided to go down to The Priory gardens, inspect the sand and peat, and compare them with the samples shown by plaintiff. Having done this he gave judgment for the defendant, believing that the peat was not according to sample, and that the defendant had a right to reject the whole. He could not conceive that a person occupying the defendant's position would come forward and deliberately perjure himself. Judgment for the defendant, costs to follow in the ordinary way. *Warwick paper.*

Obituary.

MR. THOMAS BROWN, formerly the senior partner in the firm of Thomas and Edward Brown, of the Royal Nursery, Slough, died at Honolula, Sandwich Island, on October 22 last, at the advanced age of eighty-two years. To many of the younger generation of florists Mr. Thomas Brown will scarcely be remembered by name, but to not a few of an older time Brown's nursery, and what the firm did for floriculture half a century ago, will always be a pleasant recollection.

The story of the foundation of the Royal Nursery at Slough has been told in the columns of the *Gardeners' Chronicle*; suffice it for the present purpose to state that in 1835, on the death of their brother Charles, Thomas and Edward Brown became the sole partners. Edward retired in 1837. Thomas carried on the business until 1849, when it passed into the hands of Mr. Cutler, and in 1844 the late Mr. C. Turner became the proprietor.

Thomas Brown was born at Slough on July 27, 1824; he emigrated to Honolulu in 1846, and engaged in stock raising on Kanai. In 1852 he went to the American States, but returned to the islands in 1856. He soon afterwards entered the Office of Conveyances as clerk, then became Deputy Registrar, and finally was appointed as head of the department, which position he held up to the time of his death. He was a man of sterling business qualities, his unaffected and affable manner won him hosts of friends, and he was regarded as one of the oldest and most respected citizens. On October 15 he celebrated the fiftieth anniversary of his marriage, since then his health gradually failed, until he passed away peacefully surrounded by his family. He leaves a widow, four sons, and a daughter, the eldest of the former being the Hon. Cecil Brown, a member of the Legislative Assembly. Thomas Brown lies at rest in the Nunaw Valley Cemetery, far removed from the place of his birth.

—DR. LYONS, M.P.—All who are interested in the development of the resources of Ireland must lament the death of this gentleman, who did so much to advocate the afforestation of that country, than which a more beneficial thing can scarcely be imagined where the conditions are favourable.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DECEMBER 22, 1886.

Dec. 16.—Misty, with light rain early in the morning, fine and bright at about noon, and overcast afterwards.
 17.—Fog in morning. Overcast all day. A shower of rain in the evening.
 18.—Snow in early morning. Fine and bright from noon. Fine night.
 19.—Fine and bright generally till afternoon, misty at 4 P.M., and fog in the evening.
 20.—Overcast and dull throughout.
 21.—Dark and very dull till afternoon, then foggy, and clear at night.
 22.—The minimum temperature of 15° took place shortly after midnight of the 21st; the temperature then rose rapidly to 24°, by 2 P.M. to 36° by 9 A.M., and to maximum, 43°, by 4 P.M. The morning was fine, but then rain began to fall at about noon, and continued to the evening.

ENGLAND: *Temperatures*.—During the week ending December 18, the highest temperatures were 53° at Truro, 54° at Plymouth, and 49.5° at Bristol; the highest at Newcastle was 41°, at Sunderland 45°, and at Sheffield and Liverpool 40°. The general mean was 47.9°.

The lowest temperatures in the week were at Wolverhampton 19.5°, at Nottingham 20.2°, and at Sheffield 21°; the lowest at Truro was 30°, at Plymouth 29.2°, and at Brighton 26.8°. The general mean was 24°.

The greatest ranges of temperature were at Nottingham 29.1, at Wolverhampton 28.4, and at Bradford 25.5; the least ranges were at Newcastle 17, at Liverpool 19.6, and at Brighton and Sunderland 22.

The mean of the seven high day temperatures was highest at Truro, 49.3, at Plymouth 48.9, and at Brighton 43.7, and lowest at Newcastle, 36.8, at Sheffield 39.1, and at Liverpool 39.9. The general mean was 41.9.

The mean of the seven low night temperatures was lowest at Newcastle, 36.8, at Wolverhampton 31.7, and at Sheffield and Sunderland, 32; the lowest at Truro was 37.7, at Plymouth 37.5, and at Brighton 37. The general mean was 35.9.

The mean of the seven daily ranges was greatest at Truro, 11.6, at Plymouth 11.4, and at Nottingham 9.6; and least at Brighton and Newcastle, 6, and at Blackheath 6.1. The general mean was 8.

The mean temperature was highest at Truro, 43.5, at Plymouth 43.2, and at Brighton 40; and lowest at Newcastle, 33.8, at Sheffield 35.6, and at Wolverhampton 35.9. The general mean was 37.9.

Rain.—The largest falls were 1.92 inch at Newcastle, 1.88 inch at Bradford, and 1.87 inch at Preston; the smallest falls were 0.61 inch at Blackheath, 0.69 inch at Sheffield, and 0.91 inch at Wolverhampton and Liverpool. The general mean fall was 1.47 inch.

LONDON: Atmospheric Pressure.—During the week ending December 18, the reading of the barometer at the level of the sea decreased from 29.43 inches at the beginning of the week, to 29.34 inches by the morning of the 12th, increased to 29.73 inches by 1 P.M. on the 13th, decreased to 29.11 inches by the afternoon of the 15th, increased to 29.72 inches by the morning of the 17th, decreased to 29.62 inches by the afternoon of the same day, and was 29.75 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.50 inches, being 0.20 inch higher than last week, and 0.49 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 47° on the 14th; the highest on the 18th was 31.7°. The mean of the seven high day temperatures was 41.4°.

The lowest in the week was 23.5° on the 18th; the lowest on the 18th was 41.2°. The mean of the seven low night temperatures was 35.3°.

The greatest range of temperature in one day was 8.5° on the 14th; the smallest was 3.5° on the 17th. The mean of the seven daily ranges was 6°.

The mean daily temperatures were 43.3° on the 12th, 43.4° on the 13th, 43.5° on the 14th, 43.3° on the 15th, 36.6° on the 16th, 31.9° on the 17th, and 27.5° on the 18th. These were above their averages on the 12th, 13th, 14th, and 15th by 2.6, 2.8, 2.8, and 2.6 above; and below on the 16th, 17th, and 18th by 4.1, 8.6, and 12.7 respectively.

The mean temperature of the week was 38.7, being 3.7 lower than last week, and 1.9 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 71° on the 12th. The mean of the seven readings was 54.5.

Rain.—Rain fell on four days, to the amount of 0.61 inch.

SCOTLAND: Temperature.—During the week ending December 18, the highest temperature was 45.8, at Leith; the highest at Perth was 39.2. The general mean was 39.8.

The lowest temperature was 21°, at Perth; the lowest at Paisley was 24.5. The general mean was 23°.

The mean temperatures were highest at Leith, 34.4; and lowest at Perth, 30.4. The general mean was 23°.

Rain.—The largest fall was 0.90 inch, at Aberdeen. No rain fell at Perth. The general mean fall was 0.55 inch.

JAMES GLAISHER, F.R.S.

NOVA-SCOTIAN APPLES.—Some idea of the immense consumption of Apples from across the Atlantic may be gathered from the fact that frequently in a single day one auctioneer in Covent Garden Market sells under the hammer 10,000 or more barrels of fruits from Nova Scotia. And the same may be said of other salemen.

Answers to Correspondents.

ÆSTHETIC FLOWERS: W. R. We scarcely understand the meaning of this term, unless it be meant for such plants as Helianthus, both single and double flowered; single Dahlias, Chrysanthemum, single Chinese (seedlings), and British wild species; under the designation might be put Galliardus, Zinnias, Callandrias, Petunias, &c.

CATALOGUES: I. I. I. We cannot undertake to recommend price-lists. Examine our advertising columns.

CORNUS: Omega. We could only find one twig, which we were unable to identify. Cornus sanguinea varies considerably in the depth of its coloration. C. sibirica is a variety of C. alba, and is generally darker in colour than C. sanguinea.

ERRATUM: P. 777, first col., "The Onion," tenth line. Instead of "conqueror" read "congener."

FLOWER GARDEN PLANS: C. W. A. Kemp's How to Lay-out a Garden, published by Bradbury, Agnew & Co., 9, Boquerie Street, Fleet Street, London, E.C.

GARDENIA ROOTS: F. S. C. The knobs on the roots are due to the presence of minute worms, similar to those which cause one form of Cucumber disease. Turn out the soil, burn the plants, and start afresh.

HEATING AND COAL: W. H. S. We think the quantity of coal used was small, considering the amount of 4-inch pipes. The boilers and pipes must have been carefully arranged and fixed, or else, in spite of your mild locality, more fuel would have been required.

INSECTS: C. T. The shrivelled-up specimens sent of grubs which attacked your Carnations, penetrating the leaves and stems, are the larvae of a small two-winged fly belonging to the family Muscidae. Please send some live specimens with the attacked plants, that we may rear them. I. O. W.

NAMES OF FRUITS: E. & A. D. & Sons, 1, Rymer; 2, Boston Russet.—Pear: Ed. Morse. Name uncertain—a worthless variety.

NAMES OF PLANTS: S. Douglas. Probably Odontoglossum Dawsonianum, F. C. Gooden. East Indian. C. M. S. Adiantum. Probably R. Carey, but the specimen sent is insufficient for determination.

Markets.

COVENT GARDEN, December 23.

OUR CHRISTMAS trade has been somewhat below the average, notwithstanding the low prices, and many goods have only been cleared against the grower. James Webber, Wholesale Apple Market.

VEGETABLES—AVERAGE RETAIL PRICES.

Table with 2 columns: s. d. s. d. and items like Artichokes, Beans, Beet, Brussels Sprouts, Cabbage, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Lettuce, Mushrooms, Onions, Parsnips, Peas, Potatoes, Pumpkins, Radishes, Spinach, Tomatoes, Turnips, &c.

POTATOES: 1st Kent Regents, 5s. to 6s.; Schoolmasters, 5s. Beauty of Helston, 10s.; 2nd Regents, 6s. to 7s. per ton.

FRUIT—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and items like Apples, Grapes, Kent Cobbs, Lemons, Pears, Raspberries, &c.

PLANTS IN POTS—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and items like Aralia Sieboldi, Arum Lilies, Begonia, Bouvardias, Chrysanth., Cyperus, Dracena terminalis, Epiphyllum, Erica gracilis, Hydnalis, Regermanns, Solanum, &c.

CUT FLOWERS—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and items like Arum Lilies, Anemone, Camellias, Carnations, Chrysanth., Eucharis, Heliotrope, Jasmine, Lavender, Mimosas, Marguerites, Mimosa, &c.

SEEDS.

LONDON: Dec. 22.—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, E.C., state that with a thin attendance on the Seed Market but little business was transacted to-day. Operations in Clover seed, and indeed in most of the generally accepted sowing material until after the holidays, meantime values all round keep firm. For choice red seed somewhat higher prices are asked. Rye-grasses steadily maintain the recent advance. There is no change to be noted with regard to bird seed. Blue Bird seed met a rather improved sale. Linseed continues to tend in favour of holders.

CORN.

MARK LANE: Dec. 20.—The market opened very quiet, but the finish was tame, owing to an extensive lack of demand. English Wheat was generally held above the views of buyers, and very little was done, as over the rates of Monday last being paid. Foreign Wheat met a fair demand at 6d. advance, but as being in many cases required, checked business. Flour, of which the supplies have been lightened a good deal, is 6d. to 1s. per sack dearer on the week, with a fair inquiry. Very little was doing in maling Barley, and prices were unchanged. Grinding Barley was in moderate demand, and rather high. Oats, at 18s. 6d. to 19s. 6d. per quarter from the rates of Monday last, and Peas, which continue very scarce, were the turn dearer. No quotable change occurred in the value of flat Maize, but round corn was 6d. per quarter higher. Oats met rather a better sale, and the market was firmer.

Dec. 22.—Wheat was very quiet, but there was rather more tone about the market at the close. Flour was in moderate request, with prices tending against buyers. Grinding Barley supported Monday's value, and met a moderate inquiry. Maling descriptions were dull of sale. Beans and Peas, of which the supplies continue in very poor compass, tended against buyers. Oats moved off slowly without quotable change in value. Maize was steady.

Average prices of corn for the week ending Dec. 13: 1st Wheat, 33s. 4d.; Barley, 19s. 7d.; Oats, 16s. 7d. For the corresponding period last year: 1st Wheat, 30s. 6d.; Barley, 29s. 3d.; Oats, 18s. 1d.

FRUIT AND VEGETABLES.

COLUMBIA (East London): Dec. 22.—Good supplies, and trade brisk at advanced prices. Quotations: Apples, 4s. to 7s. per bushel; Pears (eating), 5s. to 10s.; Apples, 2s. to 6s.; Cauliflowers, 1s. to 2s. 4s. per dozen; Spinach, 2s. 6d. per bushel; Brussels Sprouts, 2s. 6d. to 4s. per bushel; Cabbages, 2s. to 4s. per tally; Sawtoys, 2s. to 3s. 6d.; Greens, 3s. to 5s. per dozen bunches; Turnips, 2s. to 3s. 6d.; Carrots, 1s. 6d. to 2s. 6d.; do. 15s. to 30s. per ton; Onions, 4s. to 4s. 6d. per cwt.; Mangolds, 1s. to 1s. 6d. per ton.

STRAFORD: Dec. 21.—The market has been well supplied, and a good trade was done at the following prices:—Sawtoys, 4s. to 5s. per tally; Parsnips, 6d. to 1s. per score; Turnips, 2s. to 2s. 6d. per dozen bunches; 4s. 30s. to 40s. per ton; Carrots (household), 30s. to 25s. 6d.; cattie feeding, 30s. 31s. 6d.; Mangolds, 2s. 6d. to 17s. 6d. per ton; Sauer-kraut, 2s. 6d. to 3s. 6d.; Onions, 8s. 6d.; Watercress, 6s. per dozen; Celery, 10s. to 12s. per dozen rolls; Mistletoe, 10s. per crate; Holly, 1s. to 1s. 6d. per market bale; Apples, 2s. to 3s. 6d. per bushel; Horse Radish, 4s. to 1s. per bale; Laurels, 6s. per bunch; Box, 3s. 6d.; Sprouts, 6d. to 2s. per half-sieve.

THE GARDENERS' CHRONICLE

(Established 1841)

BENJAMIN FIELD, F.R.H.S., Horticultural Soil, Manures, Sandries, and Pottery, Swan Place, Old Kent Road, London, S E

Telegraphic Address—FLORICULTURE, LONDON

BEESON'S MANURE is the best for all Horticultural Purposes. Sold in tins, 1s., 2s. 6d., 5s. 6d., and 10s. 6d., or in cwt. bags, sealed, 15s. each. By all Nurserymen or Strengthen, or at Messrs. Carter & Burgess, Mill-Shed, Chelsea. Also pure CRUSHED UNOILED BONES, any size, and guaranteed of the best quality.

PEAT and SAND.—Light Brown Peat for Nursery and Greenhouse Work, in 4 or 1000 truck loads of 30 yards each, at 1s. 6d. per bag, and in bulk at 1s. 6d. per bag. Rhododendron and American Plant Beds, at 15s. per ton. Orchard Peat for 1000; Fresh Sphagnum, 10s. 6d. per ton. SILVER SAND, coarsest at 10s. per ton. WALKER and Co., Farnboro' Station, Hants.

THOMSON'S IMPROVED VINE and PLANT MANURE.—This valuable Manure is made up solely on our premises here. Every Bag and Tin has our Name on it. It can be had by all Nurserymen and Seedsmen, and direct from us, 1 cwt. and over carriage paid. Our London Agent is Mr. G. G. G. G., 10, Maria Road, Putney, S.W.

W.M. THOMSON and SONS, Cloudfords, Galashiels, N.B. K E L P — K E L P — K E L P — This powerful and stimulating Ash, made from the sulphur plants of Laminaria digitata and other selected seaweeds, is especially rich in Potash, and Phosphoric Acid. Mixed with three times its bulk of dry soil, its effect on Vine Borders, Tree to Plants, and nearly all Pot Plants, is marked and beneficial. While no better dressing exists for Potatoes, Peas, Seals, and Celery. It is an excellent Renovator for Old Garden Soil, and exhausted and Moss-grown Lawns. Price for each with order only, 6s. per bushel, one bag included. Carriage paid on orders of 2 bushels and over. N. P. FERRY, La Poudretterie, St. Martin, Jersey. The planer sorts especially chosen for this Ash can only be harvested during the spring tides of the four summer months, and then at some distance from the mainland, the supply is especially limited, and Orders will therefore be executed in strict rotation.

To Market Gardeners, &c. To Grow fine Vegetables and Flowers, Gardeners should use SULPHATE OF AMMONIA. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be used separately or mixed with ordinary stable or farmyard manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 12s. 6d. per cwt., or 7s. 2d. per 50 lb. P. O. Orders payable to THE MANAGER, Sheffield Gas Company, Sheffield.

FAWKES' Slow-combustion HEATING APPARATUS.
 —Most efficient and cheapest in existence. Requires no sunk stovehole and no brick setting. Will last all night without attention. Will burn house coinders, therefore costs next to nothing for fuel. Any one can fix it. A domestic servant can stoke it.

Boilers Delivered Carriage Paid from £2 10s

CROMPTON & FAWKES,
CHELMSFORD.

THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stove-hole, and no hot-water filter for fixing. The Boiler stands in the Greenhouse, the front only being outside, so that the whole of the heat from the Boiler is used in the house. It burns over twelve hours without attention, at a nominal cost.
 Price, as engraving, with Boiler, 6s 6d; delivered free with pipes cut and fitted ready for fixing—
 10 x 6 feet .. £4 14 0 .. 20 x 10 feet .. £7 0 0
 12 x 8 feet .. 5 10 0 .. 25 x 12 feet .. 6 10 8
 15 x 9 feet .. 5 10 0 .. 30 x 15 feet .. 7 10 0
 Proportionate prices for other sizes. Estimates free.
 Illustrated LIST, with full particulars of these and every description of Fuel, Gas, and Oil Heating Stoves free.

DEANE & CO.,

Rolled Plate, 3/4 in. size as 21-oz.

HENRY WAINWRIGHT, WHOLESALE GLASS WAREHOUSE, 8 and 10, ALFRED STREET, BOAR LANE, LEEDS.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manu factory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. From ALFRED LOWE, Esq., The Ryegate, Alteryth Lodge.

"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH, Brierly Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 136, Stephen's Green, Dublin.

Works on Gardening.

HANDY-BOOK OF THE FLOWER-GARDEN.—being Practical Directions for the Propagation, Culture, and Arrangement of Plants in Flower Gardens all the year round. Embracing all Classes of Gardens, from the largest to the smallest. With Engraved and Coloured Plans, illustrative of the various systems of grouping in Beds and Borders, by DAVID THOMSON, Gardener to His Grace the Duke of Buccleuch, K.G., at Drumlanrig. A New and Enlarged Edition, crown 8vo, 7s. 6d.

His author is entitled to great praise for the simple and clear manner in which he has explained the cultural directions, which, if carefully complied with, will enable the non-professional Horticulturist to grow plants as well as any gardener.

We are acquainted with the results produced by the able author, as well as with his book, and therefore can pronounce the book the best on the subject yet written or likely to be written for a long time to come.—The Field.

HANDY-BOOK OF FRUIT CULTURE UNDER GLASS. BY THE SAME. Second Edition, Revised and Enlarged. Illustrated with numerous Engravings. Crown 8vo, 2s. 6d.

No work of the kind of which we have any knowledge is at all to be compared with this. It is the result of ripe experience, close thought, and ample acquaintance with the subject in all its parts. There is nothing connected with the cultivation of fruit under glass that Mr. Thomson does not most lucidly explain; and the result is, that his book is one that ought to be in the hands of every gardener of every amateur fruit-grower, and, indeed, of every one who desires to know the best that can be known on the subject.—Scotsman.

New and Cheaper Edition.

A BOOK ABOUT ROSES. BY S. REYNOLDS HOAR, Eighth Edition, Revised, 2s. 6d.

His work may now be considered the most complete guide to this interesting branch of Horticulture art.—Saturday Review.

Once charming and instructive. The practical questions of position, soil, manure, and selection are carefully and exhaustively treated.—Standard.

It is the production of a man who boasts of thirty 'all England' Cups, whose Roses are always looked for anxiously at flower-shows, who took the lion's share in originating the first Rose-show *par excellence*, whose assistance as judge or critic is always courted at such exhibitions. Such a man 'ought to have something to say worth hearing to those who love the Rose,' and he has said it.—Gardener's Chronicle.

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE-VINE. BY WILLIAM THOMSON, Tweed Vineyard, Ninth Edition, Enlarged, 8vo, 5s.

We cannot too strongly recommend Mr. Thomson's treatise as a thoroughly practical and safe guide to the Cultivation of the Vine.—Journal of Horticulture.

We urge our readers to procure the work, and they will get 50 or an insight into Vine growing that a Viney will become one of the necessities of existence.—Field.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

L. REEVE & CO'S NEW WORKS. Centenary of the Botanical Magazine.

New ready, the New Botanical Magazine, for 1855, 42s. THE BOTANICAL MAGAZINE. Figures and Descriptions of New and Rare Plants. By Sir J. D. Hooker, K.C.S.I., &c. Published monthly, with six Plates, 2s. 6d. coloured. Subscription, 12s. 6d. Vol. 1 to 42, each the net of 42 volumes complete to date, £75 12s. 6d. with order.

With 48 beautifully Coloured Plates, 32s.

THE MARCISSUS: its History and Culture. By F. W. BURBIDGE, F.L.S., with a scientific Review of the entire Genus, by J. G. BURKER, F.R.S., F.L.S.

"It is no slight boon to have in so accessible a form so large a quantity of information on this subject.—Gardener's Chronicle.

"We have tested it on various points, and have found it thoroughly satisfactory in every particular.—Gardener's Magazine.

FLORAL PLATES, beautifully Coloured by Hand, 6d. and 1s. each. List of over 1000 varieties, one stamp.

BOTANICAL PLATES, or Plant Portraits, beautifully Coloured by Hand, 6d. each. List of nearly 2500 varieties, three stamps.

L. REEVE & CO., 5, Henrietta Street, Covent Garden, London, W.C.

BRITISH ORCHIDS,

Containing an exhaustive description of each species, to which is added Chapters on Structure and other Peculiarities, Cultivation, Fertilisation, Classification, and Distribution. P. 26s. 6d. from the Author A. D. WEBSTER, F.R.S.E., Llandegai, Bangor, North Wales.

A FEW OF

CARTERS' NOVELTIES FOR 1887.

"TEN DAYS EARLIER"
THAN
FIRST AND BEST."
(See below.)

The Earliest Pea in the World:
CARTERS' LIGHTNING PEA,

"FOUR DAYS EARLIER"
THAN
FIRST CROP OF RING-LEADER."
(See below.)

After exhaustive trial, and as the result of careful selection, we offer for the first time what we consider to be the EARLIEST PEA IN THE WORLD; and this opinion is fully confirmed by the testimony given below as the result of trials made by some of the best known gardeners in the country.

It is particularly level and neat in habit of growth, considerably harder and more robust in the haulm than any other First Early Pea, and a prodigious cropper, the pods being very long, usually hanging in pairs, and exceedingly well filled—distinct both in growth and seed—height about 2½ feet, the plant being literally studded with pods, containing Peas of fine colour and size, and of good flavour.

"I must say Carters' Lightning took the lead with any Peas this year. It was not sown so soon by a week as Ring-leader, and was fit to pick three days before that variety."—Mr. JAMES BEST, Head Gardener to His Grace the Duke of Hamilton.

"Carters' Lightning Pea, sown two months after William I., came into use before it."—Mr. W. COLEMAN, Head Gardener to the Right Hon. Earl Somers.

"Carters' Lightning Pea is the earliest Pea I have ever grown; it came in three or four days before Ring-leader."—Mr. E. WILSON, Head Gardener to the Most Noble the Marquis of Hartington.

"Carters' Lightning is very distinct and early. We gathered it ten days before Di-hon's First and Best, sown at the same time."—Mr. T. KARBONE, Head Gardener to the Right Hon. the Earl of Shrewsbury.

Price in Sealed Packets, 2s. 6d. per Pint.

A New and Distinct Dwarf Pea—CARTERS' ANTICIPATION PEA.

It is always gratifying when a ready and decisive public verdict confirms the value claimed by the raiser for a new introduction; and this is especially so in the case of Peas, where so many so-called new varieties are put upon the market from time to time, only to result in disappointment and annoyance to the purchasers, who speedily recognise old friends in new characters. We claim for "Anticipation" (which is the result of a cross between Ne Plus Ultra and an Early Wrinkled Dwarf Pea) complete and distinct individuality. In habit, and size, and shape of pod, for its enormous productiveness and delicious flavour, it remains unique. "Anticipation" grows to a height of about 2½ feet, and may be classed with the Second Early Peas, being 1½ full bearing with us on July 8. The habit of the plant is very robust, with immense straight pods, and the seed is very distinct. The following testimony fully bears out the description and report:—

"Carters' Anticipation is an excellent Pea in every respect, and fit to rank as a standard son."—Mr. F. HARRISON, Head Gardener to the Right Hon. the Earl of Derby.

"Carters' Anticipation Pea is decidedly good in every respect. It is a heavy cropper, and the pods are well filled with very sweet Peas."—Mr. W. IGGULDEN, Head Gardener to the Right Hon. the Earl of Cork.

"Carters' Anticipation is a most excellent Pea, of robust habit; although not more than 3 feet in height, the crop was a very heavy one, colour good, flavour delicious."—Mr. W. COLEMAN, Head Gardener to the Right Hon. Earl Somers.

Price, in Sealed Packets, 3s. 6d. per Packet. (Each Packet contains sufficient Peas to plant a row 20 feet in length.)

THE PHOENIX KALE—a Winter Necessity for Gardeners.

We have made arrangements with the growers (Messrs. CLARK BROTHERS & Co., of Carlisle) to introduce this new Kale to public notice. It is described by them as follows:— "About fifteen years ago we received seed of this Kale under the name of 'Shenan' (but upon trial we found it to bear no affinity to that variety) with a high recommendation of its delicate flavour, and a request to try it. During the extraordinary winter of 1879-80, when all vegetables were universally destroyed by the severity of the frost, which registered several degrees below zero, we observed that this Kale was the only green plant that remained, and as soon as the weather moderated we had an excellent crop of delicious sprouts. During the winter of 1885-6 we observe that the same success has attended our Kale, not a plant being injured, whilst nearly all the Broccoli, Brussels Sprouts, Curled Greens, &c., were destroyed. During the early spring months we had a large supply of sweet Sprouts."

In Sealed Packets, price 1s. 6d. per Packet. (We are the Sole Wholesale Agents for this Novelty.)

For further particulars see CARTERS' ILLUSTRATED VADE MECUM for 1887, price 1s., post-free; gratis to intending Customers.

Soldsmen by Royal Warrants to H.M. the Queen and H.R.H. the Prince of Wales.

237 & 238, HIGH HOLBORN, LONDON, W.C.

"THE CAMBRICS OF ROBINSON & CLEAVER HAVE A WORLD-WIDE FAME." } THE QUEEN.
